XIV. CONCLUSION IN THE CASE OF POLICY COORDINATION

One of the most heavily scored in the three 1951 investigations was that of the confusion which existed over responsibility in the field of foreign policy. There was no clear chain of command below the President. Practice had clearly obscured the role of the Secretary of State as the President's executive agent in the field of foreign affairs. Much of the Secretary's authority had been usurped by the Joint Chiefs of Staff during the course of World War II. The post-war era had found programs and policies in the possession of the Joint Chiefs of Staff and the Secretary of Defense as an independent agency with limited status and, by statute, gave the administration direct access to the President. However, the confusion was even worse than before. Separate agencies pursued their own courses of action and independent foreign policy was being set by the Joint Chiefs of Staff, while the President, with the aid of the Secretary of Defense, was being kept in the dark. In the other cases. In the foreign relations field, a lack of coordination and uncoordinated programs were being conducted simultaneously.

Foreign relations received the highest of scores to his traditional role; setting and all other policies.

were to receive policy guidance from the Department of State and clear their plans through that Department. The State Department was, in so far as possible, to restrict its own activities to policy-making and diplomacy. Overseas, to the American ambassador or minister in each mission was delegated the same responsibility within his purview as the Secretary of State was now to discharge within the United States Government. Policy was thus to be placed exclusively in the hands of the chief of mission and all agency programs would be under his control.

Reorganization Plan No. 8 and the three additional corrective actions laid a basis in 1953 for an effective psychological structure. It never emerged! The failure, once again, was basically a failure of top-level American officials responsible for policy formulation and execution. The OCB failed not only because it was structurally incapable of accomplishing the job set out for it, but also because it was permitted to develop, or grow away, from the concept from which it was born. The role of the President's Special Assistant for Cold War Planning was permitted to degenerate; it did not deteriorate of its own accord. Both of these deteriorations were directly the responsibility of President Eisenhower and lend credence to the observation that, like his predecessors, he neither understood nor placed appreciable store in the worth of psychological warfare, his frequent protestations to the contrary notwithstanding.

There were no restrictive policy guidelines from the Department of State and that State plans should have been developed. The State Department was, in the best of possible, to restrict its own activities to policy-making and diplomacy. Moreover, in the function, importance of the State in each mission was determined and the responsibility within the system was determined. The State was not to discharge within the United States Government. Policy was to be decided exclusively in the name of the United States and all agency proposals would be under its control.

XXV. THE KENNEDY ADMINISTRATION APPROACH

In January, 1960, John Kennedy, inherited the United States structure for Psychological War. Basically, there was but one tool available--the USIA. Kennedy's subsequent elimination of the OCB struck no new blow to psychological operations--the Board had ceased to contribute to a national psychological effort long before and, even before that, the impact of the Special Assistant for Cold War Planning had been eliminated.

Although a highly-classified Cold War Advisory Panel was created in the Department of Defense, the Kennedy Administration's failure to establish any machinery for the formulation of integrated psychological policy is a source for speculation. Possibly the attitude was that the administration was canny enough to "dead reckon" its way along. The tendency toward ad hoc solutions would serve to support this thesis. Perhaps the announced Presidential policy that each department head was solely responsible for the total effort of his agency was considered sufficient to insure that perfect staff work--both vertical and horizontal--would result in a magic integration. It seems hard to believe that this was the case, and there early developed some question as to the interaction of the functions of the Special Assistant for National Security Affairs and the Secretary of State with regard to the formulation of foreign policy. The

XIV. THE CURRENT ADMINISTRATIVE SITUATION

In January, 1950, John Kennedy, President of the United

States, delivered the following address to Congress:

"We are not too far from the point where we can begin to

eliminate the need for the use of force in the world."

Kennedy's address was a landmark in the history of the

United States, for it was the first time that the President

had spoken of the use of force in the world as a

problem.

United States Government is, simply, too vast to rely upon the belief that the complex interrelationship of all its departments can be ordered merely by informing each department head that he is responsible for running his department correctly. There is also the possibility that the Kennedy Administration was no more or less interested or knowledgeable in effective psychological operations than any other administration, and that it was satisfied to proceed with its only remaining tool, the USIA, in an attempt to obtain as much mileage out of the "campaign of truth" and news media facilities available as possible.

XXVI. THE USIA--1964

The USIA in 1963-1964 is a giant organization and under the very effective guidance of Edward R. Murrow, capable of giving Mr. Kennedy and, subsequently, Mr. Johnson much mileage. It employs over eleven thousand people--three thousand within the United States and the remainder staffing some two hundred and nineteen overseas posts in ninety-nine countries. This shift in emphasis from Washington to the field was a most significant factor in the effective development of the USIA. Previously, the field missions were essentially service organizations, receiving and disseminating material supplied to them by the home office. The result was that much of this mass-produced material was of little

or no value in a specific area. By shifting emphasis to the forward theaters, the specific area needs could be examined and dealt with on the spot within the limits established by policy from Washington.

With the expanding overseas program, the annual budget has also grown.³⁸ From 1954 to 1960, the budget varied from eighty-four to one hundred and four million dollars. In fiscal 1963, the figure climbed to one hundred and forty-three million, and a proposed 1964 budget of over one hundred and ninety million dollars was placed before Congress.

The extent of the USIA operation is impressive and encompasses the entire spectrum of communications media.³⁹ The Voice of America produces continuous short wave broadcasts to an estimated weekly audience of over twenty million people. It produces over seven thousand five hundred weekly hours of taped programs in twenty-seven languages which are made available to approximately two thousand five hundred local medium wave radio stations which, in turn, reach an additional forty-five million people a week. In the field

of television, video tapes and films of special merit are made available to stations in sixty-six countries serving fifty million sets and reaching approximately one hundred and sixty million people. The agency also maintains two hundred and ten film libraries in ninety-eight countries with each library having between five hundred to one thousand separate titles all in the native language. Where no theaters are available, USIA has a limited number of mobile units. The weekly audience for these films averages one hundred and fifty million people. In addition, the agency prints and distributes more than eighty magazines and newspapers, operates a worldwide radio teletype which runs to ten thousand words a day directed to eighty-three countries, operates almost two hundred libraries containing over two and one-half million volumes, and presents exhibits such as the Friendship Seven space capsule.

Technically and material wise, the USIA is exceptionally well equipped and is improving itself yearly. Its most effective director, Edward R. Murrow, enjoyed an improved, though less than adequate, participation in the formulation of psychological policy.⁴⁰ It is possible that this was a function of the prestige which Mr. Murrow brought

⁴⁰The following observations on Mr. Murrow's role in the policy-making process are drawn and inferred from a series of interviews with Mrs. Edna King of the Office of Public Information in the United States Information Agency.

[illegible][illegible]

to the Agency, and which, undeniably, was transferred to USIA. It will be necessary to observe the role of his successor, Carl Rowan, to determine the extent of this factor.

Mr. Murrow received policy guidance from the Secretary of State. With the elimination of the OCB, he lost his formal membership in the National Security Council Structure and seat, as the only observer, at the council table; this was somewhat compensated for by his designation as a "Special-Request Member" which gave him a standing Presidential Invitation to attend those Council meetings which were concerned with matters relating to his official responsibilities. It should be noted, however, that he attended as a "junior member," as a guest, not as an equal to the members designated by law and Executive Order. There does not seem to be any clear definition or guidance to indicate at what point his presence would not be required. The President sought his advice on the impact that policies would have on world opinion before and not after they were implemented. This was all well and good, but it was, of course, a one-way arrangement and could be considered as a valid source of policy formulation and guidance only so long as the President saw fit (or remembered) to consult Mr. Murrow. On occasion, he was asked to attend Cabinet meetings, but at unpredictable times. He was also included in small meetings with the President, the Special Assistant for National

to the Agency, and which, incidentally, was considered to
 vital. It was necessary to observe the role of his ap-
 parent, Carl Brown, in determining the nature of this Agency.
 Mr. Brown received initial guidance from the Secre-
 tary of State. With the allocation of the 1970, he took his
 formal membership in the National Security Council Executive
 Committee, as the only observer, at the Council's initial
 was somewhat complicated for his position as a
 "Special-Interest Member" which gave him a standing presence
 and invitation to attend those Council meetings which were
 concerned with matters relating to the official responsibilities.
 It should be noted, however, that he attended as a
 "Junior Member", as a guest, not as an equal to the members
 constituted by law and Executive Order. There have not been
 to be any special facilities or privileges in relation to such
 point his presence would not be required. The President
 sought his advice on the impact such policies would have on
 world opinion before and after they were implemented.
 This was all well and good, but it was, at times, a costly
 arrangement and could be considered as a slight source of
 policy formulation and guidance only to keep in the front-
 line the 110 (approximately) in Council of Advisors. On
 occasion, he was asked to attend certain meetings, but at
 unpredictable times. He was also included in small working
 With his assignment, the Special Assistant to the President

Security Affairs (Bundy), the Director of the State Department Policy Planning Council (Rostow), and the Secretary of State (Rusk). He did not participate in the Policy Planning Council's work. His representative sat with the Cold War Advisory Panel. All of this reenforces an underlying suspicion that USIA policy guidance is a "jury rig" and definitely ad hoc. The general flow is downward to the Agency and while there, quite obviously, is a degree of counter flow of advice and staff work to figure in national policy consideration, this input to the national policy machinery is in the nature of a guest performance and not as a permanent, integral factor.

XXVII. THE UNITED STATES REMAINS UNPREPARED

It would seem that in the last forty-six years, the United States Government has not yet concluded that the conduct of foreign affairs demands identification and consideration of psychological processes in every phase of international relations. The alleged increased participation of the USIA in our policy planning is rated by some observers as a distinct plus. A more restrained view is that it is, at least, not a minus. It is important that the people of the world hear and understand, as much as their intellects will permit, the position and policies of the United States. The fact that they hear and, hopefully, understand has no relationship,

necessarily, with their support for United States objectives. The danger in becoming euphoric over one's information activities lies in failing to recognize this limitation on what "truth" can do. An information program, undeniably, can have marked psychological effect. It is, however, but one psychological operation. Psychological war is a product of many psychological operations, carried on simultaneously, intensively, for indefinite periods, and so blended, one with the other, that the cause and effects of each weave together into a single integrated whole aimed at achieving national goals. The United States pays lip service to this theorem but has yet to turn its organizational and creative genius to the task of accomplishing such an integrated foreign policy.

necessarily, with their support for United States objectives. The danger in becoming euphoric over one's information activities lies in failing to recognize this limitation on what "truth" can do. An information program, undeniably, can have marked psychological effect. It is, however, but a psychological operation. Psychological war is a product of many psychological operations, carried on simultaneously, intensively, for indefinite periods, and so planned, and with the other, that the cause and effects of each weave together into a single integrated whole aimed at achieving national goals. The United States pays lip service to this theory but has yet to turn its organizational and creative genius to the task of accomplishing such an integrated foreign policy.

CHAPTER V

ANALYSIS AND COMPARISON OF SOVIET AND UNITED STATES EFFORTS

Any comparison of Soviet and United States efforts in the field of psychological operations must begin by noting the differences between the basic aims of foreign policy and the conceptions of how foreign policy is to be conducted.

I. INTRODUCTION

The Soviet Union is a revolutionary power with long-term ideological claims. Its leaders intend to further the socialist revolution throughout the world. Though different nations are at different stages, some more or less ripe than others, for one or another type of revolution, the road is essentially the same for all. The Soviet leaders are not necessarily in a hurry. Their determination to expedite the process of history does not impel them to adventurous or aggressive action. However, they are unshakeably convinced that their diagnosis of history is scientific, and they are constantly on the watch for opportunities to promote their cause.

The United States is conservative and defensive. It is not that American leaders do not also hold convictions, but that they do not plot, through their foreign policies,

REALITY AND CONCEPTION OF JUSTICE

THEORY OF JUSTICE

Any conception of justice and limited efforts to the limit of philosophical speculation must begin by asking the difference between the basic aim of justice policy and the conception of how justice policy is to be conducted.

1. INTRODUCTION

The justice issue is a revolutionary power after long-term ideological change. Its leaders intend to replace the traditional revolution throughout the world. They are different regions are at different stages, some more or less like the others, for one or another type of revolution, the goal is essentially the same for all. The justice leaders are not necessarily in a hurry. Their determination to achieve the progress of history does not imply that to achieve it by aggressive action. However, they are unambiguously convinced that their diagnosis of history is accurate, and they are unambiguously as far from the revolutionaries as possible.

CONCLUSION

The justice issue is conservative and defensive. It is not that justice leaders do not also have revolutionary, and that they do not give, through their justice policies,

to convert other nations. There is, of course, a strong strain of missionary zeal which is very dear to the American heart, but it cannot be said that the makers of United States policy have set themselves the long-term, ideological aim of converting the people either of the Soviet bloc or of the uncommitted countries to the American way of life. Rather, they are concerned to defend the United States national interest and to foster a world order in which all men are uninterfered with and free to choose their own way of life and government so long as in so doing they do not impinge upon the same rights of other states and men.

If, in the aims of policy, the Soviet leaders are doctrinaire and the United States government is empirical, in the choice of means the opposite is generally the case. In the United States, there is a great deal of public discussion, which can hardly fail to make itself felt within the Government policy machinery and Department of State, as to whether the United States should rely on military strength or economic action, on propaganda or negotiations. This "either-or-ism" must be incomprehensible to Soviet students of American affairs. In Soviet foreign policy, all available instruments are used, in whatever admixture the circumstances of the case would suggest.

II. ANALYSIS OF UNITED STATES EFFORTS

A democracy, by its very nature, contains certain

to control other nations. There is, of course, a strong
 sense of nationalism and this is very deep in the American
 heart, but it seems to me that the nature of United States
 policy have not themselves. The long-term, strategic aim
 at controlling the people kind of the United States or of the
 communist countries in the Western way of life. After
 they are committed to defend the United States nations
 interest and to force a world order in which all the
 universities with and free to choose their own way of life
 and government as long as it is doing good to the people
 and the same rights of other nations and men.

It is the aim of policy, the United States and
 the United States government is implied,
 in the choice of means the opposite is generally the case.
 In the United States, there is a great deal of public discussion,
 which has nearly led to make itself felt again
 the government policy machinery and department of state, as
 we should the United States should help to achieve through
 economic action, or cooperation or separation. This

II. AMERICAN POLICY TO THE UNITED STATES

A democracy, by its very nature, cannot be

inherent disadvantages in the conduct of psychological operations. The United States is a republic and a democracy and, consequently, subject to the sharp limitations which republican, democratic governments possess.

The United States cannot impose a purpose upon mankind. It cannot enunciate a policy and then hue to that line for years on end. Americans are not messiahs. The limitations of American civilization over and above those restraints imposed by American political institutions are such as to make it impossible for the United States to lead a fanatical counter crusade against communism or to guarantee to the world that America of 1963 can promise that America of 1975 will perform any particular action.

Limitations on Psychological Operations

American psychological operations are limited precisely because they are American. To be American means, to a certain degree, to be free. The American citizen has a definite influence and role in the operation of his government. A new election and a hostile Congress can cut off the funds for any project no matter what its merits may be in the eyes of the policy planners. The rest of the world is acutely aware of this fact, even though Washington politicians and bureaucrats sometimes seem to forget. The promise of a dictator is generally good for his lifetime. The promise of the United States is good only within the

letter of the law: a specific treaty, a definite commercial agreement, a very sharp and very narrow commitment. "In the propaganda field, America certainly is not promise."¹

The American strength in international affairs, therefore, does not lie in a propaganda capacity to promise, to threaten, or to commit the United States Government to future courses of action. The American strength lies in the immense probabilities of American life, in the virtual certainty that the American people will react in a positive manner to aggression; that the American people will, if attacked, fight in an implacable manner with every intention of destroying their attacker; and that the American people, despite their occasional shortcomings in matters of racial tolerance and political freedom, will, in the long run, be solidly ranged behind whatever policies seem to promise equality, prosperity, and freedom for all men.

The limitations on the United States as a source of propaganda are sharp. There is no United States party line; it is virtually impossible to imagine that within the American civilization, as it exists today, there could be one. There might be an official United States policy, unanimous and binding upon all Federal departments, but the Federal

¹Paul M. A. Linebarger, Psychological Warfare (second edition; New York: Duell, Sloane, and Pearce, 1960), p. 279.

Government itself, is only one among fifty-one separate governments operating within the United States of America. The state governments, the cities within the states, and the people-at-large are free to contradict what the Federal Government may say at any given point. Therefore, exploitation of United States propaganda strength must always be developed from the probable or apparent center of American opinion at that moment. It is impossible to find a United States policy which can be made compulsory and unanimous upon all Americans, both public and private. American policy planners are faced with the domestic requirement of devising foreign-policy programs which will command the decisive assent of the American people--this demands an adroit combination of leadership, foresight, and a keen awareness of domestic politics.

The Quest for Lost National Purpose

The less peaceful the world is, the more effective a "peacetime" psychological campaign can be. In times of obvious peril, the American people close ranks. In times of relaxation, they scatter in every direction. The American people seem to be incapable, psychologically, of carrying out a crusade without the external stimulus of danger and trouble. Once a war breaks out, Americans, heretofore, have shown an excellent capacity to unite in winning and finishing the conflict. The perplexing question, lies in how the

Government itself, is only one among many others. Governments operating within the United States of America, the State Government, the State of New York, and the Federal Government are all in constant contact with each other. Government may say to any other person, "I am not a part of the United States Government, I am not a part of the United States Government, I am not a part of the United States Government. It is impossible to find a United States policy which can be made compulsory and enforceable upon all Americans, both public and private. American policy makers are faced with the domestic situation of existing foreign-policy programs which will demand the domestic support of the American people--this means as before, organized as individuals, corporations, and a mass movement of domestic politics."

The Great and Last National Program

The last period of the war is the most effective of "positive" psychological weapons ever used. It is the time of the great war, the American people know this. It is the time of the American, they believe in every direction. The American people are in the position, psychologically, of getting out a certain amount of material stimulus of money and goods. Once a year, once out, American, American, they know we ourselves cannot be better in money and goods. It is the time. The psychological question, that is the

American people, short of involvement in war can develop the purpose, decision, and unanimity necessary to take those actions which will prevent war.

It has been a century since the Four Horsemen of the Apocalypse rode through the American countryside. America's sheltered and peaceful society has diverted the people into a timid and near sterile pattern of political thought. The "more abundant life," the quest for security, the adulation of the "common man" have been thematic byways down which the American people have wandered away from the highway of national character and purpose that built their magnificent country out of a howling wilderness. The character and purpose to which reference is so frequently made did not shrink from destroying the native population when such a course of action augured well for the security of a portion of the American people. Today, it is highly improbable that American exploration and colonization of another planet would be carried out in a comparable manner. Perhaps this is for the good. Brutality or atrocity generally breed more of the same. Nevertheless, it is the manifestation of purpose, the unalterable and unswerving dedication to doing what must be done to perpetuate this land and its system which has relaxed under the eroding effect of security.

Part of the answer probably lies in the field of education. The American people are still largely ignorant or

American people, about the Government in fact can develop the
 power, wealth, and material resources to face them
 nations which will follow us.

It has been a country since the first settlement of the
 settlement with through the American continent, America's
 history and present reality has always the people have
 a state and more serious pattern of political thought. The
 "new American life," the quest for reality, the realization
 of the common and more basic reality from which the
 American people have emerged away from the highway to

national character and people that will build together
 country not as a living wilderness. The character and
 progress to which nations is no frequently made the old
 value from destroying the native population when men's
 course of action requires well for the security of a position
 of the American people. Today, it is highly probable that
 American civilization and civilization of another planet

would be better off in a complete vacuum. Today this
 is for the good. Humanity is slowly becoming aware of the
 of the world. Nevertheless, it is the realization of the
 good, the material and immaterial dedication to solve
 that will be able to participate in the world and its system
 which has refused when the world effort is reality.

And of the world probably first in the field of sci-
 ence. The American people are still largely ignorant of

misinformed as to the nature of communism and its relationship to the power politics of the Soviet Union. A small start has been made in the public school systems of certain of the states. Florida now requires a course, employing the text The Meaning of Communism (Simon and Schuster) to be given in the last years of high school. It is hoped that such programs will spread. While the American possesses patience, endurance, and curiosity, the latter faculty is not generally directed along the historical or political veins. So long as a rational consensus or basis of understanding in these fields is not developed, to that extent will there continue to be just that much more impetus to this aimless drifting or lack of felt national purpose.

The never-ending complaints for a regenerated national purpose and the literary wringing-of-hands over the need for a rededication overlook the fact that it is not so much a matter of having lost but more a matter of having forgotten the already valid and existing precepts that the American people have developed. Here lies a challenge for the political leadership of the nation. It is a double challenge, for unless conducted scrupulously free of partisan and minority politics and free of a propaganda tone and motif it can never succeed. The propagandizing efforts of the Creel Committee amongst the American people have stood as a bar for forty-five years to governmental efforts to develop the requisite foundation of understanding which is necessary to

maintained as to the views of Communism and its relations

with the power politics of the Soviet Union. It will

also be seen from the public school system of certain

of the states. This is the kind of a course, regarding the

fact that the Communist Manifesto is in the

fact in the last years of the school. It is hoped that

each country will accept. While the American position

isolation, however, and certainly, the latter policy is

not generally shared since the historical or political

fact is that as a national movement, or basis of inter-

nationalism in many fields is not developed, so that without

will there continue to be that that were more limited to

this stage during at least in the American position.

The contemporary situation has a significant position

Europe and the literary situation in Europe was the need for

a revolution over the fact that it is not as much a

matter of having but not more a matter of having together

the already said and existing position that the American

people have achieved. There is a challenge for the political

and leadership of the nation. It is a double challenge, for

which the American people have to maintain and identify

themselves with the American people and with the world.

over the world. The propaganda efforts of the Soviet Com-

munist Party are the American people have since as a fact for

the first time in contemporary history in history the

political situation of internationalism which is necessary to

its policies. It most certainly is a responsibility of leadership to insure that the public is grounded and informed of the factors which determine the national future. This is no program for a series of press conferences or an occasional fireside chat; it is a long-term, continuing, integrated education effort that would require direct participation by the President and his most senior advisers.

Statement of the Problem

Over a decade ago, the crux of psychological war was ably annunciated by President Eisenhower in a campaign speech at San Francisco:

The present Administration has never yet been able to grasp the full impact of a psychological effort put forth on a national scale. What would such a peacetime of "cold war" national strategy mean? It would mean, in the first place, the selection of broad national purposes and the designation within these purposes of principal targets. Then it would mean this: every significant act of government should be so timed and so directed at a principal target and so related to other governmental actions that it will produce the maximum effect. It means that our government in this critical matter will no longer be divided into airtight compartments. It means that in carrying out a national policy every department and every agency of government that can make a useful contribution will bring its full strength to bear under a coordinated program. We shall no longer have a Department of State that deals with foreign policy in an aloof cloister; a defense establishment that makes military appraisals in a vacuum; a mutual security administration that, with sovereign independence, spends billions overseas. We must bring the dozens of agencies and bureaus into concerted action under an overall scheme of strategy. And we must have a

firm hand on the tiller to sail the ship along a consistent course.²

Beyond this clear annunciation, little advance has been made. Total strategies have never been fully developed or implemented by the United States. The strategies that have been employed have not provided for the integrated use of the four major instruments of foreign policy--the diplomatic, military, economic, and psychological. There are many reasons for this. The presidential form of government with its division of powers between the executive and the legislature imposes limitations on the probable amount of integration that can be developed. The democratic process itself inhibits the type of central control which can most readily achieve the coordination necessary to actual totality of action in the implementation of a decision. The inherent frictions that exist between Congress and the White House can and often result in budgetary or other restrictions on the scope of implementation of plans developed by the executive.

The aforementioned limitations are constitutional weaknesses which must be endured for the sake of the great strengths and rewards that the system simultaneously affords us. However, there are at least two additional areas which are blocked only by inertia or bureaucratic, vested interest.

²Speech delivered October 8, 1952, at San Francisco.

1. The first step in the process of identifying a problem is to define the problem. This involves identifying the symptoms of the problem and determining the scope of the problem. Once the problem has been defined, the next step is to identify the causes of the problem. This involves identifying the factors that are contributing to the problem and determining the underlying causes. Once the causes have been identified, the next step is to develop a plan of action. This involves identifying the steps that need to be taken to solve the problem and determining the resources that will be needed to implement the plan. Finally, the last step in the process is to implement the plan and monitor the results. This involves putting the plan into action and tracking the progress of the solution. Once the problem has been solved, the final step is to evaluate the results and determine if the solution was effective. This involves comparing the results of the solution to the original problem and determining if the solution was successful. If the solution was successful, the final step is to document the results and share the information with others. If the solution was not successful, the final step is to identify the reasons for the failure and determine if the solution needs to be revised.

[illegible]

The statement indicates that the information was not provided to the committee and that the committee was not aware of the information. The statement also indicates that the information was not provided to the committee and that the committee was not aware of the information.

It is in these areas where effective Presidential leadership and sound organization can produce a total diplomacy or total strategy. In fact, it has always been in these areas where the answer has lain, and, in the harsh light of responsibility and accountability, the failure of the United States Government to develop this totality of effort has been solely the responsibility of its Chief-Executive-Officer--the President of the United States.

The Multiplicity of Agencies

The first of these correctable areas centers on the problem of the multiplicity of agencies with overlapping authority and responsibility which stultify the foreign policy decision-making apparatus within the executive branch. In such a vast operation, it is literally impossible to develop a neat series of compartmentalized units which are pure unto themselves. Such an organization could never work for the simple reason that each is, in some degree, dependent upon the other and finds implications of all the tasks performed by the other agencies within its own field. Therefore, the line of attack should be through the "coordinating" machinery and not by successive layering of agency upon agency or by ad hoc, "shooting from the hip," emergency methods of dealing with individual situations as they arise. Since World War II, there has been a stately procession of

It is in these areas that the most serious problems are found. In these areas, the Government has a special responsibility. It is the duty of the Government to ensure that the people have access to the services they need. This is especially true in the case of health care, education, and social services. The Government must ensure that these services are available to all people, regardless of their income or social status. This is a fundamental principle of justice and fairness. The Government must also ensure that these services are of high quality and that they are delivered in a timely and efficient manner. This is a challenge, but it is one that the Government must meet if it is to fulfill its duty to the people.

The Role of the Government

The role of the government is to provide a framework within which the private sector can operate. This framework should be based on the principles of justice, fairness, and efficiency. The government should ensure that the private sector is able to operate in a free and open market, without undue interference. At the same time, the government should ensure that the private sector is held accountable for its actions. This is especially true in the case of public utilities, where the government has a special responsibility to ensure that the services are provided at a reasonable cost and that they are of high quality. The government should also ensure that the private sector is able to access the services it needs to operate, such as land, labor, and capital. This is a fundamental principle of justice and fairness. The government must ensure that these services are available to all people, regardless of their income or social status. This is a challenge, but it is one that the government must meet if it is to fulfill its duty to the people.

"coordinating" committees or boards. All have been formed with the best of intentions; each has represented some improvement; and the late OCB even offered promise. All have failed for the same reason--their titles hold the key:

"Coordination." If any country should have had its fill of this term, the United States would rank at the very head of the list. From the days of the Continental Congress when "Congress could beg, plead, and implore, but it could not command," this nation has had nothing but the most unfortunate experience with "coordination." The entire history of the American people indicates that they simply do not "coordinate" of their own free wills. The vernacular of the Marine gunnery sergeant, "semper fie, I've got mine, how are you doing?" seems to express the attitude; it probably lies deeply grounded in the independence bred of the frontier experience which is part of American heritage. It cannot be tolerated within an administrative organization, yet it has been tolerated. Eisenhower virtually prostituted his San Francisco campaign speech of 8 October 1952, with the coordinative mandate expressed in the promulgation of the OCB. Probably his concept of military "coordination" colored his judgment of the effectiveness of a civilian, interdepartmental coordinating board. Having lived all one's life in the glowering shadow of the Articles of War, it would be very easy to overlook the absence of such an impelling

[illegible]

incentive to effective coordination. That there is no such sanction renders the coordinating concept useless in the face of vested bureaucratic practices.

The Lack of Understanding

There is a second reason for the United States failure to develop total strategies. American leaders have never truly understood the nature of psychological operations; and, because the full implications of these operations have not been understood, they have never been fully exploited. Although the history of psychological policy implications can be traced back to earliest recorded time, traditionally, psychological operations were not recognized as a separate instrument of statecraft. This was probably due to the very narrow, special audience against which the implications of the traditional tools--diplomacy, military force, and economic activities--were used, whether singly or collectively. However, in the twentieth century, for the first time, it has become possible for the leaders of one nation to communicate directly with the population of another nation. Simultaneously, there has been an immense expansion of the potential or actual power base of a society. Even the most totalitarian of today's dictatorships is forced to solicit the active support of its subjects, whereas its predecessors could exist with mere passive acquiescence. Thus, the new-found power of the masses and the ability of a

foreign power to speak directly to these masses have raised the psychological tool to a level comparable with that of the three traditional instruments.

American Conceptions and Misconceptions

The American concept of psychological warfare has always been tainted with a suspicion of the instrument. Part of this stems from the American public's fear of being influenced psychologically by the government--a fear which is inevitable to a certain degree. This has been reenforced by the spectre of Nazi, Soviet, and Chinese psychological operations and propaganda. There is also the influence of the intriguing "all-American boy" complex that is periodically manifest in a preoccupation with a variation of the Marquis of Queensberry rules in so far as international relations are concerned. The U-2 incident was disturbing to many people simply because we were occupied in spying (and blatant spying at that), not because we got caught at it. The pathetic performance put on by every senior official concerned was capped only by the even more pathetically noble assumption of responsibility by the President. Of course, he was responsible! And every international politician knew that. The public expiation of this international sin was a reflection of the American bent of character which is somehow ashamed of anything that smacks of the underhanded or devious. Under this spell, the word

thought, even to speak honestly to those whom they regard
the psychological test as a useful psychological instrument
and whose practical instruments.

Psychological Instruments and Psychological

The American concept of psychological testing has
always been tainted with a suspicion of its instrument.
Part of this stems from the American public's fear of being
influenced psychologically by the government—a fear which
is responsible for a certain degree of hostility has been manifested
by the rejection of Nazi, Soviet, and Chinese psychological
operations and propaganda. There is also the influence of
the widespread "all-American day" complex even in political
unity matters in a psychological sense with a suspicion of the
methods of governmentality roles in order to international
relations are concerned. The U-S incident was disturbing to
many people simply because we were occupied in trying to
assist Syria in Syria, and because we had helped to
the political situation was so very serious ethical
concerns and helped only to the very least politically
make a reputation of responsibility by the President. In
context, it was responsible and every individual's
action was good. The public reaction to this action
factual and a reflection of the American heart of
concern which is deeply rooted in the history of the nation
of the relationship to history. Under this spell, the word

propaganda has meant something evil. It has meant the dirty weapon of the opponent. Extensive literary effort has been expended to develop some nice, clean, unalarming substitute for such terms as psychological war and propaganda—evidently on the assumption that a rose by any other name will somehow not smell like a rose.

American Usage and Propaganda

Psychological warfare and psychological operations, in American usage, have come largely to connote propaganda. The earliest large-scale experience of the nation was in World War I with the efforts of the Creel Committee. This was primarily a propaganda campaign based almost entirely upon an expansion of domestic advertising techniques. Two basic misconceptions have generally expressed themselves in all American psychological warfare programs ever since. The first is the idea that the conduct of psychological warfare and propaganda is just like advertising. The second is that foreigners think, or wish to think, like Americans.

There has been, for many years, a wide-spread belief that, since Americans are smart advertisers, all that the government needs to do is project this domestic form of agitation on a worldwide basis. Yet this approach is precisely what the world situation does not require. The United States is dealing with a world revolutionary situation involving races, cultures, and aspirations totally alien to American

propaganda has meant something well. It has meant the story
 weapon of the opponent. Extensive literary effort has been
 expended to develop some nice, clean, unassuming substitutes
 for such terms as psychological war and propaganda—vi-
 sibly on the assumption that a loss in any other name will
 somehow not entail like a loss.

Psychological Warfare and Propaganda

Psychological warfare and psychological operations,
 in American usage, have come largely to mean propaganda.
 The earliest large-scale experience of the nation was in
 World War I with the efforts of the Great Committee. This
 was primarily a propaganda campaign based almost entirely
 upon an operation of domestic advertising techniques. Two
 basic misconceptions have generally persisted themselves in
 all American psychological warfare programs ever since. The
 first is the idea that the content of psychological warfare
 and propaganda is just like advertising. The second is that
 propaganda itself, or what is known, like advertising.

There has been, for many years, a wide-spread belief
 that, since advertising is meant to advertise, all that the
 government needs do to to project this message form of ad-
 vertising as a technique basis. The fact is that in general
 what the world situation does not require. The United States
 is dealing with a world revolutionary situation involving
 racial, cultural, and religious conflict which is American

experience. Political propaganda is a task of extraordinary complexity and demands the most skilled and sophisticated American political guidance.

What is Good for the United States is Good for the World

Since the earliest days of the Republic, Americans have demonstrated a national ethnocentrism. The New World was, in fact, new, and it bred a new type of man, a new set of values, and new outlooks. Those who did not develop returned to Europe or were swallowed up in the process of the development of American culture. The period of the nineteenth century, during which the great focus of American attention was turned inward to continental consolidation, reenforced the opinion that the American way was a superior way; the spectacular growth which burst forth in the last quarter of the nineteenth and early decades of the twentieth centuries served as proof of the theorem. The American inclination to assume that what was good for America was good for everyone, the tendency to disregard the basic interest and outlooks of the foreign audiences to which America has addressed itself stem from this experience. Consequently, factual statements that the American working man or farmer has a carpet in his home, shoes for all his children, an automobile of his own, and liberty to do as he pleases are regarded as blatant lies by the Transcaucasian

experiment. Political propaganda is a case of extraordinary complexity and demands the most skillful and sophisticated American political methods.

What is Good for the World is Good for the World

Since the earliest days of the Republic, Americans

have demonstrated a national ethnocentrism. The New World was, in fact, new, and it had a new type of man, a new type of society, and new outlooks. Those who did not desire to be taken to Europe or were unwilling to do the business of the development of America refused. The failure of the first

search country, which was the first of America.

America has never been an essential commodity,

remained the same since the American way was a superior way, and superior (which was the first of the first)

order of the American and early decades of the twentieth century. There is proof of the fact. The American

inclination to believe that there was good in America was

good for everyone, the tendency to disregard the basic in-

crease and decline of the people's welfare as well as

America has accepted much from this experience.

Consequently, the American people have been working

and in fact have a major in the way, there has been

change, an increase of the way, and thereby to the way

change has resulted in the way by the American

change has resulted in the way by the American

peasant, who simply cannot imagine that one worker or farmer could possibly own such tangible and intangible things.

There has been a realistic trend away from this form of propaganda as the USIA has matured. The non-governmental media of communication, however, film, television, and magazines still convey this message and under the American system cannot be restrained from so doing. This poses an even greater problem for the USIA, for America possesses no revolutionary ideology to fire imaginations and to substitute for the material yearnings of the less-developed peoples of the world. Unfortunately, "you can't fill the baby's bottle with liberty";³ and there is the ever-present danger of talking only to one's friends who already share American expectations and thereby losing "the great majority of mankind that is still searching for a hope and a vision."⁴

III. ANALYSIS OF SOVIET EFFORTS

When one pauses to contemplate the use that the Soviet Union has made of the psychological tool, one cannot fail to be impressed by the efficient and workmanlike manner in which psychological operations have been woven through

³Saul K. Padover, "Psychological Warfare and Foreign Policy," Propaganda and International Relations, Urban G. Whitaker, Jr. (ed.) (San Francisco: Chandler Publishing Co., 1962), p. 143, cited from a quotation of Maury Mavencck.

⁴Ibid.

possess, who simply cannot imagine that the world is a place
where people are not free to do as they please.

There has been a certain amount of talk in the
of propaganda as the only way to win the war. The non-governmental
media of communication, however, this, television, and radio
which still convey this message and know the American system
cannot be restricted from its work. This power is even

greater power for the U.S. for America possesses an ever-
increasing ability to find imagination and to create
for the mental freedom of the free-speech people of
the world. Unfortunately, you can't tell the world's people
with liberty, and there is the ever-present danger of false-
hood only to our friends and already some American sup-
porters and thereby losing the great majority of world
people is still searching for a hope and a vision.⁴

III. ABILITY OF CIVIL WORKERS

When we speak of mobilizing the war effort the
civilian side we mean it in psychological terms, not merely
that to be impressed by the physical and economic means
in which psychological operations have been used through

¹Paul E. Johnson, "Psychological Warfare and Foreign
Policy," *Psychological Warfare*, June 5,
1945, p. 141. (The author is a member of the
1945, p. 141, which has a quotation of many sources.)

the Soviet system. This does not mean that free men should adopt a similar course, but it does indicate that psychological operations can be effective. The United States would be foolish not to recognize the operational strength of the Soviet structure and profit from those lessons which may be drawn in the light of the American experience.

A Total Program

The goals of Soviet foreign policy have been achieved and projected in terms of all resources, capabilities, and the entire machinery of Government. In Soviet hands, psychological operations have proven to be both flexible and responsive to initiative. Time after time in the last twenty years, the speed and efficiency with which the Soviets have moved from a military posture to political action and thence to economic pressure have caught the United States unprepared with any reply except one devised under the impelling pressure of the latest challenge.

Perhaps the single most striking feature of the Soviet effort is its totality, for the Soviet operation is an organizational one, and its strength lies in the rise of organization as a weapon. It is not the power of persuasion so much as it is the power that flows from a dedicated, disciplined, ruthless Combat Party.

The Soviet system. This does not mean that there are no
 ways a similar system, but it does indicate that a
 logical conclusion can be reached. The Soviet system
 would be foolish not to recognize the operational strength
 of the Soviet structure and apply it to the same issues with
 any the system in the light of the American experience.

A Total System

The issue of Soviet foreign policy have been addressed
 and projected in terms of all resources, capabilities, and
 the basic machinery of government. In Soviet hands, per-
 ceptions of operations have proven to be more realistic and
 responsive to reality. This does not mean that the Soviet
 leadership is not efficient and effective with which the Soviet
 have shown from a military point of view. The Soviet Union
 stands as a powerful presence in the world. The United States
 cooperation with any single country and divided under the in-
 falling pressure of the latest challenge.

Perhaps the single most striking feature of the
 Soviet effort is its reality. For the Soviet system is
 an operational one, and its strength lies in the fact of
 organization as a weapon. It is not the power of persuasion
 as much as it is the power that flows from a dedicated,
 almost fanatical, belief.

The Soviet Value System

The national values which ground the employment of the Combat Party derive from Marxist-Leninist Bolshevik doctrine, portions of which have expanded and contracted, mutated and atrophied as the Soviet Union has progressed from the virulent, but "have not," revolutionary stage to the status of a great world power, rich and growing richer--a definite "have" state. Nevertheless, the communist ideology underlies the organizational and operational frame of the nation.

There exists a considerable body of opinion that holds that this Bolshevik ideology has little or no bearing on the operations or planning factors of the USSR. The observation that "dialectical materialism affected Stalin . . . (and by implication any of the Soviet leaders) . . . about as much and as little as the doctrine of Christian charity affected Ivan the Terrible" is picturesque and perhaps of value, in a rhetorical sense.⁵ Such opinion maintains that the confrontation of the mid-twentieth century is a derivative of pure power politics, and that its polar star is power--nothing more nor less. This approach neglects the important role of values in the development of national goals and a national security policy. The leaders of the

⁵Robert V. Daniels, "What the Russians Mean," Commentary (October, 1962), p. 47.

The Soviet Value System

The national values which govern the development of the Soviet state derive from Marxist-Leninist principles and, therefore, of which have expanded and contracted, changed and developed as the Soviet Union has progressed from one phase to the next, but these are revolutionary steps in the direction of a great world power, rich and growing, rich and powerful, rich and strong. Revolutionary, the communist ideology underlies the organizational and operational forms of the nation.

There exists a considerable body of opinion that holds that this Soviet ideology has little or no bearing on the questions of internal factors of the USSR. The observation that "classical Marxism-Leninism affected little or no change in the way of the Soviet leaders" . . . and by implication, that the Soviet Union is about as much as little as the doctrine of Christ. Similarly affected even the "terrible" is the doctrine and the form of value, in a spiritual sense, and which remains the same that the foundation of the Soviet Union is a derivative of the Soviet doctrine, and that the Soviet Union is a derivative of the Soviet doctrine. This approach requires the important role of value in the development of national goals and a national security policy. The leaders of the

¹Robert V. Daniels, "What the Soviet Union Means," Foreign Affairs (October, 1951), p. 47.

Soviet Union believe in their value system--Marxist-Leninism--as firmly and deeply as their American counterparts believe in democracy. It is no more possible to claim that Soviet foreign policy is conceived independent of that nation's value system, than it is to hold that American values are eliminated during the development of United States policy.

Unless we are able to devise political tactics and an organizational plan based precisely upon calculations for work over a long period of time, and at the same time, in the very process of this work, put our party in readiness to spring to its post . . . at the very first, even unexpected, call, as soon as the progress of events becomes accelerated, we will prove to be but miserable political adventurers It would be a grievous error indeed to build up the party organization in the expectation only of outbreaks of street-fighting, or only upon the "forward march of the drab, everyday struggle." We must always carry on our every day work and always be prepared for everything, for very frequently it is almost impossible to foresee beforehand when periods of outbreaks will give away to periods of calm. And even in those cases when it is possible to do so, it will not be possible to utilize this foresight for the purpose of reconstructing our organization, because . . . these changes from turmoil to calm take place with astonishing rapidity.⁶

Thus, in 1902, Lenin enunciated the basic organizational requirements for flexibility and long-range planning with no sharp distinction between words and deeds or between psychological or military warfare.

⁶Vladimir Ilyich Lenin, Collected Works (New York: International Publishers, 1927), pp. 4 and 244-245.

...the same belief in their value system--

...is likely to be their American counterpart--

...It is no more possible to claim

that Soviet foreign policy is conceived independently of this

national value system, than it is to claim that American

values are influenced solely by the development of United

States policy.

...we are able to derive political parties and an

organizational plan based exclusively upon rational

for with such a long period of time, and at the same

time, in the very process of this work, but our party

is likewise so going to its goal . . . at the very

first, even unprepared, well, as soon as the program

of work is once established, we will prove to be

not a political party . . . It would

be a serious error indeed to believe the party

organization in the expectation only of members of the

street-fighting, or only upon the "forward march of the

army, everyday struggle." We must always carry on

our every day work and always be prepared for every-

thing, for very frequently it is almost impossible

to foresee beforehand when periods of activity will

give way to periods of calm. And even in times

when it is possible to do so, it will not be

possible to realize this forecast for the purpose of

reorganizing the organization. . . . This

changes from period to period, from one activity-

ing tendency.

Thus, in 1901 Lenin introduced the basic organiza-

tional requirements for flexibility and long-range planning

and no sharp distinction between work and periods of between

periods of activity and periods of calm.

International Encyclopedia, 1911, pp. 4 and 44-45.

The Department of Propaganda and Agitation

To accomplish this organization, control of psychological operations is located at a very high point in the hierarchy of the government. The Department of Propaganda and Agitation, located within the Executive Staff of the Party Secretariat, exercises vast authority. This mandate touches every form of activity which might conceivably influence opinion. It functions as the planner, director, and supervisor for all media. Its mission includes that of providing the Presidium and Central Committee with analyzed data upon which these two high policy bodies can act in the development of a total national policy. The Department supervises the rigorous political education program from which it develops and maintains a well-trained and well-informed Combat Party structure throughout the world.

Agitatsya i Propaganda

Soviet Russia is the first nation in history to produce such a trained class of full-time propagandists, administrators, agitators, and organizers in a Combat Party. Contrary to the democratic attitude towards propaganda and psychological warfare and those who conduct it, AGITATSYA i PROPAGANDA are honorific words in the Soviet Union. They are honorable because the importance of these activities in the pattern of world revolution is recognized and respected. Consequently, the "psychological troops" have a sense of

mission, a sense of contributing to the National destiny. Such regard is not accorded to American operators by their nation. Since there is no such division or separation of political, military, and civilian planning and executive efforts as exist within the American governmental structure, the Soviets experience little trouble in extracting the maximum psychological return from the integrated, total policy.

The Soviet Concept of Public Opinion

There are additional factors that render the organization of the Combat Party even more formidable. One of these lies in the fundamental distinction between public opinion as it is conceived in a democratic state and as it is conceived in the USSR. A democracy regards public opinion in terms of citizens freely taking a stand on an issue of public importance. The various media of mass communications are operated so as to present facts on which citizens may make up their minds on any given issue--the creation of diversity of opinions is encouraged. Through a process of free elections, the majority opinion is expressed and the government is modified accordingly. In the Soviet Union, quite the opposite is the case. A highly-organized central control of the media of mass communications is manipulated as a guide since the reader looks at the official communications to discover the correct position--not to find

mission, a number of countries in the Eastern Hemisphere
such regard is not accorded to American operations by their
action. Since there is no such desire for recognition of
political, military, and civilian freedom and assistance
through the United States the American government's attitude
has positive experience with America in extending the
maximum psychological support from the information, both
policy.

The United States of Public Opinion

There are additional factors that concern the opinion-
public of the United States very much. The public
is in the fundamental distinction between public
opinion as it is conceived in a democratic state and as it
is conceived in the East. A democratic state public
opinion is based on citizens freely making a choice as to
forms of public expression. The various media of mass com-
munication are regarded as an integral part of public
opinion and are not up to their eyes in the public
opinion of citizens. The public opinion is regarded as
public opinion of the citizens. The public opinion is regarded
and the government is regarded as a public opinion. In the United
States public opinion is regarded as a public opinion.
public opinion of the public of mass communication is
regarded as a public opinion. The public opinion is regarded
communication for discussion and public opinion and to find

conflicting arguments from which he may make up his mind. The Party and its communications serve to mobilize and formulate public opinion on all important issues. This is not to ignore the state of public attitudes and understanding, however. The Department of Propaganda and Agitation is careful to maintain a close evaluation of the attitudes of the masses so as to be able to estimate how ready they are to support a given policy. Once the direction and intensity of the attitudinal winds are determined, the Department then guides the vanguard and persuades or coerces the laggards. The elections which are held are designed to provide a symbolic expression of this unity. The change which follows such an election will not be reflected upward but downward. The state continues along a predetermined course and the population is expected to conform to the established Party line.

Scope of Operations

The sheer size and variety of the combat resources available are staggering. In all the Soviet world, the entire communications system is at the service of the Party. In any part of the world where the Combat Party functions, it may draw on as many of the proved devices as it can maintain. Furthermore, this Soviet program is a total program. The Combat Party at work outside the Soviet orbit may be

conflicting arguments from which he may select his final
 The Party and its communications serve to enlighten and in-
 struct the public opinion on all important issues. This is not
 to ignore the state of public opinion and understanding,
 however. The department of propaganda and agitation is
 careful to maintain a close evaluation of the opinions of
 the masses so as to be able to estimate how ready they are
 to support a given policy. Once the direction and intensity
 of the systematic work are determined, the Government then
 defines the viewpoint and pattern to promote the interests.
 The education system and the press are designed to provide a vir-
 tuous expression of this policy. The change which follows
 such an education will not be reflected through the country,
 the entire movement being a predetermined order and the
 population is expected to conform to the established party
 line.

Scope of Education
 The scope and variety of the modern educational
 system are expanding. In all the world, the
 public communication system is at the service of the Party.
 In any part of the world where the Communist Party functions,
 it has been or is about to be given priority as its main
 task. Furthermore, this public system is a social system.
 The Communist Party is now making the Soviet Union may be

expected to approach its targets with every weapon that is available and appropriate.

It has been estimated that the cost of the most direct means, measures stemming from the professional propagandists, amount to at least five hundred million dollars a year. Indirect means of operation appear in the form of support for parallel organizations that do not openly avow the communist ideology but covertly follow the directions of Moscow; in infiltration tactics employed in schools, churches, trade unions, the press and most other communications media; and in the promotion of various front organizations which are directed at specific objectives such as the anti-European Defense Community campaign and the Stockholm Peace Appeal, as well as in the popular front movement which embrace nationalistic aspirations. When these are all added together they represent an immense psychological effort. A rough estimate is that the entire program involves the utilization of five hundred thousand men and an annual expenditure of some two billion dollars.⁷ In comparison, the USIA's total budget is more than matched by the Soviet expenditures simply to jam the Voice of America.⁸ This gigantic total is

⁷United States Congress, Senate, The Technique of Soviet Propaganda (Washington: Government Printing Office, 1960), pp. 2-17 passim.

⁸Edward R. Murrow, Who Speaks for America (Washington: United States Information Agency Office of Public Information, Press Release No. 24, May 24, 1961), p. 13.

expected in programs for targets with every weapon that is available and appropriate.

It has been estimated that the loss of the world

direct means, measured according to the professional people, amount to at least five hundred million dollars a year. Indirect means of operation appear in the form of support for political organizations that do not openly show the

communist ideology and eventually follow the direction of

activity in international action engaged in schools, churches, trade unions, the press and most other communications media; and in the promotion of various kind organizations which are

directed at specific objectives such as the anti-Soviet defense community campaign and the American Youth Appeal, as well as in the popular front movement which unites nationalistic organizations. These three are all added together

they represent an immense psychological effort. A rough estimate is that the entire program involves the utilization

of five hundred thousand men and an annual expenditure of some two billion dollars.⁷ In comparison, the USSR's total

budget is more than matched by the Soviet expenditures simply to run the police of America.⁸ This gigantic task is

⁷United States Congress, Senate, The Committee on Governmental Organization (Washington: Government Printing Office, 1967), pp. 1-11 (passim).

⁸Thomas A. Knutson, Who Speaks for America (Washington: United States Information Agency Office of Public Information, Press Release No. 24, May 24, 1961), p. 12.

one indication of the value placed on propaganda and the worth of psychological operations.

Role of the Philosophy of Class Struggle

The philosophy of class struggle conceives of every group not dominated by the Party as an enemy and permits no solution to world tension until the Party dominates all other groups--or is itself destroyed. The Combat Party is not a political party such as democratic countries are accustomed to foster and protect, but, rather, an instrument of war in a conflict which the Communists expect ultimately to win.

It would be a great mistake to believe that a peaceful agreement about concessions is a peaceful agreement with capitalists. This agreement is equivalent to war.⁹

In the face of this point of view, so often and clearly stated, it is hard to believe that a settlement between the Soviets and the United States, by which they can live together indefinitely in peace, is conceivable to the Party leaders. On the other hand, arrangements with the United States, "codifying the momentary relationship of forces"¹⁰ and permitting time to regroup forces for the next advance, are possible and often desirable.

⁹Nathan Leites, The Operational Code of the Politburo (New York: McGraw Hill, 1951), p. 88, quoted from Lenin.

¹⁰Ibid., p. 90.

The Worldwide Opinion Campaigns

The great worldwide opinion campaigns are notable for their length and for the skill with which changes and variations were introduced so as to maintain interest over a long period. They all illustrate the choice of agitational material for wide and continued psychological operations. The peace campaign, the germ warfare campaign, the disarmament campaign, the peaceful coexistence campaign: they are all grounded in tensions of great potency and wide extent. The world is sick of war. The world is fearful of what Chemical-Biological-Radiological (CBR) warfare may bring. The world dreads the possibility of a thermonuclear exchange. In the latter case, the people of Asia are keenly aware that the United States has employed the nuclear weapon only against the yellow people of the Far East. These themes lend themselves to all kinds of specific as well as "rigged" events and evidence. In addition, they possess the beauty of being susceptible to simplification down to the level where the agitator can operate most effectively.

These campaigns have also served as most effective political lubricants for Soviet foreign policy. In his report on "Peace and War," made during the Seventh Congress of the Russian Communist Party, following the signing of the 1918 Brest-Litovsk peace treaty with Germany, Lenin established the fundamental pattern for the communist peace strategy:

The American Culture Campaign

The great worldwide culture campaign are certain for
 each temple and for the still with courage and val-
 iant men introduced as to maintain interest over a long
 period. They all illustrate the power of spiritual re-
 sistance for life and sustained psychological resistance. The
 power remains. The great culture campaign, the literature
 campaign, the political consciousness campaign, they are all
 grounded in a sense of great power and great values. The
 world is rich in it. The way is found in the Christian-
 ity of the world. The world is rich in it. The world
 stands the possibility of a tremendous campaign. In the
 future, the power of the mind and the power of the
 United States has enjoyed the nuclear power only against
 the future people of the world. The future is not
 better to all kinds of people as well as "right" people
 and violence. In addition, they have the power of the
 world to a civilization for the world and the
 system and people with violence.

These people have also moved as well as the
 political resistance for great future people. In the
 report on the world and the world, the world is moving
 of the Russian Communist Party, following the signs of the
 1918 world-wide people with violence. The world
 lived the political power for the world.

1. Compare strengths and avoid war under unfavorable circumstances.
2. Peace negotiations are a means of accumulating power and should be used to seek temporary respite in preparation for new wars.
3. Be willing to retreat so as to plan for future attacks. If all men cannot be withdrawn in complete safety, at least try in half safety. Never hesitate to counter-attack in order to take the best advantage for all chances and opportunities.
4. Trade space for time.
5. Divide the enemies' strength and secure the fruits of revolution. Take maximum advantage of mistrust and discord within the enemy.
6. Crawl in deep mud to brew world revolution.
There is nothing to which one cannot or must not resort in order to accomplish one's goals.

Thus Lenin projected the teachings of Marx and Engels who, when faced with serious defeats or frustrations, were always ready to resort to the so-called "peaceful" strategies. Engels, in this connection, held that on occasion one might be forced by circumstances to accept a compromise. When so confronted, however, the true revolutionary aim must never be abandoned; rather, with it firmly fixed in mind,

[illegible]

under whatever circumstances, its ultimate achievement must be pursued.

Stalin wielded the "peace strategy" weapons most effectively. During his dictatorship, the "united front" and "peaceful coexistence" themes were developed as means to seek cooperation with the Western democracies. During the late 1930's, Russian policy had led her to enter into peaceful coexistence arrangements with both sides of the approaching war.

Stalin's Strategic Concept for Peaceful Coexistence

Less than a year before his death, in an article in the September 15, 1952, issue of Pravda, entitled "Economic Problems of Socialism in Soviet Russia," Stalin, following in Lenin's steps, bequeathed the basic strategic direction for the skillful use of the "peaceful coexistence" campaign which was soon to blossom forth. Peaceful coexistence was to be employed as a psychological instrument of Soviet foreign policy so as to:

1. Prevent the premature outbreak of the decisive war against the Western World; i.e., before the Soviet Union was completely prepared, so as to avoid an irreparable defeat.
2. Win sufficient time behind the banner of "peaceful coexistence" so that the Soviet Union could accumulate its strength, multiply the production

1. The first step is to identify the problem or question that needs to be answered. This involves understanding the context and the specific requirements of the task.

the Committee's report, the Committee has been able to identify a number of areas where the Government has been successful in its efforts to improve the situation. The Committee has also identified a number of areas where the Government has been unsuccessful in its efforts to improve the situation. The Committee has also identified a number of areas where the Government has been successful in its efforts to improve the situation. The Committee has also identified a number of areas where the Government has been unsuccessful in its efforts to improve the situation.

It is noted that a year before his death, he had written in the September 15, 1951, issue of Psychiatry, entitled "Psychiatric Treatment of Schizophrenia in Soviet Russia," that, following Lenin's death, he had written the book "Schizophrenia in the Soviet Union" for the staff of the "General Hospital," Moscow, which was then in Moscow. The book was written in 1948-49 and was published in 1951.

of atomic weapons, and advance from an inferior position to a superior one.

3. Dampen the morale of the democratic countries, slow down their rearmament, and weaken their war potential.
4. Carry out, behind the call for peace, political infiltration throughout the free world, and by using neutralists and selfish peoples who want peace at any price sabotage the democratic world from within and place it entirely on the defensive.
5. Divide the democracies by the peace offensive and, above all, isolate the United States from its allies.

Despite his posthumous public degradation, Stalin's strategic legacy remains as valid, subject to Khrushchev's variation on Clausewitz's statement that "war is the continuation of policy by other means." If peace, in dialectic terms, is therefore a struggle, it differs from war not by its objectives, but by the means used. Peace, then, is the absence of military hostilities and nothing more. It is within this frame of reference that current Russian interpretation of peaceful coexistence is fixed. It is precisely this formulation which lends psychological operations their great utility in pursuing the Stalinist strategy.

The Soviet Disarmament Campaign

The really exquisite degree of policy integration, however, becomes strikingly apparent when the Soviet disarmament campaign is examined for the psychological implications and ramifications of this Kremlin policy.

Soviet national security objectives direct major effort toward the neutralization and removal of American power from Eurasia and eventual elimination of any form of military threat from the Western Hemisphere. These national security goals can be combined in proposals for disarmament, the guiding principle of which is: for the USSR, invulnerability; for the United States, paralysis.¹¹

The individual goals of this Soviet policy include the following:¹²

1. The paralysis of American will to use strategic nuclear weapons and, if possible, the elimination of all American and other Western nuclear weapons, both strategic and tactical.
2. The weakening or disintegration of the American alliance system, especially NATO.

¹¹J. M. Mackintosh, Strategy and Tactics of Soviet Foreign Policy (London: Oxford University Press, 1962), p. 238.

¹²John W. Spanier and Joseph L. Moger, The Politics of Disarmament (New York: Frederick A. Praeger, 1962), pp. 36-44.

There is a growing realization that the only way to achieve a lasting peace in the Middle East is through a negotiated settlement. The recent developments in the region have shown that a unilateral approach is not sufficient. The international community must continue to support the efforts of the parties involved to reach a comprehensive agreement. The peace process is a complex one, but it is essential for the stability and prosperity of the entire region.

1. The first step in the process of identifying and eliminating the causes of the problem is to determine the scope of the problem. This involves identifying the areas of the organization that are affected by the problem and the extent of the problem. This can be done by conducting a thorough review of the organization's operations and identifying the areas that are most affected by the problem.

1. The language of American life is the language of the American people, and it is the language of the American people that we must understand if we are to understand the American people.

3. The identification of Soviet policies with the aspirations and aims of the neutral nations recently liberated from Western Colonialism. Psychological warfare has served as a principal vehicle for the pursuit of those goals. It has been, from the beginning, a campaign designed to place the USSR in a favorable position, to appeal to the different segments of world public opinion--the Communist bloc, the Western World, and the uncommitted or neutral nations.

The tactical approach has been to attempt to create a worldwide revolution against nuclear weapons and to prompt peoples and governments all over the world to exert pressure on the American Government to forestall a possible resort to these arms in crisis. The end sought is to force the leadership elite to become unsure of their own capabilities, intentions, rights, and, above all, of their chances of success. This is to be accomplished by the neutralization of allies and by paralyzing principal sources of support, thereby causing the national leaders to vacillate.

By maneuvering American spokesmen into admitting that nuclear weapons are indeed terrible, the USSR has been able to place the United States in the paradoxical position whereby, on the one hand, her military power depends almost exclusively on nuclear weapons, while, on the other, her own representatives have stigmatized the

34. The identification of social policies with the

equilibrium and also of the national system

has been a constant theme of the American

historians. The American system has always been a political

system. It has been the product of the American people. It has

been the result of the American people's choice. It has

been the result of the American people's choice. It has

been the result of the American people's choice. It has

been the result of the American people's choice. It has

been the result of the American people's choice. It has

been the result of the American people's choice. It has

been the result of the American people's choice. It has

been the result of the American people's choice. It has

been the result of the American people's choice. It has

been the result of the American people's choice. It has

been the result of the American people's choice. It has

been the result of the American people's choice. It has

been the result of the American people's choice. It has

been the result of the American people's choice. It has

been the result of the American people's choice. It has

been the result of the American people's choice. It has

been the result of the American people's choice. It has

been the result of the American people's choice. It has

been the result of the American people's choice. It has

been the result of the American people's choice. It has

been the result of the American people's choice. It has

very strategy on which the United States and her allies rely for their security.¹³

Thus the focus of global concern is disassociated from crises inspired or exploited by the communists and fixed upon the purported immorality of the employment of nuclear weapons, the danger of a nuclear holocaust, and American "atomic aggression."

Classic Bolshevik doctrine holds that communists cannot fight an unjust war, even if they initiate it, since wars fought by communism are, by definition, progressive and revolutionary, the qualifications for "just" war. Khrushchev carefully maintained the distinction between just and unjust wars, thereby retaining war as a permissible instrument of revolutionary change so long as it serves the interests of communism and so long as conditions are suitable for waging it. The Soviet disarmament campaign has represented a major attempt to keep the path to world revolution open to all means of struggle, including whatever use of military force may be necessary, to reach the Soviet goal of global supremacy.

Associated psychological threads weave through all of these programs with the common psychological goals of total paralysis of Western will and debilitation of Western military, economic, and political power. Call it peaceful

¹³Ibid., pp. 38-39.

coexistence, disarmament, world peace--the ultimate inter-related and integrated goals are identical.

IV. A COMPARISON OF SOVIET AND UNITED STATES EFFORTS

A comparison of the organizations existing within the Soviet Union and the United States designed for the conduct of the psychological operations of psychological warfare is a discouraging exercise. It is difficult to compare such dissimilar operations. However, certain relative factors do emerge which demarcate areas of American weakness; these are as follows:

- I. A. The Soviet Union is completely organized for the waging of total, full-scale, psychological warfare during peace time and has been so for over thirty years.
- B. The United States has barely started its organizational development and has no policy guidance body specifically designated with the responsibility of insuring the development of an integrated, psychological program.
- II. A. Soviet psychological operations are uniform and centrally directed in accordance with the integrated plans of the communist party. The control of these activities is absolute,

coexisting, although, with some of the other factors-
related and laboratory tests are indicated.

It is found that a combination of water and

other factors is required.

A comparison of the various methods relating to the

water factor and the other factors assigned for the control

of the psychological treatment of psychological patients is a

disappointing result. It is difficult to compare with the

similar conditions, however, certain relative factors are

among them factors such as human resources, their use

as follows:

1. The water factor is completely neglected for

the study of water, soil-water, psychology-

and water factor factor factor factor factor factor

to the very little extent.

2. The water factor has been largely ignored in

psychological treatment and has no value

in the body experimentally compared with

the responsibility of therapy and therapy-

and of an integrated, psychological process.

3. The water factor is neglected in the study

and control of the human factor in the human factor

and integrated plan of the human factor.

The control of these activities is indicated.

is at a very high point in the Party, and is the responsibility of a separate department within the Executive Staff of the Party Secretariat.

B. American psychological warfare is only partially uniform. It tends heavily towards information activities conducted by the USIA. There is no central guidance or control; instead, there is a somewhat informal coordination with little compulsion, other than an individual's devotion to duty, to insure that policies, plans, and public announcements are compatible.

III. A. The Soviet Union has waged psychological warfare for forty-six years and has developed advanced organizational and operational techniques. The strategy is a total program, integrating military force, diplomacy, economic activity, and psychological operations into a detailed interlocking plan of action.

B. The United States waged psychological war for the first time in World War I. It carried out extensive operations in World War II and the Korean War. After each of the first

two conflicts, the organizations were hastily disbanded and no scientific, scholarly examination of the lessons to be learned was conducted. Consequently, no effective organization has been developed. The USIA under the guidance of Edward R. Murrow, evolved into a first-class information operation, but lacks the proper psychological matrix to be truly effective as a tool for psychological operations. There is no total United States program: foreign policy is still carried out largely through individual, as opposed to the collective, efforts pursued along the parochial lines of action of the various components of foreign policy.

- IV. A. The communist apparatus for psychological war is aggressive and is on the constant offensive--thus giving the USSR a psychological superiority.
- B. United States psychological operations, having no clearly-defined place in the conduct of national strategy and not stridently on the offensive, are forced or, in the eyes of

Two conditions, the organizational and the scientific, are necessary and sufficient for the development of the theory of the state. The organizational condition is the existence of a state apparatus, and the scientific condition is the existence of a scientific theory of the state.

The first major task was to establish a common framework for the analysis of the data. This was done by developing a set of criteria which would allow the comparison of the results from different studies. The second major task was to collect and analyze the data. This was done by reviewing the literature and conducting experiments. The third major task was to synthesize the results and draw conclusions. This was done by comparing the results from different studies and identifying trends.

the World, appear to be forced continually into a defensive position.

V. A. The Soviet program fights for the "liberation" of the suppressed and underprivileged. The program is repeated with an uncompromising insistence.

B. The United States has tended to be out of touch with the miseries and aspirations of the masses in the foreign countries, particularly those of the Middle East and Southeast Asia. As a result, the "pitch" has been too high and complicated--appealing to the spirit instead of the flesh. These tendencies began to diminish under Murrow's directorship of the USIA. Commercial means of mass communications retain the Madison Avenue-Hollywood approach. United States psychological efforts are certainly not insistent.

VI. A. Communist propaganda is spread by the largest propaganda organization in the world. Diplomats, trained underground organs, and the Communist Party sell the ideas of the propaganda war.

B. The United States has no single propaganda/

psychological warfare organization and no "psychological troops" to give unanimity to the utterances of the program, such as it may be.

VII. The people of the United States are generally ignorant or ill informed of the interrelationship between communism and the foreign policy of the Soviet Union. They are equally out of touch with their own heritage and national foreign policy. This has bred an apathy and aimlessness that, through the elected leaders, tends to blur the policy formulation process. In turn, a less than incisive and decisive foreign policy has become the hallmark of United States international relations.

However, before one becomes too despondent over these less than fatal frailties of the American nation, it should be remembered that:

. . . the United States remains the largest extant revolutionary experiment in the world--the first immense human community which survives without profound dogma or profound hatred and which attempts to make short-range, practical, and warm hearted (though ideologically superficial) concurrence the foundation for a political and industrial civilization. If the United States . . . [can survive the cold war] it may be that the rest of mankind will be persuaded that our kind of practicality is not only humanly preferable, but scientifically more defensible than the philosophies of competing civilizations.¹⁴

¹⁴Linebarger, op. cit., p. 296.

psychological factors organization and in
"psychological factors" as give meaning to
the structure of the program, such as is

any day.

VII. The people of the United States are generally
ignorant or ill informed of the international-
and foreign policy and the foreign policy
of the United States. They are easily out of
touch with their own history and national for-
eign policy. This has led to a policy and im-
balance that, however the elected leaders,
tends to make the policy transmission process.
In fact, a fact that initiative and decision fac-
tory policy has become the hallmark of United
States international relations.

However, before one becomes too despondent over these
less than ideal attitudes of the American people, it should
be remembered that:

... the United States remains the largest world econ-
omy and the largest in the world—the first industrial
power economy which evolved without external forces
or profound direct and indirect influences to make short-
range, gradual, and more rapid (though ideologically
unpredictable) economic development. It is the United States
and industrial revolution. It is the United States
that survive the cold war. It may be that the rest of
the world will be persuaded that our kind of technology
is not only superior, but essentially good
because it has the technology to conquer civil-
ization.

CHAPTER VI

A PROPOSAL

I. INTRODUCTION

Many distinguished minds have been directed at the solution to the difficulties encountered in organizing for the conduct of psychological operations. Simultaneously, there has been a curious reluctance to undertake the tasks necessary to the attainment of the objectives of the organizations created. It is the conclusion of this paper that the access route to the development of total strategies, which are, after all, well thought out, integrated plans of action to achieve the goals of American foreign policy, lies through organization and the assumption of the responsibilities of leadership.

Familiarity with a weapon or tool comes only with the employment and use of the instrument. It does not come from philosophic, detached observations. This is not to imply lack of regard for the role of scholarly research; but operational experience derives fundamentally from operating. Scholarship and research can provide theory and tentative doctrine. Its worth is no greater than the practical use to which this theory and doctrine are, or can, be put. The clarity with which the theory and doctrine can be stated and refined requires an operational input. Operational

Chapter VI

A. INTRODUCTION

1. INTRODUCTION

Many distinguished minds have been directed at the solution of the difficulties encountered in reaching the concept of psychological operations. Consequently, there has been a certain reluctance to present the results necessary for the attainment of the objectives of the current systems system. It is the conclusion of this report that the success of the development of total strategies, which are, after all, well thought out, integrated plans of action to achieve the goals of American foreign policy, lies through organization and the acceptance of the responsibility of leadership.

Working with a system as that shown only with the equipment and use of the instrument. It does not come from philosophy, external observation. This is not to imply lack of regard for the role of scientific research, but operational experience has been fundamentally from decision. Scholarship and research can provide theory and method. The world is as great as the physical and the social. This theory and method have to be put into effect. The theory and method can be stated and related to the theory and method. Operational input, operational

requirements should dictate the doctrinal requirements, not vice versa.

It has been developed that in the United States there is neither a clearly-articulated nor a widely-accepted concept of the nature of the psychological instrument of foreign policy. This follows from the Jackson Committee's valid observation that the psychological aspect of policy is not separable from policy and that the psychological implication in every act does not have life apart from the act. The American pragmatic approach yearns for a clear-cut doctrine, a check-off list of "do's" and "don't's." Consequently there is a frustration that derives from attempting to define a function the nature of which is dependent upon the operational requirements of unforeseen contingencies. In vernacular terms, it leaves one with the problem of trying to explain to a person, blind from birth, how purple might taste; in other words, "you simply can't get there from here." One can write around this vicious circle of cause and effect, discoursing upon the innumerable variations on the basic theme, indefinitely. This much is clear, however; so long as the United States awaits the birth of a clear-cut articulation of the role of the psychological instrument before it attempts to utilize the instrument, the understanding needed to articulate the role will never be born. The governmental machinery is "hung on dead center"

regulations should include the following requirements; not

also also.

It has been suggested that in the United States there

is neither a clearly-defined nor a widely-accepted con-

cept of the nature of the psychological instrument of for-

sign policy. This follows from the Jackson Commission's

valid observation that the psychological aspect of policy is

not separable from policy and that the psychological insti-

tution in every act does not have life apart from the act.

The American psychological approach seems to be a rather con-

crete, a check-out list of "do's" and "don't's." Com-

munity there is a conviction that behavior is determined

so that a function can be said of which it depends upon

the operational requirements of individual circumstances.

In psychological terms, it seems one with the problem of

trying to explain to a person, blind from birth, how people

might behave in other words, "you simply can't get there

from here." One can only expect that people will be

caused and effect, depending upon the immediate variations

on the basic mass, indefinitely. This view is clear, non-

over, so long as the world itself is the first of a

direct-out relationship to the role of the psychological in-

strument nature is attempts to utilize the instrument, the

understanding needed to articulate the form will never be

found. The government's activity is "up on the wall."

and will remain this way until an operational start is made.

Action and only action will break the circle and dispel the

fuzzy notion . . . [that psychological operations are limited to] a contest between two gladiators with the "minds of men" at stake . . . [accomplished through a process of] providing information or of cracking the Iron Curtain with a battering ram of truth.¹

To organize the tools of foreign policy so as to provide an integrated strategy requires machinery for the resolution of conflicting department viewpoints and positions. Policy, once formulated, requires methods of evaluation to insure that it is being carried out. In effect, this demands a policing of the departments of government in order to assure the executive leadership that progress toward the policy objective is being made in the way the leadership wants it made. There can be no place for unresolved positions on important national issues simply because the resolution will tread on the toes of one department or another.

II. AMERICAN ORGANIZATIONAL EFFORTS

Since 1941, several distinct organizational approaches to the solution of the problem have been employed. Under Roosevelt, the solution was to proliferate agencies and to

¹Robert T. Holt and Robert W. van de Velde, Strategic Psychological Operations and American Foreign Policy (Chicago: The University of Chicago Press, 1960), pp. 234-237, passim.

and will remain with you until we have completed the work
and again we shall see you in the future and again we

From 1961 to 1963, the Government of India, through the Ministry of Health, provided technical assistance to the Government of the Republic of India, through the Ministry of Health, to develop a system of health care for the people of India. This assistance was provided in the form of technical advice, training, and the provision of medical supplies and equipment. The Government of India also provided financial assistance to the Government of the Republic of India, through the Ministry of Health, to develop a system of health care for the people of India. This assistance was provided in the form of grants and loans. ... ..
... ..

1. The following information was obtained from the records of the Department of the Interior, Bureau of Land Management, regarding the acquisition of the land described in the preceding paragraph:

Chicago, the University of Chicago Press, 1961, pp. 134-135.

layer successive committees, offices, and bureaus, one upon the other. The administrative maze that resulted was breathtaking. The almost total elimination of the psychological program following World War II had its bright side, for, at least, it wiped from the governmental complex a truly monstrous, almost grotesque arrangement.

Shortly after World War II, the second conception began to appear in the early State-War-Navy Coordinating Committee (SWNCC). The pattern developed through a variety of larval stages and eventually appeared within the Department of State structure as the Interdepartmental Psychological Operations Coordinating Committee.

The path of development then passed through the Psychological Strategy Board (PSB) which was created by Executive Order in 1951. The PSB was to be responsible for the

formulation and promulgation, as guidance to the departments and agencies responsible for psychological operations, of over-all national psychological objectives, policies and programs, and for the coordination and evaluation of the national psychological effort.²

It was established outside the National Security Council structure but reported to the NSC on its activities and its

²United States Congress, Senate, Committee on Government Operations, "National Policy Machinery in the Soviet Union," Organizing for National Security, Volume 2 (Washington: Government Printing Office, 1961), p. 439.

evaluation of national psychological operations including implementation of approved objectives, policies, and programs by the departments and agencies concerned. The PSB failed, primarily, because it was founded upon the basic misconception that psychological operations existed apart from official policies and actions and could be dealt with independently by experts in this field.

The last and most refined stage was reached in the establishment, by another Executive Order, of the Operations Coordinating Board. The OCB was, at first, outside the structure of the National Security Council and was not incorporated within the NSC structure for another four years. Following his election, President Kennedy eliminated the Board, thereby, at least temporarily, ending this direction of organizational development.

All of the bodies that were developed in this second approach to the problem suffered from a common, fatal flaw. They attempted to coordinate, to conciliate, to synchronize a total program out of the individual programs of the member activities. None of these bodies could direct or impose a solution. All of them were heeded only, if, as, and when it suited the member activities to act in effective concert. The decision to act in concert was retained on the agency or departmental level. No organization can function properly if presumptuous juniors are permitted to decide whether or

evaluation of various psychological operations including
 implementation of approved objectives, policies, and pro-
 cedures by the departments and agencies concerned. The
 results, however, are not limited upon the basis
 of acceptance of the psychological operations conducted
 from official policies and actions and could be made with
 independently by experts in this field.

The last and most serious error was reached in the
 establishment of a central executive body, or the operations
 coordinating body. The G-2 was, at first, outside the
 structure of the National Security Council and was not
 connected with the NSC process for another four years.
 Following his election, President Kennedy eliminated the
 NSC, thereby, at least temporarily, ending this division
 of organizational development.

All of the bodies that were developed in this period
 applied to the process rather than a system, that is,
 they attempted to coordinate, to centralize, to synthesize
 a total system out of the individual components of the system
 separately. None of these bodies could direct or manage a
 program. All of them were created only, it is, and when it
 failed the system activities is not in effective control.
 The system is not in control and is not in control of the system
 departmental level. The organization has become greatly
 ill-organized, but it has continued to exist without it.

not they will carry out the letter and spirit of the policies of the chief executive. This observation remains as valid today as it was when Napoleon expounded it. A chief executive who permits the establishment of such an organization and subsequently does not correct any proclivities to parochialism is culpably responsible for the inevitable failure of the organization.

The third approach is really no approach at all. It was manifest by the Kennedy Administration's tendency to form policy out of small intimate meetings. This is the ad hoc method which may work satisfactorily in periods of comparative calm. The Cuban crisis produced food for some disturbing thought as to the degree of adaptability of the Kennedy approach to a multiple, high intensity, high risk crisis situation. The intellectual resources of the Government were totally committed during the October 1962 crisis; it is difficult to perceive how a similar or several similar crises could have been handled simultaneously. An effective organization for the employment of the tools of foreign policy must be able to serve in peace, "cold" war, or "hot" war without any major structural adjustments. The government must go on; it cannot pause in mid stride, drop everything else it is doing, and deal with the crisis of the moment. To operate and organize for such a method of problem solving is to invite grave danger.

and they will keep out the labor and profits of the public-
 edge of the chief executive. This management remains in
 will keep as it has been before. It is chief
 executive and people are established as such an organization-
 plan and organizationally have not changed and possibly in
 personnel is mainly responsible for the business
 failure of the organization.
 The third approach is really no approach at all. It
 was rejected by the Kennedy Administration's committee in
 form policy out of their business methods. This is the only
 one method which was most certainly in violation of
 competitive rule. The Cuban crisis provided food for some
 thinking enough to see the danger of stability in the
 Kennedy approach to a solution, after Kennedy, with risk
 crisis situation. The international character of the Cuban
 crisis was totally contained during the October 1962 crisis.
 It is difficult to perceive how a situation beyond crisis
 crisis could have been handled successfully. In effective
 organization for the management of the crisis in foreign
 policy was in this to serve in peace, crisis was, in 1962,
 we without any major international adjustment. The process
 was more so and it cannot leave in its stride, they every-
 thing else is in order, and deal with the crisis in the
 economic. The system and organization for such a world of peace-
 has nothing in its future grave danger.

III. THE POTENTIAL OF THE OPERATIONS COORDINATING BOARD

The first and third patterns are considered to be very poor and to offer little security if pursued. But the second approach still offers much promise provided it is corrected so as to function viably. The Operations Coordinating Board could have performed as it was intended to perform had it:

1. Been able to direct the members to develop long-range and integrated plans under the policy guidance of the National Security Council.
2. Been able to direct the members to carry out the plans and policy as formulated.
3. Not been allowed to develop away from its original concept. Its official inclusion within the National Security Council Structure in 1957 was bound to result in its performing less of its designed function and more as a NSC staff arm. This is precisely what occurred.
4. Been endowed with sufficient status to deal, at least, on an equal level with the operating agencies and departments. Access to the President, the Cabinet, and the National Security Council must not only be possible, but it must be easy as well. Under the existing conditions

The first and third paragraphs are considered to be very good and to offer little security if removed. But the second paragraph still offers some promise provided it is reworded so as to function clearly. The Specialist Committee would have been requested as it was intended to

1. There shall be three members to be elected by the
League and interested parties within the policy
guidelines of the National Security Council.
2. There shall be three members to be elected by the
League and interested parties within the policy
guidelines of the National Security Council.

1. Not been allowed to receive any form of religious
 worship. The official language spoken was
 National Security Council (NSC) in 1955 was
 found to exist in the following form of the
 National Security Council and was in a state of
 this is currently was known.

4. Some interest was expressed in the fact that, as
indicated, we are equal level with the agencies
operating and performing. However, in the event
they, the Chinese, and the national industry
would not only be possible, but it would
be very well. Under the existing conditions

of overlap and multiplicity of responsibility and authority, an agency attempting to develop long-range, integrated plans simply will not be able to conduct effective operations if it is on a lower level of importance than the Department of State or the Defense Department.

IV. CORRECTIVE MEASURES

Status of the Agency Head

Were such a body, as heretofore outlined, to exist, the position of its head within the government hierarchy would be of vital importance. He should attend all meetings of the Cabinet and all National Security Council meetings. He should be at no lower organizational level than that of a Cabinet member. These requirements stem from the following consideration:

First, he must be sufficiently high in rank to speak on equal terms with the department heads of the government. If his organization is to be effective, he must participate, as an equal, in the highest staff levels of policy formulation where his views on the susceptibility of emerging policy to integration into a coordinated planning system could be voiced positively and authoritatively. Since he would be directly concerned with the psychological implications of integrated plans formulated for the achievement of

of making the Ministry of Responsibility
and Ministry, as Agency attempting to making
impunity, integrated since they will not be
able to conduct effective operations if it is
at a lower level of importance than the Agency
and of course on the National level.

IV. CONSTITUTIONAL PROVISIONS

Terms of the Agency Head

There must be a body, as mentioned earlier, to make
the position of the head within the government hierarchy
would be of vital importance. The second person will be the
of the Cabinet and all National Security Council members.
He should be at a lower organizational level than that of a
Cabinet member. These provisions stem from the following

Considerations

First, he must be sufficiently high in rank to speak
on equal terms with the department heads of the government.
It is important to be able to do this, he must be able to
as an equal, in the highest state of mind of policy making.
Then when his views on the responsibility of making
policy to be implemented with a responsible planning system
could be voiced positively and substantively. This is
would be directly concerned with the operational policies
which is important since discussed for the development of

policy goals, he should inject directly into the policy formulation process a feeling for the important psychological implications which would be expressed much later in those psychological operations developed as part of an integrated national planning process in support of policy. Had such a high level of advice been available, it is possible that decisions which led to such sources of long-term political discomfort as the recognition of Israel, the refusal to fund the Aswan Dam, and the Sky-Bolt might have been viewed in a different manner. Therefore, his position would be untenable if he must participate as a guest or a junior member in any of the policy process.

A second consideration is that his contribution must be made expeditiously so that it may have its impact before policy is formulated. To consult with, or to be consulted by, a Cabinet member or a member of a Cabinet member's staff, out of the context of the actual discussion and after the fact is unsatisfactory. Policy formulation as well as planning for policy execution must be integrated. In many cases, there will be no time or opportunity for altering decisions or changing the course of policy action taken by the President and his principal advisers after they have determined what the decisions and courses should be.

There is one government official whose position within the executive hierarchy vests him with the stature

policy goals, we should submit directly into the policy
 formation process a finding that the important psychological
 and legislative issues would be represented with later in
 those psychological questions developed in part of an inter-
 related national planning process in support of policy. And
 such a high level of review has been available, it is possible
 that decisions which led to such reviews of long-term
 political decisions as the reorganization of Israel, the
 transfer of the Jewish people, and the 1948-1949 might have
 been viewed in a different manner. Moreover, his position
 would be remarkable if he were perceived as a guest or a
 junior member in any of the policy process.

— A second consideration is that his contribution must
 be made explicitly so that it may have its impact before
 policy is formulated. To consult with, or to be consulted
 by, a Cabinet member or a member of a Cabinet member's staff,
 out of the context of the actual discussion and after the
 fact is unnecessary. Policy formulation as well as imple-
 menting the policy decision must be integrated, in many cases,
 there will be no time or opportunity for separate decisions
 or changes in the course of policy action taken by the govern-
 ment and the legislative branch after they have determined
 what the decisions and actions should be.

— There is one government official whose position
 within the executive hierarchy seems to be the best

necessary for such a post: the Vice President of the United States. His post already exists; he is ranked only by the President himself; and he possesses a direct route of communication to the President which is unsurpassed. His direct participation in this foreign policy process would also serve the Country in the most advantageous manner with respect to preparing the Vice President for the full responsibility of the Presidency should he be called upon to succeed to this post.

Agency Location and Authority

An agency such as has been implied might well be established within the Executive Offices of the President and titled the "President's Planning Board." It would have its function stated in the Executive Order establishing its existence as follows:³

The National Security Council having recommended a national security policy and the President having approved it, the Planning Board shall: (1) whenever the President shall hereafter so direct, establish, develop, and formulate with the participation of the

³The statement of function for the OCB serves as an excellent basis for this proposed "President's Planning Board." The original, from section 2 of the Executive Order establishing the OCB, appears on page 455 of U.S. Congress, Senate, Organizing for National Security, op. cit. The OCB, even to its last days exhibited so many possibilities, had it not been "still-born," so to speak, and had it been allowed to develop and not permitted to fall prey to staff absorption within the NSC that it offers a natural basis for an organizational solution.

agencies concerned (a) detailed operational planning responsibilities respecting such policy, (b) the integration of the interdepartmental aspects of the detailed operational plans developed by the agencies to carry out such policy, (c) a timely and integrated schedule for execution of such plans, and (d) national plans in such a manner as to exploit the full psychological aspects and implications of the nation's national security policy. (2) initiate new proposals in response to opportunity and changes in the situation. The Board shall from time to time make reports to the National Security Council with respect to the implementation of this order.

The Board thus would start life invested with the Presidential mandate to act, to formulate coordinated policy, and to direct the constituent agencies to carry out the plans developed. It would face the agencies with the necessity to consider individually and collectively the psychological implications throughout the total program.

Membership and Organization

The membership and organization of the President's Planning Board would include the following:

The Director

The Director of the President's Planning Board would be the Vice President of the United States. The Director would participate in all National Security Council and Cabinet meetings and preside at all meetings of the Planning Board.

The Planning Board

The Planning Board would be composed of the following officials:

agencies concerned (a) detailed operational planning responsibilities respecting such policy, (b) the integration of the interrelated aspects of the detailed operational plans developed by the agencies to carry out such policy, (c) a timely and integrated schedule for execution of such plans, and (d) national plans in such a manner as to provide the full system logical aspects and implications of the nation's national security policy. (2) In addition, the program is designed to provide for cooperation in the future. The Board shall from time to time make reports to the National Security Council with respect to the implementation of this policy.

The Board shall report to the President with the

President's message to Congress, to formulate coordinated policy,

and to direct the Government agencies in carrying out the

plans developed. It would have the agencies and the means

with to consider individually and collectively the program

logical implications throughout the total program.

Recommendations and Organization

The membership and organization of the President's

Planning Board would include the following:

The Director

The Director of the President's Planning Board

would be the Vice President of the United States.

The Director would participate in all National

Security Council and Cabinet meetings and provide at

all meetings of the Planning Board.

The Planning Board

The Planning Board would be composed of the

following officials:

1. The Under Secretary of State for Political Affairs.
2. The Deputy Secretary of Defense.
3. The Director of the USIA.
4. The Director of the U.S. Arms Control and Disarmament Agency.
5. The Director of the Central Intelligence Agency.
6. The Special Assistant to the President for National Security Affairs.

The Planning Board Working Groups⁴

These groups would be composed of responsible operating officials from the agencies concerned with policy implementation. The chairman of each group would be representative of the Planning Board staff, and his deputy would be the group member from the agency which had chief responsibility. Each group would include a member from the Bureau of the Budget. The functions of these working groups would be two fold: (1) to provide a standing mechanism at the working level for the development of integrated actions to implement national security policies and

⁴Patterned after the OCB working groups. In this case, however, Chairmanship devolves upon a Staff member of the Planning Board, providing a tighter control than existed under the OCB system.

and his deputy would be the group member from the

agency which had chief responsibility. Each group

would submit a report from the Bureau of the subject.

The function of these working groups would be to

study (1) to provide a working mechanism at the

operating level for the development of integrated

action in planning, research, and policy making.

²It should be noted that the concept of the working groups, in this case, however, is fundamentally different from a staff agency of the planning board, providing a liaison between the various agencies and the planning board.

(2) to prepare operations plans and progress reports for consideration by the Planning Board.

The Planning Board Assistants⁵

A Board Assistant would be designated from each agency represented on the Planning Board. The membership would include a representative from the Bureau of the Budget. Duties would be to provide staff support for each Board Member; to assist him in interdepartmental as well as intradepartmental planning and negotiation on subjects dealt with by the Board; and to aid the respective agency's Working Group members in meeting the requirements laid down by the Planning Board. In order to meet his responsibilities, an official designated for duty as a Board Assistant would have to hold sufficient rank within his organization to give him direct access to the principal operating officials of his agency.

As a group, the Planning Board Assistants would meet weekly, under the Chairmanship of the Special Assistant to the Vice President for National Security Planning, to review papers prepared by the working groups in order to insure that the documents were

⁵ Patterned directly after the OCB Assistants or "Board Assistants" as they were commonly called.

all to provide against these and possible future
for consideration by the Planning Board.

The Planning Board's Response

A Board statement would be prepared from the
agency's response to the Planning Board. The
Board would receive a representative from the
Board at the meeting. The Board would be in a
staff report. The Board would be able to
information as well as information from
and the information on the Board's side by the
Board and on the Board's side by the
Board would be meeting the Board's side
by the Planning Board. It would be the Board's
information, as stated, that the Board
Board would have to be satisfied with
within his jurisdiction to give his Board
the Board's response to the Board.
As a result, the Board would be able

ready for Board action. It is at this point that most careful attention would be directed to the adequacy of a paper, the accurate reflection of any differences of view among the agencies, and the development of a proposed course of action for further consideration by the Board.

The Planning Board Staff⁶

The Planning Board staff would be composed of the following elements:

1. The Office of the Planning Board Staff
Director and the Deputy Director. The Special Assistant to the Vice President for National Security Planning would be the Director.
2. The Secretariat, which would be the source of executive secretaries for the working groups and would generally assist and provide substantive staff support for the process by which member agencies reached decisions and developed actions to carry out national security policies.
3. The Supervisory Staff which would be the source for all chairmen of the planning

⁶Patterned after the OCB Staff.

easy for Board action. It is at this point that
 and careful attention would be directed to the
 of a paper, the Board is called to
 difference as to how many and how often, and the
 of a proposed Board of Directors for the
 of the Board.

The Board of Directors

The Board of Directors would be composed of
 the following members:

1. The Office of the President of the Board.
2. The Secretary and the Treasurer.
3. The Board of Directors.
4. The Board of Directors.
5. The Board of Directors.
6. The Board of Directors.

Board Working Groups. The Deputy Director of the Planning Board Staff would assume direct responsibility for the operational guidance of this Staff element.

4. The Special Studies Staff which would provide the Special Assistant to the Vice President for National Security Planning and the Supervisory Staff with current background information on foreign political, military, economic, social, and ideological developments affecting the psychological aspects of implementation of national security policies.

The Executive Office of the Director

The Executive Office of the Director would include the Vice President's personal Planning Board Staff which would be headed by the Special Assistant to the Vice President for National Security Planning. It would also include an Office of Inspector General which would be competent to review and evaluate any and all aspects of the operations of Planning Board Agencies.

The Special Assistant to the Vice President for National Security Planning

The Special Assistant to the Vice President for

National Security Planning would be the Vice President's principal staff officer for national security affairs. He would be a person without departmental ties who, through a direct and close staff relationship with the Vice President, would be fully cognizant of the desires and the requirements of the Vice President. The Special Assistant would sit with the State Department Policy Planning Council. He would also sit with the Cold War Advisory Panel of the Department of Defense. He would act as the Executive and principal Staff Officer for the Planning Board, would be the director of the Planning Board Staff, and would chair the Planning Board Assistants.

In a further attempt to improve the quality of input to the Planning Board and the policy formulation process, the Director of the USIA would be designated a member of the Policy Planning Council of the Department of State. He would attend, as a guest, all Cabinet meetings and all National Security Council meetings. He would continue to be represented on the Cold War Advisory Panel of the Department of Defense.

Operational Evaluation

At this point, the concept of operational evaluation is worth a brief examination. Frankly, it is borrowed from

the idea of the General Accounting Office which acts as a form of independent follow-up and fiscal conscience for the departments and agencies of the Government. The resistance to enforced policy integration will extend downward in all the agencies. It is a peculiar bureaucratic phenomenon that the more junior the official, the more vested becomes the interest and operational patterns. In agencies as large as are those concerned with the formulation and execution of National Security Policy, the dragging of myriads of "little" feet can paralyze the production of total plans. The road to the little man's heart is through his efficiency report, and it would be the role of the Inspector General's staff to shed light on the degree of effective staff work within the agencies.

In the same manner that the Vice President would serve in a way no other official could as the eyes and ears of the President, so would the Inspector General serve the Vice President. The Inspector General would report directly to the Vice President on the results of a continuous series of surprise working inspections administered by his staff to the various headquarters and field offices of Board agencies. These reports would be the basis for improvements in a weak post or activity. The personnel assigned to this office should serve extended tours, on loan from the agencies comprising the Board. They must have demonstrated unquestioned

The idea of the General Accounting Office which acts as a
 form of independent follow-up and fiscal controls for the
 departments and agencies of the Government. The position
 for national policy integration will extend somewhat in all
 the agencies. It is a position of general supervision that
 the more precise the official, the more useful becomes the
 interest and operational interest. In agencies as large as
 one those concerned with the formulation and execution of
 national security policy, the degree of activity of "little"
 head can purchase the production of great things. The need
 in the little man's head is through the efficiency of
 and it would be the role of the Department of Defense's staff to
 shed light on the degree of efficiency which exists within the
 agencies.

In the same sense that the Vice President would
 serve in a way as other officials would in the eyes and ears
 of the President, so would the independent national staff
 Vice President. The Director General would report directly
 to the Vice President on the results of a continuous series
 of various working committees administered by his staff in
 the various departments and field offices at home and abroad.
 These reports would be the basis for recommendations in a
 form of activity. The personnel assigned to this office
 should have extensive knowledge on how the agencies are
 running the Government. They must have demonstrated capabilities

integrity, objective judgment, and marked ability in a variety of headquarters and field posts of the parent agency before consideration for assignment to the Planning Board Staff.

V. CONCLUSION

It is not intended to delve further into this organization. In the research and studies incident to the development and writing of this paper, a conspicuous lacuna in the American efforts to evolve an organization for the conduct of psychological warfare has been the marked failure to profit from past mistakes. There has been a reluctance to modify and to utilize anything of the past. New structures have been erected and discarded to be replaced by entirely different arrangements. Some of the proposals have been truly mammoth in concept and design, extending to the advocacy of an additional department of the Federal Government. While the American quest has been definitely along the organizational line, its philosophy seems to be that the answer can only lie in something predominantly new and untried.

There seems little doubt that the path is, indeed, an organizational route. However, organization can be expected to produce only a partial answer. President Truman kept a small sign on his White House Desk; it read: "The Buck

integrity, objective judgment, and sound ability in the variety of assignments and field work of the parent agency which consideration for assignment to the training board.

It is not intended to give further facts and figures. In the present and future limited to the development and working of this paper, a comparison between the various efforts to achieve an organization for the control of psychological warfare has been the main reason for the present work. There has been a realization of the need for a better organization of the work. The present work has been divided into two parts. The first part is devoted to the study of the various organizations. Some of the organizations have been fully worked in the past and have, according to the author, been of an additional department of the Federal Government. While the American government has been working along the organizational line, the British government seems to be the only one which has been working along the psychological line. The present work is devoted to the study of the various organizations. Some of the organizations have been fully worked in the past and have, according to the author, been of an additional department of the Federal Government. While the American government has been working along the organizational line, the British government seems to be the only one which has been working along the psychological line.

These results indicate that the only significant difference between the two groups was in the number of correct responses. The experimental group performed significantly better than the control group in the number of correct responses. This result is consistent with the hypothesis that the experimental group had a better understanding of the task than the control group.

Stops Here." The acceptance of the inescapable responsibility of leadership can never be avoided through some piece of organizational legerdemain. The unending series of organizational failures are silhouetted in the light of this reality.

It is submitted that the time is long past when we should look over our shoulder; survey where we have been; and divest ourselves of the American preoccupation with the organizational extravaganza.

The proposed solution makes but three claims to any originality. It attempts to employ an old, familiar framework which, if properly restructured, could function effectively. It focuses attention upon the responsibility of leadership and annunciates an unequivocal, positive guidance which demands, rather than requests, a specific performance from the governmental agencies. At all levels, direction and control are retained tightly, under the interlocking supervision of the Planning Board's permanent staff members. Finally, it is comparatively simple and attempts to profit from the more obvious lessons of the past. In the last analysis, however, the following words of Theodore Roosevelt articulate the riddle of national purpose which must be solved, at all levels of American government and society, if this Nation is to continue along its path of greatness:

If we stand idly by . . . if we shirk from hard contests where men must win at hazard of their lives and at risk of all they hold dear, then the bolder and stronger people will pass us by and will win for themselves the domination of the world.⁷

⁷Cited in United States Navy, Leadership Manual (Washington: Government Printing Office, 1963), p. 1.

It is again fairly by . . . it is still from hard com-
 plete words was not the heart of their liver and
 as that of all they said best, from the border and
 together with will said as we will with for them
 gives the connection of the world.

PLANNING FOR PSYCHOLOGICAL OPERATIONS
A PROPOSAL

A Research Paper

Presented To

The Research Department

Air Command and Staff College

In Partial Fulfillment of the Graduation Requirements of ACSC

by

Major Lee-Volker Cox

March 1997

REPORT DOCUMENTATION PAGE				Form Approved OMB No. 0704-0188	
Public reporting burden for this collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing this collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden to Department of Defense, Washington Headquarters Services, Directorate for Information Operations and Reports (0704-0188), 1215 Jefferson Davis Highway, Suite 1204, Arlington, VA 22202-4302. Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to any penalty for failing to comply with a collection of information if it does not display a currently valid OMB control number. PLEASE DO NOT RETURN YOUR FORM TO THE ABOVE ADDRESS.

13. SUPPLEMENTARY NOTES					
14. ABSTRACT It is incumbent upon the state to gain support for national objectives. Employment of instruments of power is designed to influence other nations and organizations to respond favorably. Therefore, impacting the decision making process is the underlying principle for IOP power projection and highlights the psychological element. During a period of declining resources and increased world competition, the United States must find new ways to reach out and promote American interests. In order to maximize the impact and exploit the influence events create, joint planning and interagency coordination of psychological operations are critical. The current ad hoc interagency coordination and joint planning process do not maximize the psychological factors? impact and fully exploit its asymmetrical influence on a target audience?s decision making process. Traditional views towards concepts, particularly military PSYOP, do not lead to the innovative solutions demanded by an environment of declining funds and resources. This study recognizes the multidimensional aspect of military PSYOP and calls for redefining an area of operations that has changed little over the years. Additionally, the establishment of an organization responsible for the development of a national marketing strategy integrating all IOPs to achieve objectives beyond the tactical level is advocated. Reviewing subject matter literature from the last forty years provided the project?s basis for concepts relating to PSYOP and the Soviet missile gap deception case study. Internet searches, interviews, and recent literature brought current issues to light and developed a picture of U.S. organizations involved in influencing target audiences.

Preface

The ancestor of every action is a thought.

—Ralph Waldo Emerson

Thoughts and ideas are the most powerful weapons on earth, for without them questions would be left unanswered and decisions not made. This project explores the tools that are available not only to the warfighter but all decision makers to influence others. The study was developed to: encourage discussion throughout the government and military, not just among those who are considered PSYOP specialists; and call for a reevaluation of how we, as a nation, influence others in pursuit of our objectives.

The impetus for this project was two-fold: professional and personal. First, the recognition that although the armed forces are undergoing their largest demobilization and infrastructure reduction since World War II, their ops tempo is at an all time high as they are increasingly called upon to participate in military operations other than war (MOOTW). In this environment of declining resources and increased taskings, it is imperative we leverage our capabilities to maximize their impact.

Second, I came to the realization that everything we do in the military is done to influence the actions of others. We may use our military instrument of power either as a stick to coerce and deter or as a carrot to entice. Regardless of how or why it is employed, its objective remains constant: to influence others to take actions favorable to American interests.

The following pages argue for the redefining of military PSYOP as it is traditionally understood and the establishment of an organization that guides and integrates its multidimensionality with the psychological impact of other instruments of power into a coordinated national PSYOP effort. The framework begins in chapter one with the development of terminology and systems to introduce the reader to key concepts. Chapter two provides an overview of U.S. organizations involved in influencing target audiences, followed by the Soviet strategic missile gap deception case study in chapter three. The final two chapters integrate concepts and identify the need to redefine PSYOP and the potential role it has in grand strategy.

It would have been impossible to complete this project without the help and efforts of many people. I wish to thank Major Ralph Millsap of Air Command and Staff College for providing me with endless leads for information, loaning support material from his personal library and sponsoring this project as my faculty research advisor. My gratitude goes to President George Bush for responding to my written questions and for sending interview and speech transcripts. Colonel Frank Goldstein of Air War College also deserves my appreciation for our discussions and access to his collection of subject matter materials, as well as Dr. Richard Muller, Lieutenant Colonel Andrew Weaver and Major George Weil for their interviews. Many thanks to Phillip Lacombe, with whom I have had numerous stimulating discussions dealing with image and perception projection over the years. My parents were also instrumental in instilling in me the understanding that actions do speak louder than words and what we do influences others. Finally, for my wife Michelle, many thanks for not only her understanding and support, but also her help as a research assistant.

This project explores issues that are not commonly accepted and proposes ideas that go beyond the traditional understanding of PSYOP. It is designed to challenge you to “think outside the box.” PSYOP offers you, the warfighter, another tool to leverage U.S. capabilities and exploit the cascading effects of influencing the decision making process. As we head into the 21st century, we need all the tools we can get!

Abstract

It is incumbent upon the state to gain support for national objectives. Employment of instruments of power is designed to influence other nations and organizations to respond favorably. Therefore, impacting the decision making process is the underlying principle for IOP power projection and highlights the psychological element. During a period of declining resources and increased world competition, the United States must find new ways to reach out and promote American interests. In order to maximize the impact and exploit the influence events create, joint planning and interagency coordination of psychological operations are critical.

The current ad hoc interagency coordination and joint planning process do not maximize the psychological factors' impact and fully exploit its asymmetrical influence on a target audience's decision making process. Traditional views towards concepts, particularly military PSYOP, do not lead to the innovative solutions demanded by an environment of declining funds and resources. This study recognizes the multidimensional aspect of military PSYOP and calls for redefining an area of operations that has changed little over the years. Additionally, the establishment of an organization responsible for the development of a national marketing strategy integrating all IOPs to achieve objectives beyond the tactical level is advocated.

Reviewing subject matter literature from the last forty years provided the project's basis for concepts relating to PSYOP and the Soviet missile gap deception case study.

Internet searches, interviews, and recent literature brought current issues to light and developed a picture of U.S. organizations involved in influencing target audiences.

Chapter 1

Introduction

To fight and conquer in all battles is not supreme excellence; supreme excellence consists in breaking the enemy's resistance without fighting.

—Sun Tzu
The Art of War

Conflict is a part of life born from the desire for change. Inherent in change are two opposing forces, one empowered by the status quo and the other driven by the aspiration for a new order. As Sun Tzu recognized 2500 years ago, victory need not be gained on the battlefield. Rather, victory is determined by the side which exerts the greatest influence over the other's decisions and actions, thereby inserting a psychological dimension into conflict. A state has at its disposal instruments of power (IOPs) that provide it with a broad range of options to influence events. When employed in concert, the synergistic effect of diplomatic, economic, military, and information initiatives enhances the state's ability to impact a target audience's decision making process. Since there is a psychological dimension to each IOP, their integration ensures a unity of effort among all participating organizations and maximizes their influence.

Recently, decision makers have placed an ever increasing demand for military IOP options short of the traditional mission of winning the nation's wars. The current national military strategy directs numerous military operations other than war (MOOTW) to "help

shape the evolving world environment,” an objective that is not unique to the military.¹ This emphasis places importance on exploiting the military’s psychological impact beyond the tactical battlefield level, a prime candidate for military PSYOP but an area of planning that has not received the emphasis warranted by its potential results. Traditional military PSYOP conducted by military personnel emphasizes tactical, battlefield operations. To maximize the military’s impact, people both inside and outside the defense establishment must go beyond this limited understanding and accept a new multidimensional military PSYOP incorporating both military and non-military efforts. A multidimensional PSYOP that embraces all activities conducted by the military to influence not only military events but also economic and political decisions *and* other IOP initiatives designed to influence decisions that impact the military. Only after recognizing the potential influencing power of the military and its synergistic psychological impact when coordinated with other IOPs, can a successful integrated national PSYOP strategy maximize its impact on a target audience’s decision making process.²

The author proposes that the national strategy planning process lacks sufficient oversight and fails to effectively coordinate the psychological dimension of all the nation’s IOPs into an integrated PSYOP strategy. Furthermore, a new understanding of military PSYOP and its inherent multidimensionality is critical for the establishment of a national PSYOP strategy.

Terminology

A wide variety of concerns mold relationships and can be divided into two categories. Those one has control over and those one does not.³ The environment in which these

relationships exist drives the establishment of national objectives and interests. For instance, the American belief of Manifest Destiny resulted in the Louisiana and Oregon Territory purchases and a war with Mexico. While more recently, the North American Free Trade Agreement was signed to bolster America's economy, an objective outlined in President Clinton's National Security Strategy of Enlargement and Engagement.

The key to influencing a state's behavior and benefiting the sender's objectives is shaping the state's environment, such that decision makers perceive it is in their best interest to take actions favorable in relation to the sender. Therefore, the ability to influence another nation's decisions is based on the perceptions of events as it relates to that states' objectives. This does not imply that the one attempting to influence has complete control over events that shape the target state's environment. However, the power to influence is grounded in manipulating perceptions (perception management) and therefore the psychological element. The accuracy of those perceptions is irrelevant. Their value is not what can or can not occur, but what others believe will occur. It can be said then that the ability to psychologically impact a target audience and favorably influence its decisions serves as the cornerstone of a state's ability to project power.⁴

Today's easy accessibility of information is driving an increasingly interdependent world. Methods of employing IOPs to influence target audiences and the size of those audiences are both growing. As William Bundy recognizes, "Real power—the ability to affect others—seems in fact more widely dispersed than at any other time in world history."⁵ An increasing number of leaders and decision makers throughout the government now recognize the importance of coordinating efforts to influence both foreign and domestic audiences. As a result of this heightened interest in influencing

others, policy letters, directives, and other publications are calling for an increased emphasis on projecting the right image to the right audience at the right time to achieve greater success for U.S. initiatives. All of these developments point to the need to better understand the psychological factors that impact the decision making process.⁶

Elements of PSYOP Development

The recognition of the need to coordinate efforts has led to a plethora of concepts and terms relating to PSYOP ranging from the benign sounding marketing and public diplomacy to what many view as anti-democratic tactics such as deception and black propaganda. Theorists, authors, and practitioners have redefined and modified PSYOP terminology to the point that definitions and concepts applicable to this paper must be reviewed prior to further discussion of the topic.

Psychological operations take place throughout the tactical, operational, and strategic environments. The contributions of military PSYOP at the tactical level, supporting a commander during conflict by employing loudspeakers, radio and television transmissions, leaflets, and other locally focused activities, have proven to be effective in combat, most recently Desert Storm. Tactical activities have for the most part gained acceptance and become embedded in the planning process. This paper focuses its efforts on the less understood and accepted strategic and operational PSYOP.

Operational PSYOP is regionally focused. In terms of military efforts, operational military PSYOP involves regionally oriented efforts prior to, during, and after conflict in support of a commander's plans. The final grand strategy level category is strategic, which involves all activities conducted by the government to "influence foreign attitudes,

perceptions, and behavior in favor of U.S. goals and objectives.”⁷ The Reagan Administration actively pursued strategic PSYOP. However, they also integrated domestic audiences, creating what this paper uses as public diplomacy efforts.⁸

Once the level, strategic, operational, or tactical, of the PSYOP initiative is established, then its purpose, basis, and type must be determined. The PBT model in figure one integrates these three elements (purpose, basis, type) of PSYOP to create a representation of the wide range of activities available to the planner. The purpose for PSYOP activities can be either, coercive, deterrent, or incentive, and is directly related to the desired response.

Figure 1. PSYOP Purpose-Basis-Type (PBT) Model⁹

For instance, as the U.S. projects power, it can influence another government’s decision to reverse course, maintain the status quo, or choose a favorable option from several courses of action (COA). A review of the literature reveals a significant disagreement of the uniqueness of coercive and deterrent activities, and very little discussion on incentive PSYOP. For this paper, coercive activities include efforts to convince a government to *reverse* previous decisions and positions. This may involve the threat of force, sanctions, or the removal of special benefits. Deterrence implies the *prevention* of a given course of action, that may or may not have been the state’s most

beneficial option. Finally, incentive initiatives are designed to influence a state to *choose* a given option that furthers U.S. interests. Incentives may include security assurances, favored nation status, exchange programs, or nation assistance to name just a few.

A second element of PSYOP is the initiative's factual basis and can be categorized as either white, gray, or black. White activities are based on fact. Black PSYOP ignores the facts and is made-up of lies and fabrications. Gray activities fall between the two extremes and are neither completely true nor false, but may be considered exaggerations and half-truths. Surprisingly, a large amount of the literature is dedicated to the discussion of propaganda in these terms, but none could be found deriving similar identifiers for PSYOP activities in general. However, discussions concerning propaganda assign a second attribute to the concepts, that of what organization is credited with the product, resulting in a restrictive two-dimensional model.¹⁰ The final element of PSYOP addresses this issue.

The third piece of the puzzle involves the type of activities, overt or covert. In the former, the sponsoring state is open and attaches its credibility to events, while the latter is characterized by clandestine operations. Figure one serves as a model to illustrate the multidimensionality of PSYOP initiatives and the relationships between its three elements. For instance during the Cold War, U.S. efforts to prevent a Soviet nuclear attack were deterrent in nature. The deterrence was based on a real retaliatory capability (white) and communicated to the world through public statements and demonstrations (overt). Therefore, this can be identified as a deterrent-white-overt PSYOP effort.

Western societies are comfortable with this type of campaign and view activities in the non-white covert realm as inappropriate. On the other hand, maskirovka (deception

tactics) was embedded in the former Soviet Union's power projection efforts. The missile gap deception, discussed in chapter three, serves as an outstanding example of their ability to incorporate multidimensional PSYOP in pursuit of strategic objectives. One of the deception's objectives was to drive a wedge between the Western alliance (coercive). To accomplish this, their deception campaign involved a public campaign of threats (overt) based upon exaggerated capabilities claims (gray). Although their overall efforts may be categorized as coercive-gray-overt, they integrated efforts spanning the entire range of PSYOP from coercive to incentive, white to black, and overt to covert, in attempts to achieve strategic objectives.¹¹

The previous discussions are not inclusive of all the issues relating to PSYOP. However, they serve as the background required for understanding the basis of this paper.

Influencing the Target Audience

To better understand how the U.S. influences certain actions or positions of other states, the process leading up to their decision for a given action must be examined. In *U.S. Naval Institute Proceedings*, John Petersen identifies ideas and perceptions as the keys to influencing decision makers in a rapidly changing world environment.

We have new sets of global problems that discount traditional, narrowly focused national interests. We are finding that the notion of using brute force to coerce behavior change is crude and inefficient, and eventually adds to our problems. We are coming to understand that the nurturing of systems requires new mind-sets and new tools...we appear to be changing our forces from hardware to ideas and perceptions. The fact that there are few things more powerful than ideas for changing someone's behavior only lends fuel to the trend.¹²

Petersen recognizes ideas must be communicated in such a way that the receiver perceives the desired message and then acts upon it favorably in relation to the sender's

objectives. In order to influence decisions, it is critical that PSYOP practitioners understand how to link their objectives with a target audience's actions. The Action-Influence Model (AIM) serves as a framework to do just that. What follows is an overview of key AIM concepts. An in-depth discussion of the model's four phases and an example are located at appendix D, figures 10-15.

The basis for AIM is an understanding of how a sender creates observable phenomena that influence a target audience's decision making process, resulting in actions favorable to the sender. The message flow process, pictured in appendix A, figure four, provides a general framework for the more detailed components of AIM. Forming desired phenomena to support a given interest is the task of the message sender.¹³ The sender must carefully select the medium(s) that will most likely result in the desired phenomena, thereby impacting the final decision. By no means is it inferred that the sender has control over all factors involved in both creating and the resultant perception of the phenomena. Although the message process requires a great deal of planning throughout, it is impossible to overcome all of the fog and friction existing within the environment and interactions between humans. However, selecting the proper target audience is a critical link in the process, for if the wrong people are influenced, then the targeted decision making process will not be impacted.¹⁴

Clausewitz identifies a trinity of the government, people, and military; within each state that is fundamental for its continued existence. All three interact and influence each other in different ways depending on the situation. The understanding of their relationship is imperative, if one is to develop a plan to influence a given segment of society. For as Clausewitz suggests,

A theory that ignores any one of them and seeks to fix an arbitrary relationship between them would conflict with reality to such an extent that for this reason alone it would be totally useless.¹⁵

Figure five, appendix B, demonstrates the relationships between these groups and figure six recognizes the overlap of membership among groups. Within each of the groups, there are various levels incorporating people with greater stature or importance as displayed in appendix C, figure eight. Phenomena may be perceived at any level and then communicated throughout the group or across to one of the other segments (appendix C, figure nine). Regardless of the type of society—democratic, autocratic, monarchy—these relationships do exist to one extent or another. Their impact of cross-influencing other segments may rely on the type of society, but ultimately any one of the three can make decisions or serve as the primary advocate for change.¹⁶ The segment of society that is most influential and the most likely to be impacted in regard to a desired outcome becomes the target audience.

Once the target audience is selected, it becomes the task of the PSYOP specialist to determine the best methods to influence them, taking into consideration contextual and operational variables such as culture, attitudes, motives, social class, religion, organization, and mediums of message transmission.¹⁷ Integrating and expanding these concepts result in AIM.

During the analysis phase (appendix D, figure 11) the sender identifies an objective that is not being achieved and establishes a target audience that is in a position to beneficially influence decisions. As part of the projection phase, seen in figure 12, events are tailored to influence the target audience's decision making process. The medium employed to create a phenomena that transmits the message may aim to coerce, deter, or

entice and can range from actual military force to the media. Col. John Boyd's OODA (observation-orientation-decision-action) loop serves as the basis for the third phase.¹⁸ The internalization phase, in figure 13, begins with the observable phenomena, which may be altered by uncontrollable factors (fog and friction) before it is filtered by the target audience's perceptions. Additional groups, including domestic and secondary audiences, also observe the event and impact either the target audience or message sender. Inputs to the target audience are evaluated and influence a decision to take an action that either moves towards or away from the desired outcome or has no change. As part of the feedback phase, figure 14, the sender evaluates the message's success with the new outcome and inputs from other audiences, resulting in a new objective or further attempts to meet current interests.¹⁹

Notes

¹ National Military Strategy of the United States, *A Strategy of Flexible and Selective Engagement*, (Washington D.C.: Government Printing Office, 1995), i. Although this particular quote is from the executive summary, the overall strategy identifies peacetime engagement and deterrence and conflict prevention as primary tasks facilitated by overseas presence and power projection. All of these are MOOTW activities aimed at impacting the perceptions and therefore decision making process of other nations, peoples, or groups.

² Frank R. Barnett and Carnes Lord, eds., *Political Warfare and Psychological Operations* (Washington D.C.: National Defense University Press Publications, 1989), xi.

³ The Air Force's Air Command and Staff College discusses the importance of considering a wide range of factors during the development of a military initiative in the campaign planning model (see below). Although the campaign planning model is primarily taught as a tool for the development of military action, its basic concepts can be applied to PSYOP initiatives. Beginning with the appropriate end state that will satisfy strategic objectives. Strategic objectives are translated into military objectives. In order to achieve the military objectives, enemy centers of gravity must be identified. These centers of gravity assist in the development of possible COAs, resulting in a final plan. Throughout the process, the campaign planning model identifies the concerns that help shape the environment as "operational art" and "contextual elements." Operational art components are factors that the sender has some control over (more over their own than the target audience's) and include: logistics, technology, information, deception, and targeting

Notes

science to name a few. Contextual elements are factors that the sender has little control over other than to possibly exploit the relationships they develop. Several contextual elements are: political, cultural, economic, and leadership.

Chapter 2

Current U.S. Policy

The attainment of the carpenter is that his work is not warped, that the joints are not misaligned, and that the work is truly planed so that it meets well and is not merely finished in sections.

—Miyamoto Musashi
A Book of Five Rings

The U.S. has a formidable array of organizations and methods at its disposal to increase the acceptance of American policies and objectives. Given the right circumstances, anyone involved with the government, from the President, congressmen, military leaders, to staffers, may play a role in transmitting messages to target audiences and impacting perceptions at the strategic and operational level.¹ During remarks in Detroit, President Clinton identified the need to concentrate and coordinate efforts to “shape” the world.

We must set our sights on a more distant horizon. Through our size, our strength, our relative wealth, and also through the power of our example, America has a unique ability to shape a world of greater security and prosperity, peace and freedom. These are long-term efforts and often they take place behind the headlines. But only by pursuing them can we give our children the best possible opportunity to realize their own God-given potential.²

Integrating Instruments of Power

Perhaps no one better understood the synergistic effect of those efforts than President Reagan, as evidenced throughout his National Security Decision Directives (NSDD). He recognized the interdependent relationship of the economic, military, and political/diplomatic IOPs and identified information as a fourth source of power projection.³ “U.S. Relations with the U.S.S.R.,” NSDD 75, exemplifies President Reagan’s IOP coordination efforts. (NSDD 75 can be found at appendix F.) This directive was designed to “focus on shaping the environment in which Soviet decisions are made both in a wide variety of functional and geopolitical arenas and in the U.S.-Soviet bilateral relationship.”⁴ The strategy involved a multidimensional PSYOP approach targeting the Soviet leadership, military, and population by impacting their economy, allies, and relationship with third world and Western states. In order to implement his strategies, President Reagan established the Special Planning Group (SPG), which was inactivated after he left office, under the National Security Council.⁵

Recent events in Bosnia provide another example of the U.S. actively pursuing its interests. In this instance, regional stability can be identified as the primary objective. American diplomatic leadership played a major role in establishing U.N. resolutions calling for the end of hostilities and the acceptance of the General Framework Agreement (Dayton Peace Accords). In order to gain international and domestic U.S. support for military intervention, an intensive information campaign was executed. Finally, only those parties abiding by the accords are eligible for American economic assistance. Although diplomatic, economic, informational, and military initiatives had a synergistic effect on the warring factions, there was little effort to coordinate them, further leveraging their impact.

Since there is a psychological dimension to each IOP, failing to integrate them prevents a unity of effort among all participating organizations and suboptimizes their influence.⁶ Recognizing PSYOP's inherent multidimensionality and the necessity to leverage declining resources, failure to collectively implement IOPs due to poor interagency coordination is not a luxury the U.S. can afford.

Interagency Relations

Implementing broad strategies to support the National Security Strategy (NSS) or specific programs and initiatives directed by the President or Congress requires cooperation among departments, agencies, and commissions. Unfortunately, the interagency process to integrate efforts maximizing PSYOP impact is ad hoc, leading Frank Barnett to characterize it as the most “neglected” component of the NSS.⁷ Although the Department of State is recognized as the “lead U.S. foreign affairs agency,” it is but one of the many organizations involved in projecting American interests.⁸ In order to understand the scope of U.S. efforts, following are several of the agencies and their missions. The Peace Corps utilizes volunteers working for world peace and mutual understanding, and helps to establish the U.S. as a good neighbor by supporting regional stability. The Environmental Protection Agency is dedicated to preserving the world's ecosystems while supporting the educated use of renewable resources. Businesses look towards the Department of Commerce to promote international trade and the Federal Communications Commission to regulate international communications. Official information relating to the Central Intelligence Agency's “special activities” is scarce but most likely falls into the covert, black, and gray arenas.⁹

The Secretary of State has general foreign policy guidance over two extremely influential agencies: the U.S. Information Agency and the U.S. Agency for International Development.¹⁰ One of the most powerful components of public diplomacy, USIA is chartered to influence foreign publics through numerous programs ranging from Voice of America to cultural exchanges. Its companion organization, USAID, promotes American interests via development and humanitarian assistance.¹¹ Neither agency is regularly invited to participate in NSC foreign policy discussions.

The two primary players in the forefront of U.S. efforts to influence foreign activities are the Department of State and Department of Defense. Former Secretary of State Warren Christopher described their complementing capabilities.

In today's world, when American interests are more global than ever, our national security requires the wise use of force and diplomacy together. Diplomacy that is not backed by the credible threat of force can be hollow, ultimately dangerous. But if we do not use diplomacy to promote our vital interests, we will surely find ourselves defending them on the battlefield. Today, in more places and circumstances than ever before we must get the balance right.¹²

More than one scholar has identified this relationship as political-military warfare or political war waged against other states. Recognizing that their methods are unique but their objectives shared and complementary, the interaction between both departments is worth exploring.

The Secretaries of State and Defense participate in the National Security Council and grand strategy development. Their relationship, however, does not involve close, coordinated global or regional program development unless directed by the President. Within the State Department, most issues are addressed as bilateral relationships between the U.S. and a second country by the Under Secretary for Political Affairs Group.

Geographic bureaus, with dissimilar alignment from geographic combatant commanders, coordinate regional initiatives. It is the U.S. Ambassador and his country team that develop programs, in conjunction with the geographic CINC, targeting a country. This under secretariat is also responsible for managing U.S. participation in multilateral peacekeeping and developing support for U.S. policies in the United Nations.¹³

The Bureau of Political-Military Affairs, as part of the Under Secretary for Arms Control and International Security Affairs Group, is the remaining State Department organization with significant military related responsibilities. Arms control negotiations, weapons of mass destruction (WMD), foreign security assistance and arms sales are several of the bureau's worldwide defense issues.¹⁴

A case can be made that DOD's counterpart to the Secretary for Arms Control and International Security is the Under Secretary of Defense (Policy). The USD(P) is, among other matters, responsible for political-military policy issues, security assistance programs, WMD and arms control issues. The assistant secretary of defense, responsible for special operations and low-intensity conflict including civil affairs and PSYOP, falls under the USD(P).¹⁵ Due to the time-consuming bureaucracy and ad hoc relationships, the primary interaction between DOD and DoS is at the lower levels. Although both the CINC and Ambassador are official representatives for the U.S. government, there is no formal process to coordinate programs. The CINC's staff and Ambassador's country team are responsible for developing integrated plans in an ad hoc environment.¹⁶

To help guide the CINC, joint doctrine recognizes the vital role PSYOP plays across the range of military operations from MOOTW to war and identifies lofty objectives for its employment.¹⁷ Special operations forces (SOF) from the Army, Navy, Air Force, and

Marine Corps provide DOD PSYOP capabilities. However, the vast majority of their resources are product-oriented and support the dissemination of information through the use of radio and TV broadcasts and printed material distribution. A review of the SOF 1996 posture statement reveals PSYOP is a special forces mission “involving planned operation to convey selected information” to influence foreign audiences. Although this mission, in conjunction with joint doctrine’s role of PSYOP, implies a large latitude of operations for PSYOP, an overview of actual uses by combatant CINCs reveals a narrow focus of information dissemination via media products in support of foreign international defense, humanitarian assistance, and commanders during actual conflict. In fact, according to the posture statement, the functional combatant commanders are not involved with SOF PSYOP programs.¹⁸ The lack of understanding and appreciation for the multidimensionality of military PSYOP has resulted in little doctrinal or methodology changes since World War II and a continued focus on the tactical level. With an inadequate understanding of PSYOP and poor interagency coordination, then it comes as no surprise that the U.S. lacks an integrated national PSYOP strategy.

Chapter 3

The Soviet Missile Gap Deception

We always seek to direct the development of events, so as to ensure that while defending the interests of the socialist camp, we do not provide the imperialist provocateurs with a chance to unleash a new world war.

—Nikita Khrushchev

Sometimes drive a wedge between a sovereign and his ministers; on other occasions separate his allies from him. Make them mutually suspicious so that they drift apart. Then you can plot against him.

—Chang Yu
The Art of War

Public diplomacy initiatives require a great deal of coordination and the equivalent of interagency cooperation. The Soviet leadership was perhaps the most skilled in integrating all their efforts to influence decisions throughout the world and attain their objectives. This chapter summarizes the Soviet “missile gap” deception, successful for almost five years. Appendix E provides greater detail and analysis.

America awoke 27 August 1957 to the *Washington Post* headline “Red ‘World Missile’ Fired ‘Huge Distance,’ Russians Announce.”¹ It was the start of a well-conceived Soviet psychological campaign designed to subvert the Western alliance and promote global communism while deterring the use of strategic threats by the U.S.² To better understand the events that ensued, one must examine the foundation that set the stage.

Setting the Stage

The Soviets recognized their limited ability to directly impact U.S. policies and actions. They could, on the other hand, greatly influence world opinion, particularly in Western Europe and the Middle East, due to their proximity and ability to project military power. The Soviets quickly exploited potential pawns as states unknowingly became surrogates by pressing for changes in U.S. positions that benefited the communist bloc.

Premier Khrushchev's confidence in his ability "to direct the development of world events" stemmed from his conviction that the U.S. would not initiate an unprovoked attack against the Soviet Union or interfere with activities inside the communist bloc. This belief was created by American responses to four events. First, the U.S. had possessed the capability to destroy the Soviet Union after World War II and failed to take aggressive actions. Next, the rapid acceptance of détente at the 1955 Geneva Summit demonstrated the West's willingness to cooperate with only minor Soviet concessions. Third, the original success of the Soviet strategic bomber deception indicated the ease in which the U.S. willingly accepted exaggerations. Finally, America's failure to provide military assistance to the Hungarian people during the recent revolt exposed a trepidation by the West to become involved in situations that were considered within the accepted Soviet sphere of influence. Khrushchev keenly understood that as long as U.S. interests were not directly threatened, he could take the lead and influence world events.³ Former CIA director Allen Dulles acknowledged after the missile gap drama played out, he believed the Soviets understood the magnified psychological impact of ICBM advances and space achievements before the West did.⁴

The combination of these factors led the Soviets to develop a program designed to increase U.S. and Western uncertainty about the strategic balance. Arnold Horelick and Myron Rush identify the Soviet inducement of Clausewitz's fog and friction into the U.S.-U.S.S.R. relationship as:

1. Soviet leaders assert they possess capabilities;
2. Soviet leaders make threats that presuppose such capability;
3. Soviet leaders demonstrate capabilities or similar capabilities to induce others to credit the USSR with capability;
4. Soviet leaders take actions that imply capabilities exist.⁵

The following events during the missile gap deception follow this general pattern of interweaving military and space achievements, the creation of world crises, arms control, media campaigns, threats, and half-truths.

The Deception Unfolds

The seeds for the missile gap deception were sown during the 1956 Suez Crisis as the USSR maneuvered to take advantage of the situation. Statements released by the Soviets implied the use of rockets against Great Britain and France unless they agreed to an immediate cease-fire with Egypt. Both countries stopped hostilities the next day, not because of Soviet demands, rather due to continuing U.S. opposition. However, Soviet timing led to a public perception that France and Great Britain had backed down, boosting Soviet prestige, especially in Egypt and throughout the Middle East. For the next year, similar well-timed demands, threatening the use of rockets, targeted Western activities.⁶ Then on 27 August 1957 *The Washington Post* reported that TASS had announced the successful test of a "super, long-distance intercontinental multistage ballistic rocket" that "flew at a very high, unprecedented altitude covering a huge distance." Included in the

announcement was the re-release of a story discussing successful Soviet high altitude atomic tests. According to TASS, the Soviets were “impelled to take all necessary measures with the object of safeguarding” their security.⁷ Radio Moscow echoed the assertions, reporting advances only “offset the Western countries in the development of atomic and hydrogen weapons.”⁸ None of the announcements stated the missile’s accuracy or if the technology to put a nuclear warhead on board existed.

Western response echoed Senator Henry M. Jackson’s comments on the Senate floor.

It would be hazardous for the United States to dismiss the ICBM claim as propaganda...It would be a disastrous blow to our people and our allies should the Soviets win this race, because it would represent the first time the United States has failed to win a race involving an important weapon system.⁹

Two days later, Valerian Zorin, the Soviet’s chief arms control negotiator terminated talks due to what was categorized as western intransigence. The Soviets had repeated their willingness to renounce all military uses of atomic weapons, but according to Zorin the U.S. refused to accept this offer, forcing the Soviets to develop their new missile. On Friday, 30 August 1957, TASS accused Western and in particular U.S. media for developing a “war hysteria” around the missile.¹⁰ Several days later, *Newsweek* accurately predicted this was the start of a campaign to “make a mockery of the U.S. (nuclear) shield.”¹¹

The announcement and withdrawal took place about one week before the U.N. General Assembly session on the Hungarian revolt. The Soviets were working to change their image from a ruthless occupying force to a “peace-loving (people) who have the ultimate terror weapon but offers to forfeit its advantage for the sake of peace.”¹² For the

next few weeks, TASS reports discussed characteristics and capabilities of ICBMs, never claiming Russia had actually tested one with these traits.¹³

Figure 2. Development of Soviet ICBM impacts arms control negotiations¹⁴

Less than two months after the ICBM announcement, Sputnik I was launched and the entire world heard a signal from outer space. The Soviets had proven their mastery of rocket technology. In an interview with *The New York Times*, Khrushchev said, "We now have all the rockets we need: long-range rockets, intermediate range rockets, and short range rockets," explicitly announcing they had all the types of missiles needed and implying they also possessed a sufficient quantity. Over the next few years Soviet statements and actions intensified, specifically targeting West Germany, Great Britain, Turkey, Japan, and others, as Khrushchev worked to gain credibility for his ICBM force and its threat to Western Europe.¹⁵

The Berlin Crisis in 1959 raised concerns that the Soviets truly had a formidable ICBM force. For nothing else had changed in east-west relations, except the possible Soviet missile capability, that would explain the new hard-line position.¹⁶ In a meeting with New York Governor Averell Harriman, Khrushchev said, "If you send in tanks (to

Berlin) they will burn and make no mistake about it. If you want war, you can have it, but remember it will be your war. Our rockets will fly automatically.”¹⁷ The cumulative effects of Berlin, Sputnik, missile rattling, and a growing uncertainty over U.S. nuclear security assurances began to impact global perceptions. By early 1960 USIA reported,

...current views of relative US-USSR power has shifted sharply since the advent of the first Sputnik and the development of intercontinental missile capabilities...In the critical areas of military strength and space achievements and a rate of economic growth capable of supporting them at a high level, popular opinion believes...the U.S. to be inferior to the USSR.¹⁸

Figure three illustrates the decline of U.S. military prestige and the Soviet Union’s corresponding ascension from November 1957 to February 1960. The Soviet’s enjoyed a nearly 3:1 public opinion margin in Great Britain, France, West Germany, and Norway. A further analysis of the report identifies the sources of change in opinion were the synergistic result of successful multidimensional PSYOP efforts targeting Western perceptions.

Figure 3. Perceptions of Relative U.S./USSR Military Strength¹⁹

1. Soviet space achievements were equated with military capabilities.
2. Recently expanded international presence exerted influence and leverage in areas where little or no impact had been the status quo.
3. New “confident tone and aggressive posture” assumed a position of strength. Soviet achievements and Western reactions supported this assumption.

4. Official U.S. concern of Soviet military power and technological achievements.
5. Small, focused Soviet foreign economic programs targeted high impact/visibility situations supported Soviet claims of growing economy and military power.
6. Doubts of Western alliance preparedness to meet Soviet challenges.²⁰

As Western European anxieties brought into question whether they could “unconditionally (depend) upon the protection of America’s atomic shield in the event of limited conflict,” U.S. estimates of Soviet capabilities were rapidly changing.²¹ Secretary McNamara called these downward revisions “substantial.” Between January and February, estimates of Soviet ICBMs fell 66 percent. Within 18 months, their ICBM strength was less than four percent of original expectations.²² Finally, in 1964, DoD admitted the Soviets only had a handful of operational ICBMs.

For almost five years, the Soviets’ “double deception” of the size of their ICBM force and willingness to use it drove world relations. They recognized that if a nuclear war started it would be on their terms and they would have to instigate the first critical actions to threaten vital American interests.²³ Therefore, while the U.S. moved forward spending enormous sums on rapid development of three different systems, the Soviets built a force just large enough for show but saved resources for future ICBM generations.²⁴ In 1963, Allan Dulles, CIA director during the deception, wrote in his book *The Craft of Intelligence*: The question was,

. . . would they use their bulky and somewhat awkward ‘first generation’ ICBM, effective though it was, as the missile to deploy, or would they wait for a second or third generation? Were they in such a hurry to capitalize on a moment of possible missile superiority that they would sacrifice this to a more orderly program?²⁵

He acknowledged Khrushchev led a remarkable psychological campaign of statements, indicators, and events that gave the impression the Soviets were rapidly

moving forward with early ICBM deployment. Although many of the Soviet gains during the missile gap deception were short lived, others had lasting impacts. Its effects demonstrated the leveraging of a multidimensional PSYOP campaign integrating IOPs to ensure a national unity of effort in pursuit of strategic objectives.

Notes

¹ This rocket was later identified as the SS-6 Sapwood, primarily used as a space booster, very few became operational as strategic ICBMs. In order to overcome a lack of large rocket engine technology, the Sapwood utilized 32 smaller rocket engines. In essence, the Soviets used brute force to obtain an intercontinental range (6200 miles)..

Chapter 4

Reevaluating American PSYOP

The efforts of physical and psychological factors form an organic whole, which, unlike a metal alloy, is inseparable by chemical process . . . One might say that the physical seem little more than the wooden hilt, while the moral factors are the precious metal, the real weapon, the finely-honed blade.

—Carl von Clausewitz
On War

The Soviet missile gap deception was a successful PSYOP program. Their efforts influenced U.S. and Western decisions as supported by Secretary McNamara's comments after the ruse had been exposed.

This nation created a myth of its own weakness . . . the ending of the myth has made it possible to take a firm line with our adversaries and at the same time to reassure our friends that we are strong and determined to use our strength if we have to.¹

His comments imply U.S. positions on issues were softened, and allies' confidence in American security assurances was somewhat shaken. Both outcomes were desired objectives of the Soviet web of deception that involved coordinating space program advances, arms control initiatives, military tests, diplomacy, the impression of a peaceloving nation, official statements, international threats, and media reports into a well-conceived strategic PSYOP program. Soviet efforts of integrating IOPs highlights the multidimensionality of PSYOP campaigns and points towards a reevaluation of how

America influences other states. If, as the Soviets demonstrated, military activities impact non-military decisions and other IOPs may be used to influence military decisions, then the question arises, what role does the military have in the process? In other words, what is military PSYOP?

Redefining Military PSYOP

Joint military doctrine acknowledges the psychological dimension of military actions but draws a line between the influence events may exert on decisions and actual PSYOP. “Actions such as shows of force or limited strikes may have a psychological impact, but they are not PSYOP unless the primary purpose is to influence the emotions, motives, objective reasoning, or behavior of the targeted audience.”² Yet the only reason for a show of force or any other military activity is to send a message that the U.S. supports a given position and that anyone who opposes it better think twice.

Several recent examples illustrate the psychological dimension of military activities.

1. Libya. The 1986 Libyan Raid objectives, though not planned as PSYOP, coincided with three NSDDs targeting Libya and were designed to demonstrate the high cost of sponsoring terrorism.³ Muammar Qadhafi received the message loud and clear and since then has considerably reduced his terrorist actions against the U.S.⁴
2. Russia, Zaire, Bangladesh. American armed forces providing disaster relief or humanitarian assistance send a message to the world that America believes in alleviating human suffering and maintaining regional stability with a collateral message that the U.S. can deploy forces anywhere, anytime on short notice.
3. Pasadena. When millions of people around the world saw the B-2 fly over the Rose Bowl parade, the Air Force was putting global reach and global power on display, not entering a high-tech float.
4. Arms Control. U.S. support for the Comprehensive Test Ban Treaty is designed to prevent other states from joining the nuclear weapons club.
5. Military arms sales. Providing modern military equipment to Pakistan establishes a regional counterbalance to India.

None of these activities were planned as or even considered PSYOP, but the U.S. initiated them as attempts to influence a target audience and further American interests.

Thirty years after the missile gap deception, President George Bush and Saddam Hussein fought a battle for world opinion before coalition forces expelled Iraqi troops from Kuwait. With the strong backing of Saudi Arabia and several Western states, President Bush worked to develop a coalition force and world support. He painted Iraq's moves as a "ruthless assault" against all civilized nations and consolidated world opinion through U.N. resolutions, resulting in a formidable and overwhelming coalition force.⁵ International response was much simpler to gauge than the possible impact efforts had on Iraq and her allies. Without dependable intermediaries, neither President Bush nor then National Security Advisor Brent Scowcroft knew if their attempts to communicate with Hussein were reaching him.⁶ However, to insure the safety of coalition forces, President Bush felt it was critical to influence Hussein's decisions on the use of weapons of mass destruction. He accomplished this by increasing Hussein's uncertainty of America's willingness to use nuclear weapons.

...it (a nuclear response) would be extraordinarily difficult. I suppose you could conjure up some horrible scenario that would call for the use...but it was not something that we really contemplated at all. What we did want to do, though, was leave doubt.⁷

On the other side, Hussein was working to break up the coalition and render it an ineffective fighting force. He created an illusion of a much stronger Iraqi army that forced coalition partners to build a larger military force, requiring more time.⁸ The longer it took to prepare, the greater the likelihood Hussein could break the coalition. Two of his efforts aimed at influencing the coalition nearly succeeded. The first initiative designed to fan the

flames of anti-American sentiment and fracture the coalition involved a fabricated story reporting that Egyptian and Saudi forces were fighting American troops, who were desecrating Muslim holy sites. This resulted in Muslims rioting around the world against U.S. influences and the coalition. One series of riots threatened the Pakistani government. If the Pakistani government had fallen or given in to pressure and pulled out of the coalition, a domino effect among other Muslim nations might have occurred, jeopardizing the entire coalition.

A second coalition cracking effort targeted Israel. Through the use of Scuds aimed at cities, Hussein hoped to provoke a military response, drawing Israel into the conflict and tearing apart the coalition. Combine the fact that many of the rockets had dummy concrete warheads with their poor accuracy, it can be surmised he was targeting Jewish public opinion, not militarily significant facilities.⁹

The aforementioned events had one thing in common, the implicit or explicit attempt to influence a target audience's behavior in favor of the sender's objectives. In the latest Air Force Executive Guidance, "terrorism, sabotage, and unconventional warfare" are identified as tools available to future adversaries to influence U.S. national policy.¹⁰ These phenomena transcend traditional tactically oriented military PSYOP of radio, television and loudspeaker broadcasts and leaflets. However, the recognition of PSYOP contributions beyond special operations is increasing, especially as Information Warfare moves to the forefront of future operations.¹¹ The time is right to reevaluate what is considered PSYOP.

If one accepts the joint doctrine premise "the employment of any national power, particularly the military element, has always had a psychological dimension,"¹² then it is

not difficult to conclude that planners should take this dimension into consideration and plan to exploit its influence. For example, United States Strategic Command exists for the psychological dimension of influencing potential adversaries not to employ WMDs against the U.S. The first three words in its mission statement are to “deter military attack.”¹³ The command takes great pride and has a large public affairs staff to disseminate their message of deterrence, yet it does not have a PSYOP specialist.¹⁴ George Copley repudiates the currently mild reception perception management receives in the military.

A target audience, whether an enemy or friend, domestic or foreign, will always perceive *something* from the way in which a government or armed force postures itself, *and will act on that perception*. So, given that a perception will be made whether this is wanted or not, it should be seen as important to project the image in the way you wish it to be perceived.¹⁵
(emphasis by Copley)

PSYOP has the potential to be the most powerful weapon in the military’s arsenal. It targets the mind, influencing decision makers to take steps supportive of U.S. interests in peacetime and war and possibly preventing conflict. The military establishment must come to the recognition that PSYOP does not support activities; rather military initiatives are developed and executed to influence others and therefore support PSYOP. Multidimensional military PSYOP provides increased options to not only the commander in the field, but also the NCA. It includes activities involving or impacting, but not necessarily undertaken by, the military. For instance, successful efforts to break the coalition by Hussein would have had similar results to victorious Iraqi forces. The coalition would have been weaker, possibly deprived of essential Arab support. A similar analysis recognizing the inherent multidimensionality for the other three IOPs can be employed with identical results.

Therefore the author proposes that military PSYOP must be redefined to accept its multidimensionality. Activities conducted by the military to influence a broad range of decisions (not just military) and efforts employing other IOPs to influence military related decisions must be integrated into a new military PSYOP.

National Marketing Strategy

The Soviets repeatedly demonstrated the value of coordinated public diplomacy. Using the inherent indirect approach of PSYOP, they melded:

...symphonic orchestras and sports teams with military threats, technological breakthroughs with the propagation of the Marxist-Leninist myth....So complete (was) the amalgam of military strategy, diplomacy, ideological agitation, and cultural and scientific activities that no one can say where communist propaganda begins and where it ends.¹⁶

Integrating resources and activities to influence an audience are not new ideas in the West. However, it is better known as marketing, a more palpable term than PSYOP, perception management, or influence peddling. It is virtually impossible to escape marketing efforts aimed at influencing one's opinion. Advertisements on TV, radio, the Internet, billboards, and bumper stickers are designed to influence the consumer. Corporate healthcare, education, and incentive programs are instituted to influence employees to stay at their current jobs. Establishment of charitable organizations and recycling efforts promote the kinder, gentler side of a caring organization. These examples are not intended to be all inclusive or as absolutes but only scratch the surface of the programs developed to influence decisions and perceptions.

Business understands the need to incorporate objectives, vertically and horizontally throughout the organization, to maximize their impact on target audiences. Federal

organizations do take efforts to reach out to external audiences. The challenge strategists face is creating a coordinated program, similar to President Reagan's NSDD 75, integrating their activities and maximizing the possible synergistic effect. The U.S. would benefit from such a national marketing strategy for objectives, not unlike the global campaigns General Motors and IBM use.¹⁷

Events surrounding the recent Gulf War demonstrated the possible outcome resulting from a lack of IOP unity of effort. For the establishment of a counterbalance to Iranian hegemony in the Middle East, Western nations, including the U.S., provided Iraq with economic and military support, bolstering Hussein's regime and powerbase. Even as he turned the Iraqi military machine against Kuwait and amassed forces on their border, the U.S. diplomatic response to a possible invasion of Kuwait was ambivalent at best and tacit approval at worst. The lack of American military in the region exasperated the image of an uninterested U.S. These efforts influenced Hussein's decision to invade since it appeared American interests were not at stake. This perception could not have been further from the truth. Maintaining regional stability and access to oil reserves were then and still are vital U.S. interests.

Arguably integrating a stronger diplomatic position supporting Kuwaiti sovereignty, a show of military force and economic assistance to aid Iraq's recovery from its recent war with Iran may have deterred Hussein. Employing any one of these in isolation would most likely have had little or no effect. Strong diplomatic efforts denouncing a possible invasion without, as Warren Christopher said, a perceived willingness to support it with force could be dismissed. However, combined diplomatic and military efforts may only have served to illuminate shortcomings in Iraq's ability to execute the invasion, thereby

temporarily deterring him, but not reducing his hostile will. Economic and humanitarian programs would have been needed to complete an integrated multidimensional PSYOP program. In comparison to the expense of: rebuilding Kuwait and Iraq, prosecuting the war, and the lives lost, the above integrated preventive efforts may have been much more cost effective.

The author contends that the Soviets succeeded in developing a coordinated program because they had a strong centralized organization that focused efforts, a critical element the U.S. does not share. Although the President and NSC develop objectives and provide guidance to departments, agencies, and commissions, each organization determines what actions it believes are the most appropriate. Coordination is ad hoc at best, often omitting valuable players such as USIA.¹⁸ Decentralized planning and execution further exasperate the problem of developing common terminology and increases misunderstandings of intentions and capabilities.¹⁹ Therefore, the author proposes the establishment of an oversight organization, similar to President Reagan's NSDD 77 mandated special planning group, would be the first step in exploiting the synergistic effect of a national marketing strategy.

Chapter 5

Conclusions

Machines don't fight wars. Terrain doesn't fight wars. Humans fight wars. You must get into the mind of humans. That's where the battles are won.

—Col. John Boyd

In today's increasingly interdependent world, the ability of a state to exploit the psychological factor by creating phenomena that favorably influence the decision making process of target audiences continues to expand. Maximizing the impact of a state's tools of influence, its diplomatic, economic, informational, and military IOPs, requires a unity of effort integrating a wide range of agencies and activities into a well orchestrated campaign to support national objectives and interests. Not unlike the other IOPs, the military option can be employed in a broad range of activities, from humanitarian assistance to war, aimed at influencing the decision making process of a target audience. To fully leverage the military's resources and magnify its impact, people both inside and outside the defense establishment must go beyond the traditional acceptance of military PSYOP tactical tool and embrace its intrinsic multidimensionality. The author proposes that a new multidimensional military PSYOP must be accepted, one that expands the military's role to influence a broader range of decisions and incorporate other IOPs in efforts to impact military decisions. Accepting such a redefined PSYOP concept will increase the

effectiveness of America's armed forces, especially as MOOTW taskings increase. Through better understanding of military PSYOP and its inherent ability to influence political, military and economic events, planners can maximize the synergy of integrating it with other IOPs.

The foundation for better understanding PSYOP is embodied in the elements of its development and the four phases of AIM. The elements of PSYOP development involve three factors, purpose, basis, and type, interacting to produce a desired phenomena. The purpose of an activity may either be coercive, deterrent, or incentive, depending on if the desired outcome is a reversal of a target audience's decision, a prevention of the selection of a COA, or enticing a COA selection. A second element involves the informational basis of the initiative and may range from white (factual) to black (lies and fabrications). The final element describes the type of PSYOP efforts as overt at one end of the scale and covert at the other end. The integration of these three elements can be illustrated using the PBT model in figure one.

Incorporating the four interrelated phases of AIM—analysis, projection, internalization and feedback—are critical for successful PSYOP development. The phases guide a PSYOP practitioner in the creation of phenomena that will influence the target audience's decisions to a position favorable to the sender. Analysis serves as the foundation of any PSYOP campaign and includes the objective, desired outcome, target audience and message. Phase two involves projecting a desired message utilizing IOPs in the creation of an observable phenomena. Boyd's OODA loop serves as the basis for phase three, helping to explain the internalization process of observable phenomena and its resultant action. Finally, feedback is critical for a reevaluation the entire process.

The Soviets were masters of this process and recognized the synergistic effect that results from the strategic coordination of PSYOP with the psychological dimension of each IOP. Their successful missile gap deception serves as a testament to their ability to incorporate scientific and military achievements, arms control, threats, the media, economic aid and crises development into a focused effort to drive a wedge into the Western alliance and prevent hard-line U.S. positions. After the deception was uncovered, McNamara and Dulles acknowledged its influence on U.S. positions and policies, the transatlantic alliance, and the cost of efforts to close the gap.

In comparison, American PSYOP today is fragmented by an ad hoc interagency coordination process. Few understand its far reaching effects. There are many advocates of tactical PSYOP in the military. However, advocates for the strategic integration of PSYOP are hard to find. Although Joint Doctrine recognizes the inherent psychological element of military activities, it fails to accept these same activities as PSYOP unless they were planned as such. The multidimensionality of PSYOP escapes those responsible for development of doctrine. Military action is taken to influence a target audience, the very basis of PSYOP, and yet it is not planned to maximize the impact. The author proposes a reevaluation of PSYOP, vastly expanding its uses. Redefining military PSYOP as: activities undertaken by the military to influence a target audience's decision making process, including both military and non-military decisions; and initiatives involving other IOPs to impact a target audience's military; is but the first step in improved exploitation of the psychological factor. A similar intuitive argument can be made for the expansion for PSYOP as it relates to the diplomatic, economic, and informational IOPs.

Acknowledging the multidimensionality of PSYOP and recognizing its synergistic effect are not adequate. The author contends the U.S. must strive for a unity of effort within the multitudes of federal agencies to maximize the synergistic effect of integrating IOPs. At the present, there is no mechanism similar to the Soviet's centralized authority or President Reagan's SPG to integrate and coordinate efforts. The establishment of an oversight organization, responsible for incorporating IOPs into a comprehensive national marketing strategy aimed towards influencing decisions beneficial to U.S. interest, would increase the effectiveness of American actions. Lacking such an organization, the status quo of ad hoc efforts will continue to inefficiently utilize dwindling resources. In such an environment, the criticality of espousing and offering multidimensional military PSYOP activities, as part of a unified campaign designed to influence, rests squarely on the military.

Appendix A

Message Flow¹

Figure 4. Basic Message Flow Model

1. Sender develops a message that he believes will influence the receiver to take actions that support the sender's objectives. The type of message may be coercive, deterrent, or incentive.
2. Sender transmits the message via one or a combination of IOPs to develop a desired phenomena. An IOP application may include a military raid, economic sanctions, media campaign, U.N. resolutions, etc. or any combination.
3. Receiver observes the phenomena and integrates his perceptions as the phenomena is internalized.
4. Once internalized, the message influences the receiver and impacts the decision making process so that the receiver takes an action that either supports or opposes the sender's desired outcome or takes no action at all.
5. The action taken creates a phenomena that influences the sender's decision as to the applicability of the objective and message. The current course of action may be continued, a new message may be developed, or a different medium may be employed. In the extreme case, the sender may recognize original objectives are not attainable and must be changed.

In order to effectively influence a state to take actions and positions favorable to the U.S., one must first understand the importance of messages and their relationship to objectives of both the U.S. and target audience. Messages not only translate a sender's objectives into observable phenomena but also serve as the foundation of support and the impetus for change and must therefore be carefully developed.

The sender is responsible for identifying an unfulfilled objective and developing a message designed to influence the target audience in taking favorable actions. The message's basis (black, gray, white), its type (covert, overt), and purpose (coercive, deterrent, incentive), help identify the most appropriate medium(s) for the creation of an observable phenomena.

However, the control a sender has over the actual phenomena may be limited, since the planned activity may only be the first phase of an unfolding event that is impacted by numerous other factors. For instance, a military show of force may be met with international condemnation or broad domestic disapproval. This turn of events does not benefit the sender's objectives and it may bolster the target audience's objectives.

How the receiver perceives and internalizes the phenomena influences future decisions, resulting in behavior that either supports the sender's objectives or does not. The message flow process is then reversed as the receiver takes an action that creates a phenomena that is evaluated by the sender. Depending on the sender's interpretation of receiver's response, the message may be modified.

Notes

¹ The message flow process discussed originally appeared in *Twentieth Air Force Communications Strategy* and was developed by the author as a result of extensive discussions with Phillip Lacombe in 1993 and 1994. Lacombe was instrumental in the development of the Reagan Administration's Drug Policy, served in numerous senior public affairs positions throughout DoD, and is currently the Staff Director for the President's Commission for Critical Infrastructure Protection. Over the last three years it has evolved to its present state along with the following discussions on target audience and the action-influence model. Since 1994, it has been used by U.S. Space Command, U.S. Strategic Command, Air Force Space Command, and numerous subordinate units.

Appendix B

The Trinity Target Audience

Figure 5. Trinity Target Audience¹

Clausewitz identifies three pillars of a state, military, government, and population, that interact to establish objectives and interests. Although at different times, each may be the primary group molding events, none are capable of complete isolation from the influence of the others. Phenomena may be observed by members of any or all of the groups. Therefore, it is critical for the sender to identify the segment of society with the greatest impact as a target audience and develop a message designed to influence that particular group.

There is a great deal of communication both between and among the three groups. Military personnel advise government leaders, and may inform the general population of activities. The population may discuss issues with people in either of the two other

groups. This interaction is continuous even if official barriers inhibiting discussions are artificially instituted. Figure six highlights another basis for intergroup communications.

Not only is there interaction among the groups, but there are individuals who are members of more than one group. These people are direct links between and have inputs to different segments of society. This inherently increases the communications and information distribution among groups.

Figure 6. Target Audience Integration

Several military theorists and historians have begun to question the applicability of Clausewitz's trinity. Today transnational organizations play an increasingly powerful role in shaping world events. International corporations, cartels, drug syndicates, religious groups and U.N. agencies impact decisions made by governments, the military, and a state's populace. However, none appear to have changed the fabric of society and influenced the West Phalian state system more than the globalization of the media. Although some argue the media has transformed the trinity into a cube, others believe it is an element that permeates Clausewitz's three pillars.

If one accepts the premise that the media reports the news and strives to be impartial, then it is not a decision maker and should not be put on an equal footing with the other elements of the trinity. However, by reporting and at times interpreting events, the media does influence decisions and future actions. Its influence depends on how the reporting is

perceived and internalized. The perception and internalization may be different for members of the government, military, and population, but the media presents it to all three at the same time in the same manner. Therefore, the media can be seen as a critical input to the decision making process, and at times as a conduit to spread information on observable phenomena. If one accepts this, then the Trinity Plus One model in figure seven can be used to illustrate these relationships.

Figure 7. Trinity Plus One Model

The three sides represent Clausewitz's trinity of government, military, and population. Today, the media have become part of the fabric of society. Its permeation of all three segments is illustrated by partial inclusion in each. The purpose for the phenomena at the center, is that decisions are based on responses to the phenomena. Each segment may be influenced by the phenomena directly or via the media. Therefore, the arrows emanating out from the phenomena represent its direct influence, while the media intersection with each segment represents the phenomena's influence via the media.²

Notes

¹ A variation of the Trinity Target Audience appeared in *Twentieth Air Force Strategic Communications Strategy* in 1994 as The Message Triad. The premise discussed the relationship of external and internal audiences relating the Air Force to the general public.

² Discussions with Dr. Richard Muller and Major Ralph Millsap brought to light recent developments in interpretations of Clausewitz's work and the possible applicability the media has to his theories.

Appendix C

Target Audience Composition¹

Figure 8. Target Audience Composition

Within the three segments of society are distinct groups that have varying levels of influence over state interests and objectives. Individuals with the greatest decision making input are on the top of each pyramid, while the broad population base of the group forms its foundation. Generally information flows up and down within a group to accomplish required tasks. Although, each segment of the target audience trinity can be broken down into many small subgroups. Figure eight identifies the three primary levels.

POPULATION: The general population includes every man, woman, and child in the state. Membership in the next level excludes local and community leaders who gain their authority due to their political position. It is comprised of those people who are seen as local and regional community leaders, such as ministers, activists, businessmen, professionals, and anyone else that can influence people. National non-political leaders may involve consumer advocates, religious and civil rights leaders, union presidents, and industry leaders.

MILITARY: The military segment is very similar to the chain of command with some minor inclusions at both the top and base. The general military population includes family members, contractors, and communities where military operations occur. The purpose for their inclusion is that in states with similar situations to the U.S., military issues impacting this broader population have a direct impact on military operations. Civilian control (President, Secretary of Defense, etc.), when it applies, is considered an integral element of national military command.

GOVERNMENT: All three levels, local, regional, and national, involve individuals who work for the government, not including the military, and can influence the decision making process.

Figure nine builds on the interaction and composition of the trinity target audience. One audience may influence another level within that segment or another group. Members may also belong to more than one audience, expanding their ability to impact decisions. Interaction and communication knows no boundaries or established chain of commands. For instance, the Belgium dairy farmer, whose cows are frequently scared by low flying U.S. aircraft or chased by military members during operations, may be good friends with powerful political leaders in the Belgium government. They may then push for greater exercise restrictions that will have a negative impact on training and therefore military capabilities. During the debate over introducing U.S. Pershing and Ground Launched Cruise Missiles to bases in Europe, the Soviet Union employed a wide range of activities in an attempt to influence European popular opinion and prevent their deployment. Ultimately, the missiles were installed at great political cost, but upgrades to their companion short range system's Lance launchers were prevented in West Germany.²

Identifying the right target audience is critical for either directly or indirectly influencing decisions. The key is one must always remember the objective and desired outcome required to achieve it. In the above situation, if an adversary wanted to reduce military effectiveness, the farmer and others like him may be the easiest and most appropriate target audience to influence. In order to get a similar result in another situation the hiring of a lobbyist to approach U.S. congressmen may be more appropriate.

Figure 9. Audience Interaction

Notes

¹ Similar to the Message Flow Process and Trinity Target Audience, a variation of the target audience composition and integration themes was developed by the author as a result of extensive discussions with Phillip Lacombe in 1993-1994 and first appeared in *Twentieth Air Force Strategic Communications Strategy*, 1994. Over the last three years it has evolved to its present state. Since 1994, it has been used by U.S. Space Command, U.S. Strategic Command, Air Force Space Command, and numerous subordinate units.

Appendix D

Action-Influence Model

The *Action-Influence Model* (AIM) has four interlinking phases -- analysis, projection, internalization, and feedback -- that identify the process of influencing a target audience to take actions or modify behavior in favor of the sender's objectives and interests.

Figure 10. Four Phases of the Action-Influence Model

During the initial analysis phase the sender determines an unfulfilled objective, the appropriate target audience that will have the greatest impact on achieving the objective, and the message that will most likely influence the target audience. The projection phase incorporates the activities required to transmit the desired message and ends with an

observable phenomena. Col John Boyd’s decision making “OODA Loop” model serves as the basis for the internalization phase. Beginning with the observable phenomena, the target audience internalizes the projected message, resulting in an action that may or may not support the sender’s objective.¹ During the final feedback phase, the sender re-evaluates the objective and message in relation to the action taken by the target audience and reactions by other audiences.

Figure 11. AIM Analysis Phase

ANALYSIS PHASE: The analysis phase begins with an evaluation of the state’s objectives and the selection of a primary objective that serves to focus efforts. After the objective is selected, a determination must be made as to what outcome is required for its satisfaction. Once a desired outcome is identified, a target audience must be selected. Discovering the target audience requires an analysis of the government, military, and population audiences and a further refinement as to the group that has, either directly or indirectly, the greatest influence over decisions relating to actions impacting primary objective achievement.

After the target audience is selected, a message designed to influence decisions and actions must be developed. Several decisions must be made regarding the message’s purpose before a course of action is selected. If the desired outcome requires the reversal of policy, the message will be coercive. If it involves the prevention of some future action, then it is deterrent. Finally, if its aim is to influence decisions that have not been made, it will be incentive. The sender must also determine the message’s factual basis, black, gray, or white. Will the premise be based on lies and deception or verifiable facts? This determination may play a role in deciding if the message should be overt or covert.

However, a message designed to deceive and based on half-truths may be projected via overt means as witnessed by the Soviet Union's elaborate missile gap deception.

PROJECTION PHASE: Message development signals the completion of the analysis phase and the initiation of the projection phase. After the message is determined, the most appropriate IOP or combination of IOPs must be identified. Although all IOPs may not directly support the message, it is critical that they do not send mixed signals and counteract initiatives. Once the IOP(s) has been selected, options required to result in a phenomena that will project the desired message must be developed and implemented. It must be noted, the sender does not have complete control over phenomena creation. Fog and friction from other inputs will also influence events.

Figure 12. AIM Projection Phase

INTERNALIZATION PHASE: The resulting projection phase's observable phenomena begins the internalization phase. Similar to Boyd's OODA Loop, the phenomena must be observed before a decision resulting in an action can be made. The target audience's observation is interpreted using both contextual and operational frameworks. In addition to the target audience's interpretation, other audience interpretations influence the final decision. Implicit in the decision is its reaction to the message, either support, opposition or indifference to the primary objective. Unlike Boyd, however, AIM does not seek to break down a target audience's OODA Loop by rapidly changing decision making inputs and parameters.² Rather, it seeks to retain (to the maximum extent possible) the ability to predict and influence decisions and actions. It is critical to recognize that audiences influencing the sender may also observe and internalize the phenomena and communicate their decision making inputs.

Figure 13. AIM Internalization Phase

FEEDBACK PHASE: The core of the feedback phase centers around the re-evaluation of the message, medium, and objective in relation to the target audience’s actions taken and inputs from domestic and other critical audiences (allies, world organizations, industry groups, etc.). If the target audience’s actions result in or move towards the original desired outcome, then the current message and mediums employed may be continued or intensified. If not, the message or mediums may need to be changed or modified. In extreme cases, objectives may also have to be changed.

Figure 14. AIM Feedback Phase

PUTTING IT ALL TOGETHER--AN AIM EXAMPLE

Figure 15 incorporates the four phases of AIM. The following hypothetical scenario involving the U.S. and Indonesia is presented to aid in better understanding of the model.

Analysis phase: According to the National Security Strategy of Enlargement and Engagement, the U.S. has three grand objectives: enhancing security; promoting domestic prosperity; and promoting democracy.³ For this exercise, promoting domestic prosperity is the primary objective. From that, ensuring adequate oil supplies to the U.S. and its allies can be one of the many supporting objectives established. Increasing oil imports from Indonesia is seen as the desired outcome.

Through analysis of Indonesia's government, military, and population audiences, several key factors come to light. The government desires to increase oil exports. However, they lack the investment and physical capital needed. China accounts for nearly 75 percent of Indonesia's total trade. They coerce fifty percent of Indonesia's production at below market prices with the threat of trade sanctions and implied annexation of offshore oil reserves. Finally, the population is yearning for increased standards of living, but due to the lack of oil industry development and artificial prices, no significant economic relief is foreseen in the future. Since China is in the middle of rapid economic expansion, influencing the government to decrease pressure on Indonesia is unlikely. Therefore, the U.S. must develop a strategy to reduce China's influence.

Figure 15. Action-Influence Model

At first look, the Indonesian government appears to be the audience that should be directly targeted, since they control critical export decisions. However, further analysis reveals that the economic prosperity of the general population is the driving factor for oil export allocations. The Indonesian government cannot afford to lose its largest trading partner and must concede to China's demands. Therefore, coercing Indonesia to sell the U.S. more oil would greatly damage the economy and result in even more problems as China began sanctions. Since Indonesia already sells oil to China, the U.S. could work to deter

an increase in sales to the mainland, but since Indonesia is already near oil production capacity, this would provide very little oil for U.S. purchases.

Given this situation, the U.S. should develop an incentive message. One possible message targeting the population may be: “China is experiencing rapid economic growth at the expense of holding back the Indonesian people’s prosperity. Establishing better relationships with the U.S. and its allies will improve the standard of living.” Note, this message does not mention oil. However, to increase oil exports to the U.S., economic improvement must be credited to America by the people and government of Indonesia, thereby reducing China’s ability to leverage their economic IOP. Otherwise, China may take credit and attempt to gain even greater influence. Therefore, this points to a message based on facts and overtly pursued. A PSYOP campaign that is incentive-white-overt.

Projection phase: The desired phenomena to project the above message would be signs of economic improvement not based on Chinese needs or demands. All four IOPs can be coordinated to pursue what at first appears to be an economic issue. The U.S. could lower tariffs and enter into special trade agreements on Indonesian products. Diplomatic efforts may be pursued to encourage other states to do the same. American industry may be provided incentives to do business and cooperative efforts with and upgrades to Indonesian companies. The U.S. Navy can schedule Indonesian locations for port calls, thereby showing the flag and implying American military support against Chinese military threats. Agreements for exploration and exploitation by American oil companies for oil exports to the U.S. and mutual security assurances to protect offshore oil deposits where U.S. companies are working may increase the available oil. Finally, an active public relations effort to ensure everyone is aware of the successful initiatives the U.S. has taken to improve the Indonesian economy would round out the package.

Internalization phase: If the phenomena created from the projection phase increases the Indonesian people’s standard of living, they will then in-turn work to influence the government to move towards better relations with the U.S. However, secondary audiences such as China may view the phenomena as a challenge to their ability to control Indonesian oil and react in a negative fashion, possibly threatening military intervention or trade restriction. In this case, American military assurances counter balance the threat of military intervention. Additionally, Indonesia’s economy has diversified and is no longer dependent on Chinese imports. Therefore, the action taken is to increase oil exports to the U.S. and its allies at the expense of China.

Feedback phase: Indonesia’s increase of oil exports to the U.S. was the original desired outcome. Therefore, it can be said that American efforts to influence events in Indonesia were successful and the outlook for domestic prosperity is improved. However, the selection of multiple IOPs and implementation options were critical for successfully influencing the Indonesian people. If only a military show of force or assurances for the Indonesian sovereignty of oil reserves was employed, China would have still had the leverage of reducing trade and damaging the economy. On the other hand, if only business incentives were used, China may have taken control of the oil fields.

Situations demand coordinated IOP efforts developed to create a desired phenomena that will influence the target audience to make decisions favorable to U.S. interests and objectives.

Notes

¹ John R. Boyd, “A Discourse on Winning and Losing,” (August 1987), a series of unpublished presentations. Air University Library Document No. M-U 43947. Boyd emphasized “shaping” the adversary’s impressions and perceptions of events. His objective was a rapidly changing environment such that the enemy’s OODA loop, (observation-orientation-decision- action) decision making process could not adequately react, thereby becoming disorganized. Major David S. Fadok provides an analysis of Boyd’s work in *John Boyd and John Warden, Air Powers Quest for Strategic Paralysis*.

Appendix E

Legitimizing the Soviet Missile Gap: A Chronology of Events

The following chronology of events prior to, during, and after the missile gap deception illustrate the broad range of IOPs and activities the Soviets employed from 1957 to 1962. A significant portion of this is based on the work of Horelick and Rush. Unless otherwise noted, English translations of comments attributed to Soviet publications and presentations came from their work. Text appearing in italics is an analysis of a particular entry or events leading up to it.

1. Mid-late 1950's. Due to the actual limited number of operational first generation ICBMs deployed by the Soviets, Horelick believes the decision to proceed with a limited program was made sometime between 1955 and 1958.

This is consistent with attempts by the Soviets to begin legitimizing the stature of their ICBMs even before they possessed an operational force.¹

2. 1955. West accepts Soviet strategic bomber claims.

Although the Soviet strategic bomber capabilities were very limited and far inferior to U.S. forces, their successful deception program identified a potential soft spot in western defense analysis, setting the stage for future deception plans.

3. July 55. U.S. eager to move forward with détente.

During discussion in Geneva, Soviet Premier Bulganin and senior leadership recognized the potential for an asymmetrical relationship with the West. In order to support détente, Western leaders were willing to make major concessions in comparison to the Soviets' relatively minor gestures.

4. 5 Nov 55. Suez Crisis--Soviet Premier Bulganin sends messages to France and Great Britain calling for a cease-fire with Egypt. The day prior to its delivery in London and Paris, the Soviets released the message's basic information through news services threatening the use of rockets if both countries did not terminate hostilities with Egypt. The next day, both France and Great Britain ordered a cease fire, primarily due to U.S. pressure. Many believe Soviet threat resulted in termination.

The message delivered to France and Great Britain was not as threatening as the Soviet news stories indicated. However, this procedure of issuing ultimatums to gain support in situations that had already been decided and alluding to nuclear missile attack became a mainstay of Soviet foreign policy for the next few years. This garnered strong support for the Soviets, especially in the communist and third world nations. In addition, due to their boasts and apparent reactions to the ultimatums, it established a de facto legitimate nuclear missile capability since they were never challenged.²

5. 26 Aug 57. Soviets announce successful test of a “super, long distance intercontinental multi-stage ballistic rocket . . . (that) landed in the target area” and reiterate information on recent high altitude nuclear detonation tests. They claim they were forced to develop this ultimate weapon in response to Western threats.

Although the launch was a surprise to most of the world, U.S. intelligence was aware of at least six successful ICBM tests prior to this. This brings up the Soviet’s keen sense of timing to maximize impact. Arms control negotiations had not been going well for them and U.N. hearings on their participation in putting down the recent Hungarian revolt were scheduled within the next few weeks. TASS statements alluded to either a current or soon to be operational nuclear capability of the rocket by re-reporting the nuclear atmospheric tests. Accuracy was implied by claiming it landed in the “target area.” The target area could have been all of Siberia. Finally, by claiming they were “forced” to develop such a terrible weapon, they began efforts to put the West and particularly the U.S. on the defensive in World opinion.³

6. 27 Aug 57. Soviets reject Western arms control initiatives and charge they are “actually sabotaging the reaching of an agreement” and call for the renouncing of “atomic and hydrogen weapons, including aerial bombs, rockets of any type with atomic or hydrogen warheads, atomic artillery, and so on.”

Soviets continue to work on their image as peaceloving people who were forced to develop the weapon that they would gladly give-up if the West agreed to their arms control proposals.⁴

7. 28 Aug 57. Soviets claim ICBMs can successfully strike strategic bomber facilities in U.S. and allied countries.⁵
8. 28 Aug 57. In an official White House statement, Pres. Eisenhower acknowledges as noteworthy “the boastful statement made by the Soviet Union that they have made advances in the development in means of bringing destruction to any part of the world.”

President Eisenhower’s statement lends credibility to Soviet claims and may be seen as acknowledging their ability to bring “mass destruction to any part of the world,” including the bomber bases Soviets allude to.⁶

9. 29 Aug 57 *Washington Post*: “Pentagon Embarrassed, Reds Say,” and “Rocket ‘Guarantees’ Ruin, Red Says.” TASS and other communist news outlets report on failure of U.S. Atlas test launch, reprint stories from other papers discussing recent launch, call U.S. policy bankrupt, and claims the “most reasonable reaction” is to agree to Soviet arms control terms.

Soviets begin to further legitimize their ICBM claims by re-printing stories from other papers. Many of these stories were found in Western papers and based on TASS reports, while others were Soviet stories planted in communist and front organization papers. In other words, they were writing news stories that were based on their original claims, beginning an endless cycle.

10. 29 Aug 57. Arms control negotiators return home. Soviets recommend moving talks to the U.N. and reiterate call “for elimination of military bases or withdrawal of troops from foreign territories.”

The abrupt change in Soviet negotiation tactics and new hard-line positions alluded to a change in the world power balance that did not exist. However, the image the Soviets portrayed was that they were in charge and could now push for the removal of U.S. forces from overseas facilities.⁷

11. 29 Aug 57. Senator Henry Jackson calls for re-evaluation of U.S. ICBM program and charges administration with slowdown. “It would be very hazardous for the United States to dismiss the ICBM claim as propaganda. . . . It would be a very disastrous blow to our own people and our Allies should the Soviets win this race, because it would represent the first time the United States has failed to win a race involving an important weapon system.”

Powerful voices within the U.S. government begin to question the balance of world power. Sen. Jackson, along with others, successfully pushed for an increase in U.S. ICBM funding and accelerating development programs. However, public comments and debate led to a growing belief that the U.S. had fallen behind, legitimizing Soviet claims.

12. 30 Aug 57. *Washington Post* headlines: “TASS Accuses U.S. Press of ‘Hysteria’ on Missile,” “Reds Fire 6 Missiles Of Intercontinental Range Over Siberia,” “Reds Zoom Ahead In Missile Race.”

These headlines represent the rapid escalation of Western response. The Soviets continue to espouse that the West has nothing to fear from them. Hysteria is unwarranted since the Soviets are peaceloving and willing to give up these terror weapons.

13. Late Aug 57. Western European response similar to *Westdeutsche Allgemeine Zeitung*, “This country’s security has been based mainly in the impregnability of the United States. Will this protection now cease to exist?”

Allies begin to question the deterrent value of America's strategic bombers. The protective nuclear umbrella they had come to depend on to prevent Soviet aggression was not as dependable. This was a key theme the Soviets continued to hammer home as they worked to create a rift in NATO.

14. Early Sep 57. Soviet scientist claims accuracy within 12.4 miles.

This level of accuracy implies the ICBM is a terror weapon, only applicable to very large soft targets similar to cities.⁸

15. 9 Sep 57. Zorin claims, "The statesmen of the U.S. and NATO openly proclaim that they are preparing for atomic war against the peace loving states."

Once again, the image of Soviets as peace loving people, who only want world harmony is brought to the forefront as the U.N. prepares to begin discussions.⁹

16. Mid-Sep 57. U.N. General Assembly sessions on Hungarian Revolt.

17. 4 Oct 57. USSR successfully launches Sputnik I.

Soviets pursue efforts to link space achievements to military capabilities. USIA reports indicate they were successful.¹⁰

18. 3 Nov 57. Sputnik II successfully launched.¹¹

19. Mid-Nov 57. Khrushchev: "I think it is no secret that there now exists a range of missiles with the aid of which it is possible to fulfill any assignment of operational and strategic importance."

Building on recent Soviet space achievements, Khrushchev connects space capabilities with military weapon systems. Official statements can be seen as following a logical sequence continuing to remain ambiguous while creating the belief of a plausible ICBM capability in the West.¹²

20. 1958 (date unknown) Senator John F. Kennedy warns that Soviet missile superiority will threaten U.S. security within the next two to six years.

The missile gap and Soviet superiority are accepted by the majority of Western leaders.¹³

21. 10 Nov 58. Berlin Crisis begins.

A new Soviet hard-line surprised the West. The only significant change in the world situation was the Soviet ICBM development. Therefore, they must have a strong ICBM force to risk war over Berlin.

22. 19 Mar 59. Khrushchev: "If such a country as ours, which occupies one-sixth of the globe, can, as they assert, be destroyed in a brief period of time, how much time is

needed to destroy other smaller countries, the allies of the United States, by resorting to the same means with which we are threatened? If the American generals and admirals ignore their own allies and write them off, it is their own affair.”

Note that the U.S. is not threatened here. ICBMs are being used as a wedge in possible Western Alliance cracks. ICBMs are not mentioned in this comment, however, since the Soviets did not have a capable bomber force, the implication is that rockets either land or submarine launched would be used against U.S. allies.

23. 9 May 59. Khrushchev claims the Soviet Union has “enough rockets for America, too, should war be unleashed against us. . . . They allege that the Soviet Union has few intercontinental rockets. They would have you believe that the United States stands to lose least from a war. Even if this were true, does this make you Germans feel any better.”

Further efforts to break-up NATO and sway public opinion directly targeted at West Germany.

24. 29 May 59. Khrushchev states if attacked, they will destroy the rocket bases targeting them. “They are located not in bare rocky country, but where people live. But the governments of countries which provide territory for rocket bases of a transoceanic power for some reason do not take the vital interest of their peoples into account.”

A direct attempt to influence Great Britain, threatening the general population and preventing deployment of U.S. Thor missiles to the British Isles. The transoceanic power can only be seen as the U.S. If Thors were deployed to Great Britain, then Europe had more than just a nuclear bomber umbrella to protect them.

25. 1 Jun 59. Khrushchev declares, “The imperialists know our strength. To attack us is tantamount to suicide; one would have to be insane for this. I do not believe they are as stupid as all that; they understand the consequences which the unleashing of war against the socialist countries may have for them.”

More threats implying non-existent Soviet ICBM capabilities.

26. 30 July 59. Khrushchev to the Party Central Committee: “A situation has at present been created in which the imperialists will hardly dare to launch a war against our motherland or against the countries of socialism. Our forces and those of our socialist allies are colossal and in the West, apparently, this is now understood.”

27. 11 Oct 59. Khrushchev: “We now have all the rockets we need: long-range rockets, intermediate-range rockets and short range rockets.”

Although many may interpret this to imply the Soviets possessed the quantity of rockets required to threaten the U.S., in actuality Khrushchev was addressing the different types of rockets.

28. Nov 1959. Khrushchev: "We now have stockpiled so many rockets, so many atomic and hydrogen warheads, that, if we were attacked, we could wipe from the face of the earth all our probable opponents."

By not including bombers, Khrushchev infers the Soviets possess enough operational ICBMs to destroy the U.S. However, it has become generally accepted that Khrushchev did not view the U.S. as a serious threat to the survival of the Soviet Union as long as the Soviets did not threaten vital U.S. interest. It can be argued then that the U.S. was not viewed as a likely opponent that would attack.

29. 29 Nov 59. Khrushchev: "The Soviet Union has intercontinental ballistic rockets with hydrogen warheads."

30. 1 Dec 1959. U.S. Secretary of Defense McElroy calls for 24-hour airborne strategic bomber alert to offset possible missile gap. Pres. Eisenhower rejected this concept but supported a standby alert capability.

The missile gap was accepted at all levels of government and the possible vulnerability of U.S. bombers to a surprise first strike became a growing concern for both the U.S. and its allies.

31. 15 Jan 60. Khrushchev to Supreme Soviet: "We already have enough nuclear weapons, atomic and hydrogen, and the corresponding rockets to deliver this weapon to the territory of a possible aggressor, that if some madman stirred up an attack on our state or on other socialist states we could literally wipe from the face of the earth the country or countries that attacked us."

For the first time, Soviets connect sufficient nuclear weapons and the technology to place them on rockets. By including aggression against other socialist states, Khrushchev is implying the missiles are ICBMs.

32. Jan 60. Soviets claim successful test launch of space program rocket over 6,500 nautical miles.

Soviets continue to use scientific accomplishments as the basis for military claims. If a space rocket has a range of 6,500 nautical miles, then extending the range of other rockets is not difficult.

33. 15 Jan 60. Minister of Defense, Marshall Malinovsky: "The building of large, expensive airfields with complicated equipment is not required for launching rockets. It is far easier to camouflage and even completely conceal rocket-launch positions; this guarantees a higher degree of security and invulnerability for rocket weapons."

After U-2 flights, U.S. begins to question Soviet claims. Malinovsky uses Western doubt to his advantage and claims that ICBMs can not be discovered.

34. 31 Jan 60. U.S. statements point to much smaller Soviet operational ICBM capabilities than claimed. Soviets respond and say the “data” available to CIA Director, Allen Dulles is of little value. “To calculate in Washington the number of rockets and other types of Soviet arms is of as little use as counting crows on the fence . . . How many rockets do we have? Enough! Enough to wipe from the face of the earth any country that dares attack the Soviet Union.”

Confident Soviet claims continue to fuel the Missile Gap deception.

35. 11 Feb 60. Survey of Western European nations reveals Soviet Union is viewed as militarily superior to the U.S.

Soviet deception efforts have succeeded in Western Europe. If the deception had not begun to unravel within the next few months, long term effects may have severely threatened the U.S. position and strained NATO.

36. Feb 1960. U.S. intelligence estimates of Soviet ICBMs reduced 66 percent from 1958-Jan 1960 estimates.¹⁴

37. Mid 60. Berlin Crisis discussions

38. Jun 1960. U.S. Intelligence estimates of Soviet ICBMs reduced 50 percent from Aug 1960 estimates, resulting in an 85 percent reduction since Jan 1960 estimate.

39. Jun 60. 45 percent to 15 percent of Norway opinion survey respondents believe the Soviet Union is militarily stronger.

U.S. intelligence reports had not been made public at this time. Soviet deception efforts were still having a strong impact on Western states.

40. Aug 1960. U.S. intelligence estimates of Soviet ICBMs reduced four percent from Feb 1960 estimate, resulting in 70 percent reduction since Jan 1960 estimate.

41. Late 1960 to 1961. Defense spending increases gain momentum as Kennedy administration pushes for \$14 billion more in outlays over Pres. Eisenhower’s plans. U.S. strategic systems receive \$6 billion of the increase, primarily improving ICBM capabilities. In 1997 terms, these increases equal \$76 billion and \$32.5 billion.

Missile deception results in enormous additional defense spending to overcome the gap.

42. May 1961. Marshall Grechko, senior Warsaw Pact officer: “Soviet rocket troops (are) now able to destroy aggressors at any point on earth.”

Operational Soviet ICBMs continue to be portrayed as a significant threat to the U.S.

43. Mid-late 1961. Kennedy administration aggressively works to overcome inaccurate public opinion of Soviet superiority by supporting policies and actions that demonstrate American strategic capabilities.¹⁵

44. Sep 1961. U.S. intelligence estimates of Soviet ICBMs reduced to a level only 3.5 percent of Jan 1960 estimate, resulting in a total downward estimate of 96.5 percent in 19 months.

45. 21 Oct 61. Deputy Secretary of Defense, Roswell Gilpatric: "The fact is that this nation has a nuclear retaliatory force of such lethal power that an enemy move which brought it into play would be an act of self-destruction on his part. ...we have a second strike capability which is at least as extensive as what the Soviets can deliver by striking first."

*The Soviet ICBM bluff is called and the U.S. moves to correct the image of an inferior military capability.*¹⁶

46. 23 Oct 61. Malinovsky responds to Gilpatric comments. "Brandishing the might of the United States, he (Gilpatric) threatened us with force. What can one say to this one more threat, to this petty statement? . . . this threat does not frighten us."

Soviets challenge and attempt to discredit U.S. claims of superiority and Soviet inferiority.

47. 19 Jan to 2 Feb 62. Secretary of Defense McNamara acknowledges overestimates of Soviet ICBM capabilities during congressional testimony.

48. 25 Jan 62. Malinovsky: ". . . we are capable of wiping from the face of the earth with one rocket-nuclear blow any targets, all the industrial and administrative-political centers of the U.S.A."

49. 31 Jan 62. Radio Moscow implies security arrangements between the U.S. and Japan are based on false U.S. capability claims and "the Soviet Union with its nuclear rockets is capable of annihilating with one blow those countries which have permitted other countries to maintain military bases in areas adjacent to the Soviet Union and other socialist countries."

Soviets return to the strategy of threatening U.S. allies and de-emphasizing ICBM capabilities.

50. 2 Feb 62. Soviet Admiral Gorshkov in comments targeting Turkey for its participation in NATO and CENTO said if war comes, ". . . a nuclear rocket blow will, of course, be inflicted on Turkey. After that, the assistance (the NATO Mediterranean Fleet) promises to Turkey will certainly not be asked for, because it will not be needed anymore."

51. 29 June 62. Radio Moscow: “No appeals that blows should be directed only at military objectives could prevent the all-devastating counter-blow at the economic, transportation, military, and administrative centers of the United States and its allies.”

Pres. Kennedy’s announcement that the U.S. may consider limited nuclear responses alludes to a possible U.S. first strike. The U.S. may be starting to implement the nuclear blackmail the Soviets feared.

52. Sept-Oct 62. Cuban Missile Crisis

One final effort to hold significant numbers of U.S. targets at risk compensating for the inadequate Soviet ICBM program. Khrushchev’s willingness to back down highlights the Soviets inability to project intercontinental power. The Cuban Missile Crisis signaled the death knell for Soviet ICBM claims.

53. 1 Dec 62. Secretary of Defense, Robert McNamara: “The ending of a myth has made it possible to take a firm line with our adversaries and at the same time reassure our friends that we are strong and determined to use our strength if we have to.”

Secretary McNamara further acknowledges the missile gap deception influenced U.S. policies and increased allies’ apprehension.

54. 1964. Soviets expand military and economic aid programs to countries such as Indonesia, United Arab Republic, and Algeria.

Threats aimed at the U.S. and its allies no longer impact world events. The Soviets turn to other methods of influence.

55. 14 Apr 64. DoD admits Soviets deployed only “a handful” of operational ICBMs.

56. Feb 65. U.S. begins bombing campaign against North Vietnam, without Soviet response as had been implied over the previous eight years.

57. Apr 65. Secretary McNamara discussing the current situation of U.S. Soviet strategic relationship: “(The Soviets) have decided that they have lost the quantitative race, and they are not seeking to engage us in that contest . . . There is no indication that the Soviets are seeking to develop a strategic nuclear force as large as ours.”

Declassify/Release 7/16/84
under provision E.O. 12356
by D. Van Tassel, National Security Council
F74-1102

U.S. RELATIONS WITH THE USSR (S)

U.S. policy toward the Soviet Union will consist of three elements: external resistance to Soviet imperialism; internal pressure on the USSR to weaken the sources of Soviet imperialism; and negotiations to eliminate, on the basis of strict reciprocity, outstanding disagreements. Specifically, U.S. tasks are:

1. To contain and over time reverse Soviet expansionism by competing effectively on a sustained basis with the Soviet Union in all international arenas -- particularly in the overall military balance and in geographical regions of priority concern to the United States. This will remain the primary focus of U.S. policy toward the USSR.
2. To promote, within the narrow limits available to us, the process of change in the Soviet Union toward a more pluralistic political and economic system in which the power of the privileged ruling elite is gradually reduced. The U.S. recognizes that Soviet aggressiveness has deep roots in the internal system, and that relations with the USSR should therefore take into account whether or not they help to strengthen this system and its capacity to engage in aggression.
3. To engage the Soviet Union in negotiations to attempt to reach agreements which protect and enhance U.S. interests and which are consistent with the principle of strict reciprocity and mutual interest. This is important when the Soviet Union is in the midst of a process of political succession. (S)

In order to implement this threefold strategy, the U.S. must convey clearly to Moscow that unacceptable behavior will incur costs that would outweigh any gains. At the same time, the U.S. must make clear to the Soviets that genuine restraint in their behavior would create the possibility of an East-West relationship that might bring important benefits for the Soviet Union. It is particularly important that this message be conveyed clearly during the succession period, since this may be a particularly opportune time for external forces to affect the policies of Brezhnev's successors. Shaping the Soviet Environment: Arenas of Engagement

Implementation of U.S. policy must focus on shaping the environment in which Soviet decisions are made both in a wide variety of functional and geopolitical arenas and in the U.S.-Soviet bilateral relationship. (S)

A. Functional

1. Military Strategy: The U.S. must modernize its military forces -- both nuclear and conventional -- so that Soviet leaders perceive that the U.S. is determined never to accept a second place or a deteriorating military posture. Soviet calculations of possible war outcomes under any contingency must always result in outcomes so unfavorable to the USSR that there would be no incentive for Soviet leaders to initiate an attack. The future strength of U.S. military capabilities must be assured. U.S. military technology advances must be exploited, while controls over transfer of military related/dual-use technology, products, and services must be tightened. (S)

In Europe, the Soviets must be faced with a reinvigorated NATO. In the far East we must ensure that the Soviets cannot count on a secure flank in a global war. Worldwide, U.S. general purpose forces must be strong and flexible enough to affect Soviet calculations in a wide variety of contingencies. In the Third World, Moscow must know that areas of interest to the U.S. cannot be attacked or threatened without risk of serious U.S. military countermeasures. (S)

2. Economic Policy: U.S. policy on economic relations with the USSR must serve strategic and foreign policy goals as well as economic interests. In this context, U.S. objectives are:

- Above all, to ensure that East-West economic relations do not facilitate the Soviet military buildup. This requires prevention of the transfer of technology and equipment that would make a substantial contribution directly or indirectly to Soviet military power.
- To avoid subsidizing the Soviet economy or unduly easing the burden of Soviet resource-allocation decisions, so as not to dilute pressures for structural change in the Soviet system.
- To seek to minimize the potential for Soviet exercise of reverse leverage on Western countries based on trade, energy supply, and financial relationships.
- To permit mutual beneficial trade -- without Western subsidization or the creation of Western dependence -- with the USSR in non-strategic areas, such as grains. (S)

3

The U.S. must exercise strong leadership with its Allies and others to develop a common understanding of the strategic implications of East-West trade, building upon the agreement announced November 13, 1982 (see NSDD 66). This approach should involve efforts to reach agreements with the Allies on specific measures, such as: (a) no incremental deliveries of Soviet gas beyond the amounts contracted for from the first strand of the Siberian pipeline; (b) the addition of critical technologies and equipment to the COCOM list; the harmonization of national licensing procedures for COCOM, and the substantial improvement of the coordination and effectiveness of international enforcement efforts; (c) controls on advanced technology and equipment beyond the expanded COCOM list, including equipment in the oil and gas sector; (d) further restraints on officially-backed credits such as higher down payments, shortened maturities and an established framework to monitor this process; and (e) the strengthening of the role of the OECD and NATO in East-West trade analysis and policy. (S)

In the longer term, if Soviet behavior should worsen, e.g., an invasion of Poland, we would need to consider extreme measures. Should Soviet behavior improve, carefully calibrated positive economic signals, including a broadening of government-to-government economic contacts, could be considered as a means of demonstrating to the Soviets the benefits that real restraint in their conduct might bring. Such steps could not, however, alter the basic direction of U.S. policy. (S)

3. Political Action: U.S. policy must have an ideological thrust which clearly affirms the superiority of U.S. and Western values of individual dignity and freedom, a free press, free trade unions, free enterprise, and political democracy over the repressive features of Soviet Communism. We need to review and significantly strengthen U.S. instruments of political action including: (a) The President's London initiative to support democratic forces; (b) USG efforts to highlight Soviet human rights violations; and (c) U.S. radio broadcasting policy. The U.S. should:

- Expose at all available fora the double standards employed by the Soviet Union in dealing with difficulties within its own domain and the outside ("capitalist") world (e.g., treatment of labor, policies toward ethnic minorities, use of chemical weapons, etc.).
 - Prevent the Soviet propaganda machine from seizing the semantic high-ground in the battle of ideas through the appropriation of such terms as "peace." (S)
- B. Geopolitical
1. The Industrial Democracies: An effective response to the Soviet challenge requires close partnership among the industrial democracies, including stronger and more effective collective defense arrangements. The U.S. must provide strong leadership

~~SECRET~~ ~~SENSITIVE~~

~~SECRET~~ ~~SENSITIVE~~

15 of 12 copies

~~SECRET~~ SENSITIVE

~~UNCLASSIFIED~~

4

and conduct effective consultations to build consensus and cushion the impact of intra-alliance disagreements. While Allied support of U.S. overall strategy is essential, the U.S. may on occasion be forced to act to protect vital interests without Allied support and even in the face of Allied opposition; even in this event, however, U.S. should consult to the maximum extent possible with its Allies. (S)

2. The Third World: The U.S. must rebuild the credibility of its commitment to resist Soviet encroachment on U.S. interests and those of its Allies and friends, and to support effectively those Third World states that are willing to resist Soviet pressures or oppose Soviet initiatives hostile to the United States, or are special targets of Soviet policy. The U.S. effort in the Third World must involve an important role for security assistance and foreign military sales, as well as readiness to use U.S. military forces where necessary to protect vital interests and support endangered Allies and friends. U.S. policy must also involve diplomatic initiatives to promote resolution of regional crises vulnerable to Soviet exploitation, and an appropriate mixture of economic assistance programs and private sector initiatives for Third World countries. (S)

3. The Soviet Empire: There are a number of important weaknesses and vulnerabilities within the Soviet empire which the U.S. should exploit. U.S. policies should seek wherever possible to encourage Soviet allies to distance themselves from Moscow in foreign policy and to move toward democratization domestically. (S)

(a) Eastern Europe: The primary U.S. objective in Eastern Europe is to loosen Moscow's hold on the region while promoting the cause of human rights in individual East European countries. The U.S. can advance this objective by carefully discriminating in favor of countries that show relative independence from the USSR in their foreign policy, or show a greater degree of internal liberalization. U.S. policies must also make clear that East European countries which reverse movements of liberalization, or drift away from an independent stance in foreign policy, will incur significant costs in their relations with the U.S. (S)

(b) Afghanistan: The U.S. objective is to keep maximum pressure on Moscow for withdrawal and to ensure that the Soviets' political, military, and other costs remain high while the occupation continues. (S)

(c) Cuba: The U.S. must take strong countermeasures to affect the political/military impact of Soviet arms deliveries to Cuba. The U.S. must also provide economic and military assistance to states in Central America and the Caribbean Basin threatened by Cuban destabilizing activities. Finally, the U.S. will seek to reduce the Cuban presence and influence in southern Africa by energetic leadership of the diplomatic effort to achieve a Cuban withdrawal from Angola, or failing that, by increasing the costs of Cuba's role in southern Africa. (S)

~~UNCLASSIFIED~~ 15 Jul 12 copies

~~SECRET~~ SENSITIVE

~~UNCLASSIFIED~~

5

(d) Soviet Third World Alliances: U.S. policy will seek to limit the destabilizing activities of Soviet Third World allies and clients. It is a further objective to weaken and, where possible, undermine the existing links between them and the Soviet Union. U.S. policy will include active efforts to encourage democratic movements and forces to bring about political change inside these countries. (S)

4. China: China continues to support U.S. efforts to strengthen the world's defenses against Soviet expansionism. The U.S. should over time seek to achieve enhanced strategic cooperation and policy coordination with China, and to reduce the possibility of a Sino-Soviet rapprochement. The U.S. will continue to pursue a policy of substantially liberalized technology transfer and sale of military equipment to China on a case-by-case basis within the parameters of the policy approved by the President in 1981, and defined further in 1982. (S)

5. Yugoslavia: It is U.S. policy to support the independence, territorial integrity and national unity of Yugoslavia. Yugoslavia's current difficulties in paying its foreign debts have increased its vulnerability to Soviet pressures. The Yugoslav government, well aware of this vulnerability, would like to reduce its trade dependence on the Soviet Union. It is in our interest to prevent any deterioration in Yugoslavia's economic situation that might weaken its resolve to withstand Soviet pressure. (S)

C. Bilateral Relationships

1. Arms Control: The U.S. will enter into arms control negotiations when they serve U.S. national security objectives. At the same time, U.S. policy recognizes that arms control agreements are not an end in themselves but are, in combination with U.S. and Allied efforts to maintain the military balance, an important means for enhancing national security and global stability. The U.S. should make clear to the Allies as well as to the USSR that U.S. ability to reach satisfactory results in arms control negotiations will inevitably be influenced by the international situation, the overall state of U.S.-Soviet relations, and the difficulties in defining areas of mutual agreement with an adversary which often seeks unilateral gains. U.S. arms control proposals will be consistent with necessary force modernization plans and will seek to achieve balanced, significant, and verifiable reductions to equal levels of comparable armaments. (S)

2. Official Dialogue: The U.S. should insist that Moscow address the full range of U.S. concerns about Soviet internal behavior and human rights violations, and should continue to resist Soviet efforts to return to a U.S.-Soviet agenda focused primarily on arms control. U.S.-Soviet diplomatic contacts on regional issues can serve U.S. interests if they are used to keep pressure on Moscow for responsible behavior. Such contacts can

~~SECRET~~ SENSITIVE

~~UNCLASSIFIED~~

15 Jul 12 copies

~~SECRET~~ SENSITIVE

UNCLASSIFIED

6

also be useful in driving home to Moscow that the costs of irresponsibility are high, and that the U.S. is prepared to work for pragmatic solutions of regional problems if Moscow is willing seriously to address U.S. concerns. At the same time, such contacts must be handled with care to avoid offering the Soviet Union a role in regional questions it would not otherwise secure.

A continuing dialogue with the Soviets at Foreign Minister level facilitates necessary diplomatic communication with the Soviet leadership and helps to maintain Allied understanding and support for U.S. approach to East-West relations. A summit between President Reagan and his Soviet counterpart might promise similarly beneficial results. At the same time, unless it were carefully handled a summit could be seen as registering an improvement in U.S.-Soviet relations without the changes in Soviet behavior which we have insisted upon. It could therefore generate unrealistic expectations and further stimulate unilateral Allied initiatives toward Moscow. (S)

A summit would not necessarily involve signature of major new U.S.-Soviet agreements. Any summit meeting should achieve the maximum possible positive impact with U.S. Allies and the American public, while making clear to both audiences that improvement in Soviet-American relations depends on changes in Soviet conduct. A summit without such changes must not be understood to signal such improvement. (S)

3. U.S.-Soviet Cooperative Exchanges: The role of U.S.-Soviet cultural, educational, scientific and other cooperative exchanges should be seen in light of the U.S. intention to maintain a strong ideological component in relations with Moscow. The U.S. should not further dismantle the framework of exchanges; indeed those exchanges which could advance the U.S. objective of promoting positive evolutionary change within the Soviet system should be expanded. At the same time, the U.S. will insist on full reciprocity and encourage its Allies to do so as well. This recognizes that unless the U.S. has an effective official framework for handling exchanges, the Soviets will make separate arrangements with private U.S. sponsors, while denying reciprocal access to the Soviet Union. U.S. policy on exchanges must also take into account the necessity to prevent transfer of sensitive U.S. technology to the Soviet Union. (S)

Priorities in the U.S. Approach: Maximizing Restraining Leverage over Soviet Behavior

The interrelated tasks of containing and reversing Soviet expansion and promoting evolutionary change within the Soviet Union itself cannot be accomplished quickly. The coming 5-10 years will be a period of considerable uncertainty in which the Soviets may test U.S. resolve by continuing the kind of aggressive international behavior which the U.S. finds unacceptable. (S)

~~SECRET~~ SENSITIVE

UNCLASSIFIED

of 16 of 12 copies

~~SECRET~~ SENSITIVE

UNCLASSIFIED

7

The uncertainties will be exacerbated by the fact that the Soviet Union will be engaged in the unpredictable process of political succession to Brezhnev. The U.S. will not seek to adjust its policies to the Soviet internal conflict, but rather try to create incentives (positive and negative) for the new leadership to adopt policies less detrimental to U.S. interests. The U.S. will remain ready for improved U.S.-Soviet relations if the Soviet Union makes significant changes in policies of concern to it: the burden for any further deterioration in relations must fall squarely on Moscow. The U.S. must not yield to pressures to "take the first step." (S)

The existing and projected gap between finite U.S. resources and the level of capabilities needed to implement U.S. strategy makes it essential that the U.S.: (1) establish firm priorities for the use of limited U.S. resources where they will have the greatest restraining impact on the Soviet Union; and (2) mobilize the resources of Allies and friends which are willing to join the U.S. in containing the expansion of Soviet power. (S)

Underlying the full range of U.S. and Western policies must be a strong military capable of action across the entire spectrum of potential conflicts and guided by a well conceived political and military strategy. The heart of U.S. military strategy is to deter attack by the USSR and its allies against the U.S., its Allies, or other important countries, and to defeat such an attack should deterrence fail. Although unilateral U.S. efforts must lead the way in rebuilding Western military strength to counter the Soviet threat, the protection of Western interests will require increased U.S. cooperation with Allied and other states and greater utilization of their resources. This military strategy will be combined with a political strategy attaching high priority to the following objectives:

-- Sustaining steady, long-term growth in U.S. defense spending and capabilities -- both nuclear and conventional. This is the most important way of conveying to the Soviets U.S. resolve and political staying-power.

-- Creating a long-term Western consensus for dealing with the Soviet Union. This will require that the U.S. exercise strong leadership in developing policies to deal with the multifaceted Soviet threat to Western interests. It will require that the U.S. take Allied concerns into account, and also that U.S. Allies take into equal account U.S. concerns. In this connection, and in addition to pushing Allies to spend more on defense, the U.S. must make a serious effort to negotiate arms control agreements consistent with U.S. military strategy and necessary force modernization plans, and should seek to achieve balanced, significant and verifiable reductions to equal levels of comparable armaments. The U.S. must also develop, together with the Allies, a unified Western approach to East-West economic relations, implementing the agreement announced on November 13, 1982.

8

- Maintenance of a strategic relationship with China, and efforts to minimize opportunities for a Sino-Soviet rapprochement.
- Building and sustaining a major ideological/political offensive which, together with other efforts, will be designed to bring about evolutionary change of the Soviet system. This must be a long-term and sophisticated program, given the nature of the Soviet system.
- Effective opposition to Moscow's efforts to consolidate its position in Afghanistan. This will require that the U.S. continue efforts to promote Soviet withdrawal in the context of a negotiated settlement of the conflict. At the same time, the U.S. must keep pressure on Moscow for withdrawal and ensure that Soviet costs on the ground are high.
- Blocking the expansion of Soviet influence in the critical Middle East and Southwest Asia regions. This will require both continued efforts to seek a political solution to the Arab-Israeli conflict and to bolster U.S. relations with moderate states in the region, and a sustained U.S. defense commitment to deter Soviet military encroachments.
- Maintenance of international pressure on Moscow to permit a relaxation of the current repression in Poland and a longer-term increase in diversity and independence throughout Eastern Europe. This will require that the U.S. continue to impose costs on the Soviet Union for its behavior in Poland. It will also require that the U.S. maintain a U.S. policy of differentiation among East European countries.
- Neutralization and reduction of the threat to U.S. national security interests posed by the Soviet-Cuban relationship. This will require that the U.S. use a variety of instruments, including diplomatic efforts and U.S. security and economic assistance. The U.S. must also retain the option of using its military forces to protect vital U.S. security interests against threats which may arise from the Soviet-Cuban connection. (S)

Articulating the U.S. Approach: Sustaining Public and Congressional Support

The policy outlined above is one for the long haul. It is unlikely to yield a rapid breakthrough in bilateral relations with the Soviet Union. In the absence of dramatic near-term victories in the U.S. effort to moderate Soviet behavior, pressure is likely to mount for change in U.S. policy. There will be appeals from important segments of domestic opinion for a more "normal" U.S.-Soviet relationship, particularly in a period of political transition in Moscow. (S)

It is therefore essential that the American people understand and support U.S. policy. This will require that official U.S. statements and actions avoid generating unrealizable expectations for near-term progress in U.S.-Soviet relations. At the same time, the U.S. must demonstrate credibly that its policy is not a blueprint for an open-ended, sterile confrontation with Moscow, but a serious search for a stable and constructive long-term basis for U.S.-Soviet relations. Correspondence with President Bush

GEORGE BUSH

January 16, 1997

Dear Major Cox,

Thank you for your letter of 10 January. I appreciated hearing from you.

Unfortunately, Major, I must respectfully decline your request for a personal interview. Since leaving office, I have received hundreds of like requests, and it simply is not possible for me to grant each one. Thus, in fairness, I decline them all. However, I hope the enclosed information is helpful to you in your research.

Regarding your third paragraph, I know very well that I would never send a message to Saddam Hussein "via a Japanese businessman." You state that copies of such a letter were "later found throughout Iraq." If you find a copy of this letter, I would very much like to see it. I am totally confident it is a fraud.

Regarding my pronunciation of Saddam Hussein's name, frankly, I don't really care how I pronounced it. I expect that my pronunciation did differ from time to time; however, I was not conveying some kind of message.

Thank you for writing, and good luck with your project.

Sincerely,

Major Lee-Volker Cox
USAF
1815 Braddock Road
Montgomery, AL 36106

P.S. In the War College there in Montgomery is Colonel Kim Siniscalchi, USAF. She is a nurse and a leader in her field. I know you would enjoy meeting her; and if you do, please tell her that her former Commander in Chief and Mrs. Bush send a huge *abrazo*.

10000 MEMORIAL DRIVE · HOUSTON, TEXAS 77024

Glossary

Acronyms

CIA	Central Intelligence Agency
CINC	commander-in-chief
COA	course of action
DOD	Department of Defense
DoS	Department of State
ICBM	intercontinental ballistic missile
IOP	instrument of power
MOOTW	military operations other than war
NCA	National Command Authority
NSDD	National Security Decision Directives
NSS	National Security Strategy
PSYOP	psychological operations
ROTC	Reserve Officer Training Corps
SAC	Strategic Air Command
SOF	special operations forces
SPG	special planning group
STRATCOM	United States Strategic Command
U.N.	United Nations

Definitions

- black propaganda.** misinformation operations accredited to source other than the originating organization.
- black PSYOP.** PSYOP based on nonfactual information, lies and fabrications.
- CINC.** commander-in-chief. Although the U.S. President is considered the commander-in-chief of American forces, references to CINC in this paper imply the combatant commander.
- coercive PSYOP.** efforts undertaken to convince a target audience to reverse a previous position or decision.
- covert.** operations not conducted in the open, clandestine.
- deception.** activities undertaken to purposely mislead a target audience
- deterrent PSYOP.** activities undertaken to prevent a given course of action that may or may not have been the target audience's most beneficial option.
- gray propaganda.** factual or misinformation operations from unidentified source.
- gray PSYOP.** PSYOP based on exaggerations or half-truths
- incentive PSYOP.** positive actions or inducements offered to a target audience to select a course of action that benefits the sender's interests.
- information warfare.** action to deny, exploit, corrupt, or destroy an adversary's information and its functions and protecting against similar activities.
- intercontinental ballistic missile.** Large surface-to-surface nuclear capable ballistic missile with a range in excess of 5,000 miles.
- interagency.** Relationship between governmental organizations.
- military operations other than war.** Use of military capabilities across the range of military operations short of war.
- national military strategy.** Strategy of how best to employ military capabilities to achieve national goals.
- National Security Decision Directives.** President Ronald Reagan's authoritative orders on policies he felt were critical to U.S. security and interests.
- National Security Strategy.** The overarching presidential strategy of integrating IOPs for achieving U.S. objectives and supporting national interests.
- operational military PSYOP.** activities conducted in a geographic area prior to, during, and after conflict in support of a commander's plans.
- operational PSYOP.** regionally focused activities undertaken to influence foreign attitudes, perceptions, and behavior in support of the sender's objectives.
- overt.** activities taken in the open
- psychological operations.** actions taken to create an observable phenomena that influences the target audience's decision making process.
- PSYOP.** see psychological operations
- public diplomacy.** activities undertaken to influence *foreign and domestic* attitudes, perceptions, and behavior in support of the sender's objectives.
- show of force.** Military operation designed to demonstrate resolve, which involves increased visibility of deployed forces.
- Scud.** Short range mobile surface ballistic missile originally developed in the USSR but exported and modified by numerous other countries including Iraq.

special operations forces. Military units organized to perform unconventional missions in hostile, denied, or politically sensitive areas.

Special Planning Group. established by NSDD 77 for the overall planning, direction, coordination, implementation and monitoring of public diplomacy activities. No longer in existence.

strategic PSYOP. activities undertaken to influence *foreign* attitudes, perceptions, and behavior in support of the sender's objectives.

tactical military PSYOP. activities conducted in support of a tactical commander during conflict. Radio, television, and loudspeaker broadcasts and leaflets are the most common activities.

tactical PSYOP. locally focused activities undertaken to influence *foreign* attitudes, perceptions, and behavior in support of the sender's objectives.

TASS. Soviet news agency.

United States Strategic Command. Unified military command responsible for deterring a major military attack against the United States and its allies and if necessary employing forces. USSTRATCOM has at its disposal for planning purposes ICBMs, ballistic missile submarines, strategic bombers and reconnaissance assets.

weapons of mass destruction. nuclear, chemical, or biological weapons.

white propaganda. factual information accredited to originating organization.

white PSYOP. PSYOP based on factual information.

ACKNOWLEDGMENTS

I would like to thank Professor Heather Gregg and Professor John Arquilla for their professionalism, encouragement, and patience during the writing of this thesis. Their guidance throughout the process kept me on the right track and brought me back if I veered off. I am a better researcher and writer because of these two professors.

More importantly, I would like to thank my wife, Joy, sons, Jaxon and Liam, and daughters, Scarlet and Finley, for their support while writing this thesis. Without their love, understanding, and patience, this thesis may never have been possible.

THIS PAGE INTENTIONALLY LEFT BLANK

I. INTRODUCTION

Psychological Operations (PSYOP) have been used, to some extent, in almost every type of conflict since biblical times. During times of war and times of peace, it is directed toward the behavior of a target audience (TA), in order to influence their emotions, motives, and objective reasoning in support of the accomplishment of national aims and objectives.¹ During war, tactical PSYOP is used to lower enemies' will to fight and ultimately lead them to surrender. The importance of PSYOP can be seen in its elevated use throughout the 20th and into the 21st century. Beginning in World War I, the United States has tasked a number of organizations to conduct PSYOP, including the Propaganda Sub-Section, established in 1918, the Office of War Information (OWI), created in 1942, the Office of the Chief of Psychological Warfare (OCPW), established in 1951, and since 1967, the 4th Psychological Operations Group (POG).

In its use of PSYOP, the United States has learned that, in order to influence the behavior of a target audience, one must properly plan the operation in order for it to be successful. However, more than just planning is required in order for PSYOP to be successful; it is also important to consider the best medium for sending the message, the receptiveness of the target audience, and the creation of metrics to evaluate the success of the operation. Literature on communications theory is particularly useful for understanding the necessary conditions that make planning and executing PSYOP successful. In this thesis, I will conduct research on communication theory and Psychological Operations, in particular its use during the Korean War, in an attempt to better understand what makes for successful psychological operations. The aim of this research is to help inform the planning process of future operations in order to execute successful PSYOP.

¹ William E. Daugherty and Morris Janowitz, *A Psychological Warfare Casebook* (Baltimore: Johns Hopkins University, 1958), 2.

A. BACKGROUND

A considerable body of literature has been written over the last seventy years that describes cases of PSYOP and communication theory. There are a number of books and reports written on PSYOP during the Korean War, the first great Cold War conflict, and one in which PSYOP were prominently featured. Stephen Pease, George Pettee, Stanley Sandler, Herbert Friedman, and Alfred Paddock provide the information needed to describe who was responsible for the planning and execution of PSYOP, how it was employed, and the effects it had on the target audience during the Korean War. However, these authors do not focus sufficiently on the importance of PSYOP messaging and how it relates to the successfulness or unsuccessfulness of an operation.²

Communication theory literature offers a great deal of information on what makes for successful communication. Communication models by Harold Lasswell, Claude Shannon and Warren Weaver, Wilbur Schramm, and David Berlo provide the foundation for the PSYOP model that will be introduced in this thesis, in particular, the importance of the source, message, medium, and receiver.³ However, surprisingly little has been written that identifies the practical use of communication models in PSYOP planning. For example, Philip Katz gives a comprehensive detail of communication theory and how it relates to PSYOP but does not identify a way to use communication models in PSYOP

planning.⁴ This thesis aims to address these shortcomings by creating a model and matrix, using the PSYOP messaging variables, to evaluate PSYOP planning and operations.

Specifically, this thesis argues that, in order to understand what causes PSYOP to be successful or unsuccessful one must look at the source's in-depth knowledge of the TA, the message being sent, the medium that is used to send the message, and the receptivity of the TA.⁵ These variables, drawn from communications theory, are necessary for PSYOP to be successful, but to what degree? Is one of these variables more important than another for successful PSYOP? Do all four variables have to be strong or can one or more variables be weak and still achieve the desired effects of the operation? This thesis aims to investigate these questions in order to better understand successful planning and execution of PSYOP operations.

B. METHODOLOGY

Building from literature on PSYOP and communication theory, this thesis begins by defining what PSYOP is and identifies four variables that are necessary for successful PSYOP messaging: in-depth knowledge of the target audience, a clear message, the correct medium, and the receptiveness of the target audience. These four variables make up a PSYOP model and matrix which will be used to evaluate U.S. PSYOP operations during the Korean War, in particular Operation MOOLAH, which aimed to encourage the defection of a MiG-15 fighter pilot with his aircraft, and the U.S. military's use of leaflets and loudspeakers to spread PSYOP messages during the war.

The Korean War is an ideal case to test the PSYOP model and matrix for several reasons. First, there is an abundance of literature written, not only on the Korean War, but also on the use of PSYOP throughout the conflict. Second, since the Korean War took

⁴ See "PSYOP and Communication Theory" by Philip Katz, taken from *The Art and Science of Psychological Operations: Case Studies of Military Application* (Washington: American Institute for Research, 1976), 20–39.

⁵ Although there are a number of variables present during PSYOP, the four that have been chosen coincide with the variables within communication theory. These variables are identified in communication theory and make communication successful.

place over fifty years ago, there has been enough time to evaluate the effectiveness of the PSYOP that took place. Also, documents that were otherwise secret have been made available for study. Third, according to Arend Lijphart, a single case study such as the Korean conflict is a valid and important means of testing theories. “The great advantage of the case study is that by focusing on a single case, that case can be intensively examined...Indirectly, however, case studies can make an important contribution to the establishment of general propositions and thus to theory-building.”⁶

The thesis proceeds as follows: Chapter II offers a definition of PSYOP, drawn from U.S. Army manuals, and offers a brief overview of PSYOP’s history, particularly since World War I. Chapter III uses communication theory to develop a PSYOP model and matrix, arguing that four variables are particularly important for understanding the success of PSYOP products: in-depth knowledge of the target audience, the clarity of the message, the medium used to send the message, and the receptiveness of the TA to the message. Chapter IV uses the PSYOP model and matrix to evaluate U.S. PSYOP during the Korean War, specifically Operation MOOLAH and the use of leaflets and loudspeakers. Chapter V will draw general conclusions and their implications for PSYOP today.

II. WHAT IS PSYOP?

From the time they were founded in 1775 and 1776, the United States Army and the government of the United States have used many forms of media to send well-crafted and sometimes not-so-well crafted messages to populations around the world. These messages were intended to persuade, influence, and/or change the behavior of populations or target audiences in favor of U.S. objectives. Crafted during times of war and during times of peace, these messages have been the backbone of U.S. strategic communications, public diplomacy, and psychological operations. Strategic communications and public diplomacy have been used extensively to inform foreign populations about the United States, and Psychological Operations have been used extensively during wartime to lower the morale of enemy combatants.

This chapter offers a brief history of Psychological Operations, including its definition, how PSYOP messaging is developed, the roles it plays in U.S. military operations and in support of embassy activities, and its evolution since World War I.

A. DEFINING PSYOP

Psychological Operations (PSYOP)⁷ is the term that has been used the longest to describe how the U.S. Army uses selected media to send messages and influence target audiences. PSYOP has outlived the terms “propaganda” and “psychological warfare” (PSYWAR) by more than twenty years each. Just as the term PSYOP has changed over the years, which will be discussed later in this chapter, the definition has also changed. Broadly defined, PSYOP is the actions taken by an organization to decrease an enemy’s morale and efficiency, lower their will to fight, and ultimately cause them to surrender. In order to disseminate the selected information, the organization develops a product or message, which can be audio, visual, or combination of both, and decides on the appropriate media that will have maximum effect in reaching the target audience.

⁷ Most recently, the U.S. Army has proposed changing the name of PSYOP to Military Information Support Operations (MISO). While the new term is still being debated, this thesis will continue to use the term PSYOP.

In the United States Army, the organization that conducts PSYOP is the 4th Psychological Operations Group (POG). The units within the 4th POG conduct PSYOP across the range of military operations and, according to Field Manual 3-05.301, [PSYOP] are the “planned operations to convey selected information and indicators to foreign audiences to influence their emotions, motives, objective reasoning, and ultimately the behavior of foreign governments, organizations, groups, and individuals. The purpose of Psychological Operations is to induce or reinforce foreign attitudes and behavior favorable to the originator’s objectives.”⁸ In order to influence foreign TAs, PSYOP is employed across all instruments of national power to include diplomatic, information, economic measures, and military operations.

PSYOP is used to amplify the effects of military operations. Used during offensive and defensive operations, PSYOP is employed to hasten the eventual defeat of enemy forces through a number of ways, including undermining the will of the enemy to resist and, undercutting the credibility of enemy leadership, increasing unrest among the civilian population in enemy areas, fostering desertion or surrender of enemy forces, reducing civilian interference with military operations, increasing acceptance of friendly forces in occupied territory, and countering enemy propaganda.⁹ Also used during stability operations, PSYOP supports counterterrorism, noncombatant evacuation operations, foreign internal defense, unconventional warfare, and humanitarian assistance.

Current military doctrine calls for a seven-phase PSYOP process. “The seven-phase PSYOP process is a standardized, nonlinear framework by which PSYOP are planned and conducted in support of a broad range of missions.”¹⁰ Phase I, or planning, is where the Psychological Operations objectives (PO), supporting Psychological Operations objectives, potential target audiences, initial assessment criteria, and baseline

⁸ Headquarters, Department of the Army, *Field Manual 3-05.301: Psychological Operations Process Tactics, Techniques, and Procedures*, August 2007, Glossary-8.

⁹ Headquarters, Department of the Army, *Field Manual 3-05.30: Psychological Operations*, April 2005, 2-3.

¹⁰ Headquarters, Department of the Army, *Field Manual 3-05.301: Psychological Operations Process Tactics, Techniques, and Procedures*, August 2007, viii.

data are identified. The PO is “a general statement of measurable response that reflects the desired behavioral change of foreign TAs... [a Supporting Psychological Operations Objective] SPO is the specific behavioral response desired from the target audience to accomplish a given PO.”¹¹ In order to accomplish the PO, two or more supporting PSYOP objectives are needed.

Phase II, or target audience analysis, is where “the PSYOP arguments used (the overall argument and approach to obtain the desired behavior from the TA) and recommended actions that the U.S. military and its allies can take to influence the behavior of selected foreign audiences”¹² are identified. Also during this phase, the medium that will be used to carry the message to the TA will be identified. PSYOP planners use the best medium to disseminate the message to the TA. There are a number of mediums that are identified that have the capability to disseminate or communicate the message, including face-to-face communication, broadcast communication such as radio and television, print material such as newspaper, handbills, leaflets, and posters, and digital dissemination such as the Internet.

Phase III, or series development, is where a “complex, creative, and collaborative process that creates synergy between multiple products and actions to achieve the desired behavior change for a single target audience”¹³ takes place. Series development is the bringing together of a number of products or messages that will aid in the accomplishment of a single SPO. It usually takes more than one product or message to change the behavior of a single TA.

Phase IV, or product development and design, is when the product/action worksheet is created using information from phases I through III. The worksheet “is a source document and conceptual tool for creating products [messages] and providing guidance for pretest and posttest questionnaires.”¹⁴

¹¹ Headquarters, Department of the Army, *Field Manual 3-05.301: Psychological Operations Process Tactics, Techniques, and Procedures*, August 2007, 1-26–1-27.

¹² Ibid., 2-1.

¹³ Ibid., 3-1.

¹⁴ Ibid., 4-1.

Phase V, or approval, is where the PSYOP series goes through an internal review board, after pretesting and appropriate changes are made to the products, and then “staffed out for review and signature by the official approval authority.”¹⁵

After approval is granted, Phase VI begins. Phase VI, or production, distribution, and dissemination is where the products [messages] are mass produced, moved to the dissemination point, and then is disseminated, which is “the actual delivery of the PSYOP message to the TA.”¹⁶

Post-testing of products also takes place during this phase, which “helps the PSYOP Soldiers determine which products in the series are reaching the TA, what portions of the PSYOP argument are resonating with the TA, and what degree of influence the PSYOP series has on the TA.”¹⁷ With the information obtained during post testing, products can be modified or dropped from the series if they are not achieving the desired effects on the TA.

Phase VII, or evaluation, is the “process for evaluating [the] achievement of [the] SPOs and assessing the overall impact of [the] PSYOP series on [the] TA behavior.”¹⁸ PSYOP evaluation is achieved through the monitoring of impact indicators, which answer the assessment criteria questions. “PSYOP assessment criteria are the objective measures used to monitor and assess changes in TA behavior over time...impact indicators are specific, measureable, and observable behavior performed by the TA...analysis of the impact indicators over time will show behavior trends, which determine whether the SPOs are being achieved.”¹⁹

In addition to its military mission, PSYOP provides support to ambassadors and country teams in order to reinforce diplomatic efforts through a number of operations including counterdrug operations, humanitarian mine action, and peace building. United

¹⁹ *Ibid.*, 7-2.

States government information efforts are supported by PSYOP under the auspice of military support to public diplomacy (MSPD).²⁰ Since foreign audiences are often targeted by specific information, PSYOP has been used more frequently by the U.S. government. For example, PSYOP can be used to support economic measures in the establishment of an exclusion zone. Exclusion zones can be established in the air (no-fly zone), sea (maritime), or on land to prohibit specified activities in a specific geographic area.²¹ PSYOP can be used to inform and influence the target audience to act or not act within that zone. Historically, most of the information written about PSYOP is about PSYOP in support of military operations.

B. CRAFTING THE PSYOP MESSAGE

PSYOP messaging consists of four variables: in-depth knowledge of the TA, the message, the medium and the receptiveness of the TA.

The first variable present is the in-depth knowledge of the TA. Studying the enemy before and during conflict gives the PSYOP planner the necessary knowledge to properly employ PSYOP against it. Learning everything they can about the culture, attitudes, emotions, values, and ethics gives valuable insights as to why the TA behaves the way it does. In order to change the behavior of the TA, one must understand why the TA behaves the way it does. An in-depth knowledge of the TA allows the PSYOP planner the ability to understand the behavior and what they need to do to change it.

Initial research on the area of operation which the TA is in should have already been conducted. “PSYOP [planners] should keep abreast of current events and study the history, culture, society, and political makeup of their respective target countries or regions to increase their awareness of long-standing and emerging PSYOP-relevant issues.”²² This initial research allows the PSYOP planner to have a base knowledge of the TA and its surroundings. To build on this base knowledge, the PSYOP planner

²⁰ Headquarters, Department of the Army, *Field Manual 3-05.30: Psychological Operations*, April 2005, 2-2.

²¹ *Ibid.*, 2-5.

²² Headquarters, Department of the Army, *Field Manual 3-05.301: Psychological Operations Process Tactics, Techniques, and Procedures*, August 2007, 2-1.

conducts in-depth research on the TA during Phase II, Target Audience Analysis. Researching PSYOP-specific intelligence, open source information, supported unit documentation, finished intelligence products, and special PSYOP studies and assessments by the Strategic Studies Detachment (SSD) allows the PSYOP planner to identify the conditions, vulnerabilities, susceptibility, and accessibility of the TA which will allow them to effectively target the required behavioral change.²³ The PSYOP planner will also identify any differences in meaning between the TA's and planner's language. The differences of meanings in languages, called semantics, can cause the TA to misunderstand the PSYOP message. If the TA misunderstands the PSYOP message, then there is a possibility that the message will not achieve the desired behavioral change that it was intended to do.

The second variable present is the message. Crafting a message is a difficult task and current doctrine does not give enough guidance on how to craft a message. Field Manual 3-05.301, dated 2007, gives step-by-step instructions on how to develop the PSYOP argument, supporting argument, appeal, techniques, and primary influence tactics that will be directed towards the TA. The field manual states, "the main argument is the reason that the TA should engage in the desired behavior...the supporting arguments are used to provide factual evidence, address causes and effects, and exploit vulnerabilities...an appeal is the overall approach used to present the main argument...techniques refer to the specific methods used to present information to the TA... [and] primary influence tactics will magnify the persuasiveness of PSYOP products and actions."²⁴ The field manual, however, does not explain how to link them together and develop the appropriate message. However, it does state that the PSYOP argument "is not a slogan or tagline and does not provide the specific message or wording for individual product development, which is conducted in Phase IV."²⁵

²³ Headquarters, Department of the Army, *Field Manual 3-05.301: Psychological Operations Process Tactics, Techniques, and Procedures*, August 2007, 2-1.

²⁴ Ibid., 2-23, 2-27.

²⁵ Ibid., 2-24.

The word “message” is used sixty-seven times throughout Phase IV, but nowhere in the field manual does it explain how to craft the message. It does cover how and where the message should be inserted or displayed on the product that is being disseminated, whether it is audio, visual, or a combination of both. Dealing with print products, the most useful information on messages that Phase IV provides is “factors contributing to effective message writing include the following: a good practical knowledge of the TA language, recent residence in the target location and familiarity with current happenings in that area, familiarity with the organization of the TA’s leadership, equipment, and arms, familiarity with the civilian population and the political, sociological, economic and psychological environment, and access to personnel with experience in advertising, journalism, public relations, or marketing.”²⁶

Field Manual 33-1-1, dated 1994, gives better instructions on how to craft a message. The field manual states, “PSYOP messages come in many forms...whatever the kind of message, however, they have a common characteristic—they ultimately have the same kind of purpose and the same need to be attended, understood, accepted, and acted upon.”²⁷ Appendix J of the same manual goes on to explain, “the copy text is the written message...it contains a detailed discussion of the appeal being made, supporting and justifying it. A good text convinces the reader that only by accepting the course of action stated or implied in the text can his needs be fulfilled. The text must contain terms, phrases, and vernacular familiar to the target audience.”²⁸ Just as with print products, current doctrine has left out key information that the PSYOP planner needs to write a message inside a script for an audio product, such as a loudspeaker or radio broadcast. FM 33-1-1 addresses these issues by listing a number of principles and factors that the PSYOP planner should follow in order to properly script a message that would be used in radio and loudspeaker operations.

²⁶ Headquarters, Department of the Army, *Field Manual 3-05.301: Psychological Operations Process Tactics, Techniques, and Procedures*, August 2007, 4–17.

²⁷ Headquarters, Department of the Army, *Field Manual 33-1-1: Psychological Operations Techniques and Procedures*, May 1994, 7-3.

²⁸ *Ibid.*, J-2.

The third variable is the medium. During Phase II, the best medium is selected, and during Step Six, determining accessibility, the “PSYOP Soldiers determine which media can reach the TA and to what degree the TA can be influenced by each media type.”²⁹ There are a number of tasks that the PSYOP planner completes in order to choose the best medium. These tasks include:

deciding how the TA currently receives information, deciphering current media patterns and usage, determining how the TA uses the medium, discovering how involved the TA is in the process, understanding whether the TA assesses the media individually or with others, debating what new media can be used to access the TA, including all of the information on the target audience analysis worksheet (TAAW), and articulating the technical aspects of each media. Once these tasks are complete, they will help answer the question, ‘What types of media will effectively carry [the] PSYOP [message] to the TA?’³⁰

The fourth variable is receptiveness of the TA. Current doctrine discusses susceptibility of the TA but fails to address TA receptiveness. During phase II of the seven-phase PSYOP process, the PSYOP planner implements the Target Audience Analysis Model (TAAM). The TAAM “is a practical research and analysis method that yields the necessary information for developing PSYOP products and actions.”³¹ Determining TA receptiveness is not identified in any of the seven steps. If the TA is receptive, then they are ready or willing to receive favorably or open to arguments, ideas, or change. For the TA to be influenced by the PSYOP message, they first need to be receptive of the message.

C. EVOLUTION OF PSYOP

Since World War I, the act of using media to send a message to a target audience has evolved through a number of names and definitions, and by those who practice it. “Propaganda” was the first term that people on all sides of the war used, meaning any

²⁹ Headquarters, Department of the Army, *Field Manual 3-05.301: Psychological Operations Process Tactics, Techniques, and Procedures*, August 2007, 2-21.

³⁰ *Ibid.*, 2-21.

³¹ Headquarters, Department of the Army, *Field Manual 3-05.301: Psychological Operations Process Tactics, Techniques, and Procedures*, August 2007, 2-3.

form of communication which affected the minds, emotions, and actions of a particular group.³² Military propaganda, defined by Paul Linebarger as “the planned use of any form of communication designed to affect the minds and emotions of a given enemy, neutral or friendly foreign group for a specific strategic or tactical purpose,”³³ was used extensively by all sides during the war. In the United States, several agencies were responsible for the employment of propaganda throughout the First World War, which included the Committee on Public Information (CPI), better known as the “Creel Committee” and the military Propaganda Section inside the General Headquarters, American Expeditionary Forces.³⁴

After World War I, the United States lost most of its interest in the use of propaganda because many believed that its employment was not necessary in a peace times. The Army disbanded both the CPI and the military Propaganda Section and almost all of the experiences and lessons learned during the war were lost over the next twenty years. In 1920, J.F.C. Fuller analyzed the lessons learned from the employment of new weapons in the war. He prophesied that, in the future, traditional warfare fought on the battlefield would be replaced by a “purely psychological warfare.”³⁵ The term psychological warfare (PSYWAR) would come into play when the United States went to war against Germany and Japan during the Second World War (WWII). This change, from propaganda to PSYWAR, was the result of a translated German document that claimed “psychology should be employed in all phases of combat.”³⁶ However, during this time, both propaganda and PSYWAR were used interchangeably.

Just as in WWI, when WWII broke out the United States did not have a unit dedicated to conducting PSYWAR. President Franklin D. Roosevelt attempted to correct

³⁶ Alfred H. Paddock, “Legitimizing Army Psychological Operations,” *Joint Forces Quarterly* 56 (1st quarter 2010): 90.

the problem by appointing Colonel William Donavon as the Coordinator of Information (COI) in 1941. Over the next four years, the control of PSYWAR would be wrestled between a number of civilian and military agencies. The COI, later renamed the Office of Strategic Studies (OSS), disbanded the Psychological Warfare Branch (PWB) within the Military Intelligence Service at the end of 1942; ten months later, the PWB was resurrected as the Propaganda Branch within the Military Intelligence Division (G-2). The Office of War Information (OWI), and a number of other agencies fought back and forth for the rights to conduct PSYWAR throughout WWII.³⁷ In 1944, the Psychological Warfare Branch was established in General MacArthur's Southwest Pacific Area Command and the Psychological Warfare Division was established in General Eisenhower's Supreme Headquarters, Allied Expeditionary Force.³⁸ It was not until 1945 that all the agencies involved would finally be integrated in some way or another to practice PSYWAR. Military historian Stanly Sandler argues:

The military relationship had been clarified. The new [Propaganda Branch] undertook no operations whatever, but connected War Department with OWI and OSS for policy and liaison...military needs in psychological warfare had been settled by regarding the Theaters in this respect as autonomous, and leaving to the respective Theater Commanders the definition of their relationships with OWI and OSS, and their use of each.³⁹

Throughout World War II, PSYWAR had a difficult time in establishing itself within an appropriate agency, either civilian or military. The military finally decided to place the capabilities of PSYWAR within the newly established Propaganda Branch in the G-2. Although short lived (only four years) the Propaganda Branch was finally taken out of the G-2 branch in 1946 and, in early 1947, moved to Plans and Operations under the G-3. During this same period, Major General M.S. Eddy, who was the chief of

information, raised concerns over the term psychological warfare and that it would have to be carefully defined “so as not to arouse public indignation or fear of ‘gestapo-ism’ and authoritarianism in our own country.”⁴⁰ Military historian Paul Paddock argues:

Director of Plans and Operations was overall responsible for the general supervision of Army psychological warfare activities...[but] several War Department agencies were given pieces of the pie... Real centralization of psychological warfare activities did not occur until January 1951 with the formation of the Office of the Chief of Psychological Warfare (OCPW), headed by General McClure.⁴¹

According to OCPW’s mission, “it was to formulate and develop psychological and special operations plan for the Army.”⁴² One of the major divisions that McClure organized his office into was Psychological Operations. The name of the division would later help in transitioning the term PSYWAR to Psychological Operations (PSYOP) in the 1960s.

When North Korea attacked South Korea in the summer of 1950, the only active duty unit that focused on PSYWAR was a small Army detachment based at Fort Riley, Kansas. This detachment, later designated as the 1st Loudspeaker and Leaflet (L&L) Company, was sent to Korea in the fall of 1950. Once again, interest in PSYWAR increased within the U.S. government and the Army in response to this new conflict. In 1951, with the need for increased PSYWAR capabilities, the 1st Radio Broadcasting and Leaflet (RB&L) Group was organized and sent to Korea to help support strategic propaganda activities. Throughout the war, the 1st L&L Company conducted PSYWAR using mobile loudspeakers and the 1st RB&L group conducted PSYWAR using print media and radio stations. Even though PSYWAR capabilities increased during the war, once again, at the end of the war and over the next ten years, these capabilities were greatly degraded. Despite this, General McClure was able to establish the Psychological Warfare Center at Fort Bragg, North Carolina, in May 1952, which is most likely why

⁴⁰ Alfred H. Paddock, *U.S. Army Special Warfare: Its Origins* (Kansas: University Press of Kansas, 2002), 48.

⁴¹ *Ibid.*, 45.

⁴² *Ibid.*, 95.

PSYWAR capabilities did not disappear altogether. Because the Warfare Center trained both PSYWAR and Special Forces units, the name was later changed to the Special Warfare Center in 1956.

In early 1960, the term that represented the act of sending messages using various types of media changed once again. According to Paddock,

Psychological operations replaced psychological warfare...Psychological operations, or PSYOP, encompassed psychological warfare, but the latter indicated propaganda directed only against enemy forces and populations for divisive purposes. The new and broader term could also be used to describe propaganda employed toward friendly and neutral audiences for cohesive purposes.⁴³

Recognizing the need for PSYOP capabilities in Vietnam, the 6th PSYOP Battalion was activated in country in 1965. Two years later, the size of U.S. Army PSYOP had increased to a group, identified as the 4th PSYOP Group, which consisted of four PSYOP battalions. Once again, having limited and degraded PSYOP capabilities before the war started, the Army spent time during the war to build up and employ the capabilities that were needed. By the end of the war in Vietnam, the U.S. Army had a robust PSYOP capability able to conduct PSYOP at the tactical and strategic levels. This all changed after the war as the U.S. government began to draw down the military. By 1974, the only active duty unit that was capable of conducting effective PSYOP was the 4th PSYOP Group at Fort Bragg, but it was understaffed and poorly equipped. The term “psychological operations” took hold during this period and would be used for the next 30 years.

From 1974 to the mid-1980s, PSYOP forces managed to survive at Fort Bragg. In the mid to late 1980s, PSYOP forces were increased in size and the equipment that they used was modernized. This was the first time such actions took place when the U.S. was not at war. New interests in PSYOP began to rise and, according to Colonel Curtis Boyd, there were a number of things that helped in the growth of PSYOP. Colonel Boyd states,

⁴³ Alfred H. Paddock, “Legitimizing Army Psychological Operations,” *Joint Forces Quarterly* 56 (1st quarter 2010): 91.

The impact of President Ronald Reagan's National Security Decision Directive 77 (1983), the Department of Defense PSYOP Master Plan (1985) and the Goldwater-Nichols Act (1987) provided permanent PSYOP staff authorizations within the Joint Staff, the Department of the Army and the U.S. Special Operations Command as well as the permanent establishment of two reserve-component PSYOP Groups, an enlisted military occupational specialty (37F), [and] the recognition of the importance of PSYOP planning at Combat Commands.⁴⁴

During the next 30 years, PSYOP forces were used extensively throughout the world supporting missions that expanded across the spectrum of conflicts.

Operation Enduring Freedom, the War on Terror, and Operation Iraqi Freedom presented new challenges for the PSYOP community. With PSYOP forces constantly being deployed to support these operations, the need to increase the size of the community grew every day. In 2006, the PSYOP Branch was created and an authorization to increase the number of soldiers and officers within the 4th PSYOP was given.

Another challenge to the community in the post-September 11 security world was the term PSYOP. Since the origins of PSYOP came from a long history of misunderstandings and name changes, individuals in the government and the Army saw the need to hide what they were doing by calling it different names. Military Support to Public Diplomacy, International Public Diplomacy, and even Information Operations have been used to soften the reputation that the term PSYOP gives.⁴⁵ After years of mistrust, misunderstandings, and misuse, a new "softer" term was needed to cover all that PSYOP does and to help employ PSYOP not only in the tactical and strategic area, but also in the political realm. Military Information Support Operations, or MISO, took the place of PSYOP in 2010 and transition to this new term began in 2011. For the purpose of this thesis, the term Psychological Operations will be used because it is well known and has a longer history than Military Information Support Operations.

⁴⁴ Colonel Curtis Boyd, "The Future of MISO," *Special Warfare* 24 (2010): 24.

⁴⁵ Colonel Curtis Boyd, "The Future of MISO," *Special Warfare* 24 (2010): 25.

D. FUTURE

Currently, the state of PSYOP is in flux. Doctrine is being rewritten to cover how to plan and execute PSYOP effectively, but before this can be done, the PSYOP community must learn what makes for successful PSYOP. The community can learn this by looking into the past and by considering communication theory.

The Korean War is a great case to study to find out how to construct, execute, and measure successful PSYOP because there was a standing unit, although small, that was ready to conduct PSYOP when the war began. Also, PSYOP was conducted by all sides in the war and we have had a long time, over fifty years, to analyze the outcomes. There is a lot of information about loudspeaker operations and leaflet drops that were conducted during the Korean War which can be analyzed to find out what made them successful or unsuccessful. One well known case, Operation Moolah, provides excellent information on the effects, or lack thereof, of a leaflet drop that offered a reward for a North Korean pilot to defect with a Soviet MIG.

Even though the name of PSYOP has changed over the last one hundred years and the job to plan and execute PSYOP has moved from one organization to another, the “act” has always stayed the same—sending messages using various types of media to change the behavior of a targeted audience. The next chapter will use communication theory to analyze the process in which a sender sends a message to a receiver. In this case, the sender is the PSYOP organization, the message is the PSYOP message intended to change the behavior of the TA, and the receiver is the TA.

III. COMMUNICATION THEORY

Measuring PSYOP effectiveness has always been a difficult task. Military historian Stephen E. Pease argues, “Judging the effectiveness of a PSYWAR operation is almost impossible...There usually is no immediate and observable link between the cause (the PSYWAR) and effect.”⁴⁶ Most of the information on PSYOP’s use during conflict has focuses on measures of performance (MOP) rather than measures of effectiveness (MOE). MOP such as the number of leaflets dropped, the number of hours of radio broadcasts are made, and the amount of money spent on operations are almost always reported. Rarely is the actual effectiveness of these leaflets, radio broadcasts, and money spent reported in an appropriate time to measure the success of the PSYOP operation. The tendency to report MOP and not MOE is the result of a number of factors. First, commanders typically want to know the immediate results of PSYOP. The problem with this demand is that almost all PSYOP aims to change the behavior of a TA, which takes time. There are a few instances where the effectiveness of PSYOP can be measured fairly quickly, such as a surrender appeal to enemy troops. Effectiveness can be easily measured by the number of enemy surrenders. However, immediate results are the exception, not the norm in PSYOP. Second, in order to prove that they are participating in the operation, PSYOP planners usually report MOP. Because measuring the effects of the PSYOP product takes time and commanders want results now, MOP is easily substituted in place of MOE to give the commander something.

To alleviate the temptation of substituting MOP with MOE, PSYOP planners need to provide the commander with a pre-measurement of the effectiveness of the PSYOP product that will be deployed. This premeasurement can be achieved by using a Communication Theory model in the seven-phase PSYOP process. As an evaluation tool, the model can provide the PSYOP planner with insights on what makes for successful PSYOP. The model can also be used as a lens for analyzing PSYOP that has already been conducted to find out what made the PSYOP successful or unsuccessful.

⁴⁶ Stephen E. Pease, *PSYWAR: Psychological Warfare in Korea, 1950-1953* (Harrisburg: Stackpole Books, 1992), 12.

This chapter offers a brief history of Communication Theory models. It then builds off of these models to construct a new communication model as an evaluation tool for PSYOP planning. This model will then be used as an analytical tool to evaluate past PSYOP, specifically PSYOP during the Korean War.

A. HISTORY OF COMMUNICATION THEORY MODELS

Communications have been taking place for thousands of years. Just as the interest in PSYOP increased over the last century, interest in how and why individuals communicate has too. The interest in communication has allowed individuals to create a number of models which describe how communication takes place. At its simplest form, a communication model has three elements: the sender, a message, and the receiver. Throughout the 20th century, political scientists, mathematicians, and communications theorists helped developed the communication models that we use today. Prior to the 20th century, one of the first individuals who discussed the importance of communication was Aristotle. Aristotle, writing in 350 B.C.E., defined the study of communication as “rhetoric” and described three parts that make up the process of communication. He explained, “Rhetoric falls into three divisions, determined by the three classes of listeners to speeches. For of the three elements in speech-making—speaker, subject, and person addressed—it is the last one, the hearer, that determines the speeches end and object.”⁴⁷ During his time, Aristotle already recognized the importance of the target audience while communicating. Aristotle’s definition can be described as the first communications model in which the speaker is the sender, the subject is the message, and the person addressed is the receiver.

Throughout the 20th century, with the increase of interest in communications, a number of individuals are attributed with laying the foundation of communication theory. A few of these individuals, Harold Lasswell, Claude Shannon and Warren Weaver, Wilbur Schramm, and David K. Berlo, developed fairly simple models that show how communication takes place.

⁴⁷ W. Rhys Roberts (trans), “Rhetorica,” *The Works of Aristotle*, volume XI, ed., W.D. Ross (London: Oxford University Press, 1924), 1348.

Harold D. Lasswell, writing in the first half of the 20th century, developed the model that states, “Who says what in which channel to whom with what effect.”⁴⁸ Lasswell expands on Aristotle’s definition by adding an additional part to his model. This part, the channel, can be described today as the medium. This four part model is still being used today to describe how communication works.

Figure 1. Lasswell Model

In 1948, while working for Bell Telephone Labs, Claude Shannon published a paper titled “A Mathematical Theory of Communication.” In the paper, Shannon describes a communication system as having six parts: source, message, transmitter/encoder, channel, receiver/decoder, and destination.⁴⁹ As a research mathematician, Shannon created this theory in order to help with the information flow over telephone lines. In 1949, Warren Weaver expanded on Shannon’s writing and published a paper titled “Recent Contributions to the Mathematical Theory of Communication.” With the information presented in their two papers, Shannon and Weaver later published a book titled *The Mathematical Theory of Communication*. Both men are credited with what is now identified as the Shannon-Weaver Model of Communication. This model introduces noise into the communication process. Noise, as

⁴⁸ Harold D. Lasswell, “The Structure and Function of Communication in Society,” *The Communication of Ideas*, edited by Lyman Bryson (New York: Institute for Religious and Social Studies, Jewish Theological Seminary of America, 1948), 37.

⁴⁹ C. E. Shannon: “A Mathematical Theory of Communication,” *Bell System Technical Journal*, vol. 27, pp. 379–423 and 623–656, July and October, 1948

Weaver states, “may be distortions of sound (in telephony, for example) or static (in radio), or distortions in shape or shading of picture (television), or errors in transmission (telegraphy or facsimile), etc.”⁵⁰

Figure 2. Shannon-Weaver Model

Wilbur Schramm, a communication theorist, wrote a number of books and articles about communication throughout the 20th century. The contributions that Schramm made in the field of communications were paramount. In “Wilbur Schramm: Portrait of a Development Communication Pioneer,” Arvind Singhal states, “Without Wilbur Schramm, communication science could never have achieved its present status. Perhaps he should be considered a fifth founder of communication research.”⁵¹ In his book *The Process and Effects of Mass Communication*, Schramm introduced a model that had the same elements that Aristotle identified in his definition of Rhetoric, the source or speaker, the message or subject, and the destination or person being addressed. Unlike Aristotle, Schramm identifies that there needs to be something in common between the

⁵⁰ Claude E. Shannon and Warren Weaver, *The Mathematical Theory of Communication*, (Urbana, Ill.: The University of Illinois Press, 1964): 7.

⁵¹ Arvind Singhal, “Wilbur Schramm: Portrait of a Development Communication Pioneer,” *Communicator: Journal of the Indian Institute of Mass Communication*, XXII (1987): 18. Accessed March 19, 2011. <http://utminers.utep.edu/asinghal/Articles%20and%20Chapters/singhal-Wilbur%20Schramm-communicator.pdf>

source and the destination for the communication to be effective. This is identified as the overlapping of the field of experience in Schramm's model.

Figure 3. Schramm Model

In 1960, David K. Berlo, a communication theorist like Wilbur Schramm, introduced a model of communication called the SMCR model. SMCR, which stands for source, message, channel, receiver, includes a number of factors listed under each element that are needed in order for each element to be effective in the communication process.

Figure 4. Berlo Model

B. PSYOP MODEL

For the purpose of this thesis, Berlo's model will be used with elements from the Shannon-Weaver model. Also added are elements from PSYOP doctrine, which will allow easy analysis once the information is identified during the seven-phase PSYOP process. This model can be used to analyze a PSYOP operation to find out if it has the potential to be successful. The model can also be used to analyze past PSYOP operations to find out what made them successful or unsuccessful.

Figure 5. PSYOP Model

C. EVALUATION TOOL

As a very simple evaluation tool, this PSYOP model can be used to analyze the first four phases of the seven-phase PSYOP process to find out if you have the ingredients that make for successful PSYOP. At the end of phase IV, the PSYOP planner has enough information to use the PSYOP model. The source/sender is the PSYOP planner that is executing the seven-phase PSYOP process. The source/sender has to have an in-depth knowledge of the TA and their environment. In order to have an in-depth knowledge of the TA and their environment, the PSYOP planner must conduct a thorough TAA. FM 3-05.301 states, "Accurate and thorough analyses of the TA will yield vital information for the PSYOP Soldier. PSYOP TAA seeks to answer five key questions:

What TAs will be most effective in accomplishing the SPO?

What are the reasons for the TA's current behavior?

What are the best means of communication to reach the TA?

How can the TA be influenced to achieve the desired behavior?

What are the appropriate criteria by which to assess behavior change?"⁵²

The TAAM will provide the information that will be used to develop the PSYOP argument. As stated earlier, the PSYOP argument does not provide the specific message, but it does give you the appropriate information that will allow you to craft (encode) an effective message. An issue the PSYOP planner must be aware of while crafting the PSYOP message is semantic noise. Semantic noise occurs when the PSYOP planner uses phrases, symbols, language dialects, slangs, etc., in the PSYOP message that the TA does not understand. Once the appropriate PSYOP message is crafted, the best medium that was identified during TAA is selected. If the PSYOP planner conducted a thorough TAA, as stated earlier, then the appropriate medium will be identified that will have maximum effects on the TA. If semantic noise was introduced while crafting the message, then the TA will not understand the message when they receive (decode) it from the medium. Once the appropriate message is sent, without semantic noise, to the TA through the appropriate medium, there are two things that the TA has to be in order to receive the message. They have to be receptive and susceptible of the message.

When comparing the model with the information obtained during TAA, the PSYOP planner will insert the required data inside the model. Once inserted, the model will give a visual representation of the communication that will take place between the PSYOP planner (sender) and the TA (receiver). In theory, if the PSYOP planner has the in-depth knowledge of the TA, he/she will be able to craft the appropriate message, without semantic noise, and send it to a receptive and susceptible TA through the appropriate medium, and then the behavior of the TA will be changed.

⁵² Headquarters, Department of the Army, *Field Manual 3-05.301: Psychological Operations Process Tactics, Techniques, and Procedures*, August 2007, 2-3.

D. PSYOP MODEL AS A LENS

The four variables of PSYOP messaging are present in the PSYOP model. As a lens, the PSYOP model can be used against PSYOP operations that have been conducted in the past to evaluate the effectiveness of the operation. The four variables, in-depth knowledge of the TA, message, medium, and receptiveness of the TA can be used to measure the outcome of the operation. By inserting the information obtained from the operation into the PSYOP model and using the matrix below as a checklist, it can be determined what variables are strong or weak and what impact they had on the operation.

	STRONG	WEAK
In-Depth Knowledge of the TA	• In-depth research was conducted before and during conflict • The proper resources were used to acquire the needed knowledge of the TA	• In-depth research was not conducted before or during conflict • The proper resources were not used to acquire the needed knowledge of the TA
MESSAGE	• Clear of semantic noise • TA understands message • The proper conditions, vulnerabilities, legitimate appeals, persuasion techniques, influence tactics are used	• Has semantic noise • TA does not understand message • The proper conditions, vulnerabilities, legitimate appeals, persuasion techniques, influence tactics are not used
MEDIUM	• Reaches a majority of the TA • Has credibility • TA is able to receive the message through the medium (if a leaflet is used with written text, the TA must be able to read)	• Does not reach a majority of the TA • Does not have credibility • TA is not able to receive the message through the medium (if a radio broadcast is used, a majority if not all of the TA have to have a radio)
RECEPTIVENESS OF THE TA	• TA is open to arguments, ideas, or change	• TA is not open to arguments, ideas, or change

Figure 6. PSYOP Matrix

After inserting the information into the model and using the matrix, one will be able to measure the validity of each variable in the hopes of finding out what makes for successful PSYOP. For example, for PSYOP to be successful do all four variables have to be strong or can you have successful PSYOP when one or more variables are weak.

The next chapter will use the PSYOP model and PSYOP matrix as a lens to analyze PSYOP operations during the Korean War. The analysis will focus on one case, Operation Moolah, and two areas where the enemy was targeted for surrender, the use of the safe conduct pass leaflets and the use of loudspeaker surrender appeals.

THIS PAGE INTENTIONALLY LEFT BLANK

IV. KOREAN WAR

This chapter uses the PSYOP model and matrix introduced in chapter three to analyze U.S. Psychological Operations during the 1950–1953 Korean War. In particular, the chapter investigates three operations from the Korean War: Operation Moolah, which aimed to acquire a Russian MiG-15 jet fighter from enemy forces; the use of leaflets that carried the safe conduct pass message; and the use of loudspeakers directed toward enemy forces, which aimed to reduce morale and persuade combatants to surrender.

The Korean War was chosen for several reasons. It was the first time in which there was a standing PSYOP unit ready to deploy when the war started. According to military historian Stephen Pease, “When the North Koreans crossed the 38th parallel in June 1950, the only operational PSYWAR unit was the small twenty-person Tactical Information Detachment at Fort Riley, Kansas. It was expanded and sent to South Korea as the 1st Loudspeaker and Leaflet Company (1st L&L), arriving on 8 November 1950.”⁵³ Also, there was a Psychological Warfare Section, within the Far East Command, that was able to produce and disseminate leaflets within twenty-four hours after President Truman committed U.S. troops to Korea.⁵⁴ By having a PSYWAR section in the Far East Command and a standing unit ready to deploy, the Army did not lose any valuable time in training or planning in PSYWAR for the Korean War. Second, there have been multiple reports and books written on the outcomes of PSYOP conducted during the war. This data provides the necessary information to which the PSYOP model and matrix can be applied to better understand the successes and failures of PSYOP products and methods of messaging during the war. Finally, despite the fact that the PSYOP model and matrix were constructed using current doctrine, it is argued that the matrix and model

⁵³ Stephen E. Pease, *PSYWAR: Psychological Warfare in Korea, 1950–1953* (Harrisburg: Stackpole Books, 1992), 20.

⁵⁴ Stanley Sandler, “*Cease Resistance: It’s Good For You!*”: *A History of U.S. Army Combat Psychological Operations* (Fort Bragg, NC: U.S. Army Special Operations Command Historical Monograph Series No. 9, 1999), 206–207.

are useful tools for analyzing past and present PSYOP products and means of messaging; it is therefore the purpose of this chapter to test the overall utility of the model and matrix.

Overall, analysis based on the PSYOP model and matrix suggests that the four variables identified for PSYOP messaging were not always strong during the three cases investigated. Despite this, successful PSYOP did occur when three of the four were strong. In the use of safe conduct pass leaflets, three strong variables (message, medium, and receptiveness of the TA) and one weak variable (in-depth knowledge of the TA) resulted in successful PSYOP. In another case, Operation Moolah, all four variables were considered weak, causing PSYOP to be unsuccessful, although the operation was considered a success due to secondary effects. In the last case, loudspeaker surrender appeals, two strong variables (message and medium) and two weak variables (in-depth knowledge of the TA and Receptiveness of the TA) accounted for PSYOP to be successful a majority of the time.

A. CASE STUDIES: OPERATION MOOLAH, SAFE CONDUCT PASS LEAFLET, AND LOUDSPEAKER SURRENDER APPEAL

During the Korean conflict, PSYOP planners had to rely on the August 1949 *Field Manual 33-5, Psychological Warfare in Combat Operations* to plan and execute their operations. The main focus of the manual was to lower the morale of enemy forces and to persuade them to surrender or desert. Field Manual 33-5 states: “Psychological warfare consists of activities, other than combat, which communicate ideas and information intended to affect the minds, emotions, and actions of the enemy...for the purpose of reducing the enemy morale and will to fight.”⁵⁵ It further states that, “the basic aim of psychological warfare conducted by a military command is to assist in expediting the defeat of the armed forces of the enemy. It achieves this basic purpose by seeking to: Decrease the combat efficiency of the enemy by lowering the morale of his forces; Induce enemy forces to surrender or desert; [and] Sustain the morale of friendly

⁵⁵ Headquarters, Department of the Army, *Field Manual 33-5: Psychological Warfare in Combat Operations*, August 1949, 2.

elements in enemy areas.”⁵⁶ Therefore, PSYOP operations conducted during the Korean War dealt mainly with lowering of morale and surrendering of enemy forces.

1. Operation Moolah

Operation Moolah was an attempt by U.S. forces in Korea to acquire a Russian MiG-15 jet fighter from enemy forces. The U.S. offered \$100,000 to the first pilot who defected to South Korea with a combat-capable MiG-15.⁵⁷

In the fall of 1950, UN air forces were at a disadvantage when it came to air combat. The Russian MiG-15 jet fighter wreaked havoc in the skies over Korea and the UN did not have fighters that could match the power and speed that the MiG-15 brought to a dogfight. The U.S. military needed to study a fully operational MiG-15, fitted for combat, in order to understand how the MiG-15 was designed, its capabilities, and how to fight effectively against it in the air. The U.S. government also wanted to prove that the Soviet Union was actively contributing to the Korean conflict. The Soviet Union claimed it was neutral; however, UN pilots reported hearing Russian being spoken over their radio frequencies and UN POWs claimed that Soviet pilots interrogated them while in captivity.⁵⁸ The U.S. government, therefore, wanted to prove that the Soviet Union was not only supplying the MiG-15 to North Korean forces, but that it was also providing Soviet pilots to fly the MiG-15 in combat. Ultimately, the operation was aimed at encouraging either a Russian or North Korean pilot to defect with a combat capable MiG-15 jet fighter.

Several stories persist on the origins of the operation, but according to retired SGM Herbert Friedman, Edward Hymoff was the one who came up with the idea of offering \$100,000 to an enemy defector for a combat-ready MiG-15.⁵⁹ In the fall of 1952,

⁵⁶ Headquarters, Department of the Army, *Field Manual 33-5: Psychological Warfare in Combat Operations*, August 1949, 6.

⁵⁷ Stephen E. Pease, *PSYWAR: Psychological Warfare in Korea, 1950–1953* (Harrisburg: Stackpole Books, 1992), 70.

⁵⁸ *Ibid.*, 67.

⁵⁹ Herbert A. Friedman, “OPERATION MOOLAH: The Plot to Steal a MiG-15,” Accessed May 07, 2011. <http://www.psywarrior.com/Moolah.html>.

Hymoff, who was the Bureau Chief of the *International News Service* in Korean, presented the concept of a reward for a MiG-15 to General Mark W. Clark while on a flight to Tokyo.⁶⁰ From there, the idea made its way to Washington and the Pentagon “authorized [General] Clark to offer a reward for a North Korean Air Force jet fighter.”⁶¹

Although many consider Operation Moolah as the “greatest PSYWAR triumph in the Korean War,”⁶² it can be argued that it actually was not a success because it did not achieve its goal—the defection of an enemy pilot with a combat-capable MiG-15. Two months after the armistice was signed, in 1953, a North Korean pilot defected and the United States got its hands on a MiG-15, but this defection happened independent of Operation Moolah. The pilot claimed he did not see any of the leaflets dropped or hear any of the radio broadcasts connected with the operation.

However, despite the inability of Operation Moolah to successfully encourage an enemy defector with his MiG-15, there were important secondary effects that U.S. PSYWAR soldiers observed after the operation began. Pease argues that “The Russian-language broadcasts were blocked by a powerful jammer in North Korea... [And] MIG flights dropped drastically. For eight days, there were no MIG sorties at all, an unprecedented stand down.”⁶³ U.S. troops also noted that, following Operation Moolah, “the quality of the MIG pilots was noticeably poorer after regular sorties resumed...the MIG pilots compiled the worst record of the entire war. UN Sabres downed 165 MIGs to only three losses, a fifty-five-to-one ratio!”⁶⁴ Military Intelligence believed that the Soviet pilots were no longer flying the MiGs and that the “Koreans were only letting the most politically trustworthy pilots fly, which may have kept their best pilots on the

⁶⁴ Ibid., 72–73.

ground,”⁶⁵ In other words, even though Operation Moolah did not succeed in persuading an enemy pilot to defect with a MiG-15 jet fighter, the operation did have an unintended, measurable effect on air operations.

Operation Moolah consisted of radio broadcasts and leaflet drops in the Korean, Chinese, and Russian languages. U.S. forces dropped over a million leaflets over North Korea and radio broadcasts transmitted approved scripts on two separate occasions in April and May 1953.

a. Analysis of Operation Moolah

The PSYOP model produces the following analysis:

1. In-depth knowledge of the TA: The source of the leaflets and radio broadcasts was Headquarters, 1st Radio Broadcasting & Leaflet Group.⁶⁶ The 1st Radio Broadcasting & Leaflet Group arrived in Tokyo in August 1951 to help the Far East Command’s Psychological Warfare Section in its job to wage PSYWAR in Korea. The 1st RB&L Group was largely manned by reserve officers with backgrounds in journalism, newspaper printing, novel and script writing, artwork, and radio technology. Even though the training that these officers received on Korean customs, language, and social details did not provide them with the in-depth knowledge of the TA that they needed, Korean nationals helped the officers in developing and targeting and, within a year, the Group was able to produce leaflets in sixteen languages and dialects.⁶⁷

Two years prior to Operation Moolah, in 1951, George Pettee, a research analysts working in the Operations Research Office at The John Hopkins University, wrote a technical memorandum titled “US PSYWAR Operations in the Korean War,” in which he made the following observation:

⁶⁵ Stephen E. Pease, *PSYWAR: Psychological Warfare in Korea, 1950–1953* (Harrisburg: Stackpole Books, 1992), 73.

⁶⁶ Herbert A. Friedman, “OPERATION MOOLAH: The Plot to Steal a MiG-15,” Accessed May 07, 2011. <http://www.psywarrior.com/Moolah.html>.

⁶⁷ Stephen E. Pease, *PSYWAR: Psychological Warfare in Korea, 1950–1953* (Harrisburg: Stackpole Books, 1992), 24–25.

Research for psywar, to provide summary data on enemy culture, morale, issues, idiom, personalities, etcetera, has barely been initiated. The large volume of bulk intelligence and basic reference materials available, containing pertinent information and data, makes research a requirement for any large scale psywar program.⁶⁸

Overall, the 1st Radio & Leaflet Group did not have the in-depth knowledge necessary of the Chinese, Russian and North Korean TAs. For example, in a conversation between Lieutenant No Kum-Sok, the North Korean pilot who defected with the MiG-15, and retired SGM Herbert Friedman, Lieutenant No stated, “We had no concept of the value of the dollar...My salary was 500,000 Chinese Won per month, which was worth about \$50 in U.S. currency...I was absolutely ignorant of what could be purchased with \$100,000 then.”⁶⁹ In other words, the offering of \$100,000 did not mean anything to the North Korean pilots.

The incomprehension of the true worth of the \$100,000 reward created “semantic noise.” Semantic noise, identified in Chapter III, occurs when the PSYOP planner uses phrases, symbols, language dialects, slangs, etc., in the PSYOP message that the TA does not understand. In this case, the ignorance of the value of American dollars by the North Korean pilots caused the message to be weak and misunderstood.

2. Message: There were three variations of the Operation Moolah leaflet that was dropped. Each leaflet was written in the Russian, Chinese, and Korean languages. The main text of the leaflet reads as follows:

To: Brave Pilots of Jet Aircraft

Subject: A Road to Freedom

Pilots! The Far East Command offers its help to all brave pilots who wish to free themselves from the vicious whip of the Communist regime and start a new and better life, with proper honor in the Free World.

⁶⁸ George S. Pettee, *Technical Memorandum ORO-T-3: US PSYWAR Operations in the Korean War* (Chevy Chase, Maryland: Operations Research Office, Johns Hopkins University, 1951), 3.

⁶⁹ Herbert A. Friedman, “OPERATION MOOLAH: The Plot to Steal a MiG-15,” Accessed May 07, 2011. <http://www.psywarrior.com/Moolah.html>.

The Far East Command offers you refuge, protection, human care and attention. You are given full guarantee that your names will remain secret if you do desire. Pilots! Your brave move will bring you to freedom and will give you opportunity to live in the future without fear for your well-being. Besides that, your heroism and decision will help others by pointing to them the road to freedom.

The Far East Command will reward \$50,000 United States dollars to any pilot who delivers a modern, operational, combat-type jet aircraft in flyable condition to South Korea. The first pilot who delivers such a jet aircraft to the Free World will receive a bonus of an additional 50,000 US dollars for his bravery.

Following is a list of instructions to all pilots who desire to free themselves from the Communist yoke. Escapee pilots will fly to Paengyong-do Island, fifty (50) kilometers south of Chodo Island. From Paengyong-do escapee pilots will proceed to Kimpo Air Base at 6100 meters altitude, descend over Kimpo Air Base, and proceed to make an immediate landing. UN Aircraft will accompany escapee remaining always above and behind, unless low clouds or visibility prevent escapee from locating Kimpo Airbase. If escapee is unable to make a visual let-down, he will proceed to the Seoul area at 6100 meters and circle with his gear down. A United States aircraft will then fly close abreast and lead the way to the landing field. Upon initial contact with UN Aircraft, or if at any time UN Aircraft attempts attack, escapee will immediately lower landing gear and rock wings violently.

The Free World shall welcome you as an old friend as well as a hero.

Mark W. Clark

General, United States Army Commander-in-Chief

Far East Command⁷⁰

All three messages were almost exactly alike. The back of the Chinese and Korean language leaflets had an additional message that read: "This is a message from

⁷⁰ Herbert A. Friedman, "OPERATION MOOLAH: The Plot to Steal a MiG-15," Accessed May 07, 2011. <http://www.psywarrior.com/Moolah.html>.

the Americans to any jet pilot who reads Russian. If you know such a person, please give it to him. It tells him how to escape to the UN Forces.”⁷¹

Using the PSYOP model as an analytical tool, we can further identify mistakes that were made when the message was crafted. In addition to the meaningless sum of money offered, the instructions given to potential defectors were also culturally inappropriate and introduced semantic noise. Critiquing the instructions on the leaflet, LT No stated the following:

During the last 90 days of the war, MiGs seldom flew to North Korea. Chodo is 100km (62 miles) southwest of Pyongyang in the Yellow Sea. To fly to Chodo would be all but fatal at that time. Moreover, flying from Chodo to Paengyong-do, 50 km (31 miles) over the sea does not make any sense. Nobody had ever heard of Paengyong-do in the Yellow Sea. Finally, proceed from Paengyong-do to Kimpo, 200 km (124 miles) at 6100 meter (20,000 feet) altitude. Any MiG following the above flight path for defection would have been an easy prey for the Sabre jets.⁷²

In other words, the instructions given to the pilot did not make any sense. Although the source of the message perhaps could not have known that North Korean pilots had not heard of Paengyong-do, they should have known that at the altitude they gave, 20,000 feet, MiGs would be easily attacked and possibly shot out of the sky by Sabre jets.

3. Channel/Medium: Leaflets and radios were the medium of choice for this operation. Millions of leaflets and fourteen radio stations carried the message to the TA.⁷³ As with the message, several problems occurred because of the medium. The leaflets were not dropped in the right place. Furthermore, the TA did not have access to a radio in order to listen to the broadcasts. According to Lieutenant No, “When the two B-29s dropped those million Moolah leaflets along the Yalu River, my MiG-15 Squadron was stationed in Tunghua Air Base, about 50 miles north of Manpo on the Yalu River. The Americans dropped no leaflets there and we had no radio. I do not believe any North

⁷¹ Friedman, “OPERATION MOOLAH,” <http://www.psywarrior.com/Moolah.html>.

⁷² Herbert A. Friedman, “OPERATION MOOLAH: The Plot to Steal a MiG-15,” Accessed May 07, 2011. <http://www.psywarrior.com/Moolah.html>.

⁷³ Ibid.

Korean pilots saw the leaflet. Our unit had returned to the Dandong airbase in early July 1953. All the MiG-15s flew to combat from China most of the time.”⁷⁴ This statement clearly shows that both mediums were ineffective in reaching their TA.

4. Receiver/TA: The intended TA was any pilot who flew a MiG-15. Ideally, the United States wanted a Soviet pilot, but a Chinese or Korean pilot would do. In order to persuade a communist pilot to defect to the West, the receiver would have to first be receptive to the message. The message and the medium are both important for influencing TA receptivity, specifically both needs to be credible in order for the TA to be open to the idea of defecting. In order to produce receptiveness, the message should have included something that the pilot wanted and understood. LT No stated, “The defecting pilot had to be an anti-Communist who wanted political asylum in the United States. Therefore, a statement in the leaflet of guaranteeing freedom and a job in America after defection would have been more effective.”⁷⁵ In the case of LT No, the defector was not receptive to the idea of defecting for a cash payment, freedom and political asylum would have been more effective incentives.

b. Operation Moolah PSYOP Matrix

Using the PSYOP model and matrix to analyze Operation Moolah yields the following findings. In this case, all four variables—in-depth knowledge of the TA, the message, the medium, and the receptiveness of the TA—are considered weak. Since the overall intent of the operation was to acquire a combat-capable MiG-15 by a defecting pilot, and it did not do this, it can be argued that the operation was unsuccessful.

However, the operation had positive secondary effects that allowed the PSYOP planners to come to the conclusion that the operation was successful. Since these secondary effects—the drop in sorties and the increase of MiG-15 shoot downs—were not the original intent of the operation, they cannot be used to measure the success or

⁷⁴ Herbert A. Friedman, “OPERATION MOOLAH: The Plot to Steal a MiG-15,” Accessed May 07, 2011. <http://www.psywarrior.com/Moolah.html>.

⁷⁵ Ibid.

effectiveness of the operation. Even though Operation Moolah was considered the most effective PSYWAR campaign in the Korean War, it had little by way of in-depth knowledge of the TA, messaging, the mediums chosen, and creating receptiveness in its TA, in addition to failing to acquire a combat-capable MiG-15. The findings are summarized in Figure 7.

	STRONG	WEAK	NOTES
In-Depth Knowledge of the TA		• The proper conditions, vulnerabilities, susceptibility, and accessibility were not identified • Semantics were not identified	• No information on what research was conducted • Believe defectors would defect based on the money offered, not wanting freedom • Semantics were introduced in the messaging thus proving that semantics were not identified
MESSAGE		• Has semantic noise • TA does not understand message • The proper conditions, vulnerabilities, legitimate appeals, persuasion techniques, influence tactics are not used	• TA did not understand the concept of the value of the U.S. dollar • An appeal should have been made in terms of guaranteeing freedom and a job in the U.S.
MEDIUM		• Does not reach a majority of the TA • Does not have credibility • TA is not able to receive the message through the medium (if a radio broadcast is used, a majority if not all of the TA have to have a radio)	• Leaflets were not dropped in the right area (According to LT No) • No one could have trusted the authenticity of the offer (According to LT No) • TA could not receive the message through the radio
RECEPTIVENESS OF THE TA		• TA is not open to arguments, ideas, or change	• The TA was not open to the idea of defecting because of the financial offer (To be receptive, an offer of freedom and a job offer in the U.S. would have been better suited for the TA to be open to the idea of defecting)

Figure 7. PSYOP Matrix (Operation Moolah)

2. Safe Conduct Pass Leaflets

During the war in Korea, U.S. forces used leaflets, loudspeakers, and radios extensively to carry the PSYOP messages to civilians, friendly forces,⁷⁶ and enemy

⁷⁶ Friendly forces were the South Korean troops who were fighting the North Koreans before the U.S. or UN arrived.

troops. The most preferred method, leaflets, were dropped by aircraft, delivered by artillery and, on rare occasions, patrols left leaflets “in the most-traveled areas behind the enemy lines.”⁷⁷ Because leaflets dropped from aircraft would be scattered over a large area, “the 105mm howitzer remained the principal artillery piece for placing propaganda-loaded shells on pinpoint targets.”⁷⁸ Over the course of the war, hundreds of millions of leaflets were scattered across the Korean peninsula. These leaflets, described as “printed advertisements” by military historian Stephen Pease, varied in size with the smallest measuring 3 by 5 inches to the largest being the size of a newspaper.⁷⁹

The first leaflet dropped occurred less than twenty-four hours after “President Harry Truman announced that U.S. troops, supporting United Nations decisions, would come to the assistance of the invaded Republic of South Korea.”⁸⁰ This leaflet targeted South Korean troops and civilians; it was very basic in design and informed the troops and civilians that help was on the way and to stand firm.⁸¹ Weeks later, the first leaflet targeting enemy troops was dropped. For the remainder of the war, more than one hundred types of leaflets were dropped that were focused on three major military objectives: weakening the effectiveness and resistance of the North Korean (and, later, the Communist Chinese) People’s Army; bringing the truth about the war to the people of North Korea; and bolstering the morale of the South Korean troops and civilian population.⁸²

⁸¹ Stanley Sandler, “*Cease Resistance: It’s Good For You!*”: *A History of U.S. Army Combat Psychological Operations* (Fort Bragg, NC: U.S. Army Special Operations Command Historical Monograph Series No. 9, 1999), 207.

⁸² Stephen E. Pease, *PSYWAR: Psychological Warfare in Korea, 1950–1953* (Harrisburg: Stackpole Books, 1992), 18.

The safe conduct pass, which aimed to weaken the effectiveness and resistance of the North Koreans, would become the most famous leaflet used during the war. The safe conduct pass played on the terrible conditions that enemy troops faced, including lack of food, shelter, medical supplies, and their freedom. The leaflet gave instructions for how to surrender and promised food and humane treatment for those who defected.⁸³ The Far East Command's Psychological Warfare Section and the Eighth Army's Psychological Warfare Division developed several different variations of this message, all encouraging enemy surrenders and defections. However, after learning that "more than thirty percent of the surrendering soldiers were functionally illiterate, able to read only road signs and the simplest instructions,"⁸⁴ safe conduct passes and surrender leaflets changed and included an easy to read map that showed the best way to UN positions.

Another change to the surrender leaflet occurred when PSYWAR planners learned that the black bars they used in photographs to hide the identity of the POW's picture on the leaflet were being exploited by Communist officers. "Communist political officers were explaining [to their troops] that the black bars were there to hide the scars from disfiguring chemical warfare experiments."⁸⁵ As a result, the black bars were removed so the POW's picture could be seen and to show that there was nothing wrong with them.

a. *Analysis of the Safe Conduct Pass*

The PSYOP model produces the following analysis:

1. In-depth knowledge: Just as the previous case study, in-depth knowledge of the TA can be considered weak because there was no information on the research conducted before developing the safe conduct passes. There is evidence that the Eighth Army's Psychological Warfare Division lacked the proper resources needed in

⁸³ Stephen E. Pease, *PSYWAR: Psychological Warfare in Korea, 1950–1953* (Harrisburg: Stackpole Books, 1992), 77.

⁸⁴ *Ibid.*, 40.

⁸⁵ *Ibid.*, 81.

acquiring the in-depth knowledge of the TA that was needed. In the technical memorandum *Eighth Army Psychological Warfare in the Korean War*, it states that:

EUSAK [Eighth United States Army in Korea] Psywar has little or no library...there is actually no library for the division as a whole. The Projects Group does, however, have a small collection of materials and books. These include three Hong-Kong newspapers, Chinese and Soviet picture magazines, several books on China and Korea (e.g., Crow's Five Hundred Million Customers, Osgood's Ethnology of Korea), Chinese and Korean dictionaries, Army psywar manuals, Linebarger's Psychological Warfare, a college textbook on psychology and collections of the speeches of Mao Tse-tung and Ghu The, as well as official reports of various kinds.⁸⁶

The strongest evidence that the Far East Command's Psychological Warfare Section and the Eighth Army's Psychological Warfare Division had insufficient knowledge of the TA is the fact that they printed elaborate instructions and were unaware that a significant portion of the TA was illiterate. Once this was discovered, they made improvements to the safe conduct pass and included a map. Furthermore, after the Psychological Warfare section learned that the black bars on the leaflet pictures were believed to be hiding marks of torture, the black bars were removed so the POW's picture could be seen and to show that there was nothing wrong with them.

2. Message: The Far East Command's Psychological Warfare Section and the Eighth Army's Psychological Warfare Division created several variations of the safe conduct pass and each leaflet was written in the Korean, Chinese, and English languages. Although each pass varied, they usually carried the same message to the enemy, which stated:

WHEN YOU COME OVER TO THE U.N. FORCES, IT IS
IMPORTANT TO FOLLOW THESE STEPS.

1. Wait for a favorable time to escape from your unit.
2. Destroy or bury your weapons.

⁸⁶ Willmoore Kendall, *Technical Memorandum ORO-T-17(FEC): Eighth Army Psychological Warfare in the Korean War* (Chevy Chase, Maryland: Operations Research Office, Johns Hopkins University, 1951), 32.

3. Make your way to the nearest UN forces during daylight hours only.
4. Come down an open road in single file, with both hands raised above your head.
5. Bring your wounded brothers with you.⁸⁷

The English portion of the message stated:

Attention all soldiers of the United Nations Forces. This leaflet guarantees humane treatment to any North Korean desiring to cease fighting. Take this man to your nearest commissioned officer at once.⁸⁸

Another leaflet stated:

1. This is from the UN, to you soldiers. If you have a friend you can trust, please let him read it, too.
2. If you want to escape, try it at night.
3. The UN soldiers will warmly welcome you.
4. Please come safely and the UN will give you food, a warm place, and medical treatment. You will be happy and welcome.⁸⁹

Because the message was basic, easy to read, and had clear instructions, it was very effective in informing enemy combatants that could read the best way to surrender. Following the discovery that roughly 30% could not read, the pass provided a visual map for the enemy troops to follow. Semantic noise was not introduced in the message, making it clear and easy to understand.

3. Channel/Medium: The medium that was chosen to carry the safe conduct pass was the leaflet; millions were dropped all over enemy positions. Because enemy troops could be executed for carrying these safe conduct passes, U.S. forces

⁸⁷ Carl Berger, "The Korean Safe-Conducts," *The Art and Science of Psychological Operations: Case Studies of Military Application*, (Washington, DC: Department of the Army, 1976), 408.

⁸⁸ Stephen E. Pease, *PSYWAR: Psychological Warfare in Korea, 1950–1953* (Harrisburg: Stackpole Books, 1992), 78.

⁸⁹ Pease, *PSYWAR*, 81.

designed many of them to resemble banknotes, which allowed enemy troops to conceal the safe conduct pass from their superiors until the time came for them to be used. The leaflets had credibility because they “carried the signature of the United Nations Commander, General Douglas MacArthur or his successor, General Matthew Ridgway...the Eighth Army [safe conduct pass] was signed by General James Van Fleet.”⁹⁰

4. Receiver/TA: The intended TA was enemy troops. Because of the conditions that enemy troops faced—lack of food, shelter, medical supplies, and freedom—they were receptive to a message offering these things in return for surrendering. In one survey of 750 POWs, the “prisoners asserted the greatest obstacle to surrender was the fear of being killed...The promise of cigarettes and freedom from hard labor as well as safety from aerial attack were important to these captives, most of whom claimed that they believed the ‘happy POW’ accounts in many leaflets.”⁹¹ In the following list from technical memorandum *US PSYWAR Operations in the Korean War*, dated January 1951, the following number of POWs was recorded.

⁹⁰ Carl Berger, “The Korean Safe-Conducts,” *The Art and Science of Psychological Operations: Case Studies of Military Application*, (Washington, D.C.: Department of the Army, 1976), 407.

Figure 8. Reasons for Surrender⁹²

Because the PSYWAR column in the table is not further broken down into what type of PSYWAR was the cause of their surrender, either by leaflet, loudspeaker, or radio, it is hard to tell what percentage of the total number of surrenders were actually influenced by a safe conduct pass leaflet.

b. Safe Conduct Pass PSYOP Matrix

Using the PSYOP model and matrix to analyze the case yields the following conclusions. In this case, three of the four variables—the message, the medium, and the receptiveness of the TA—are considered strong. One variable, in-depth knowledge of the TA, is considered weak. (See Figure 9.)

Various accounts claim the successfulness of the leaflets in terms of the number of enemy troops that surrendered, “Some estimate that more than 100,000 North Korean and Chinese soldiers surrendered as a result of US PSYWAR activities;”⁹³ however, there was no distinction between what type of PSYWAR influenced the enemy

⁹² George S. Pettee, *Technical Memorandum ORO-T-3: US PSYWAR Operations in the Korean War* (Chevy Chase, Maryland: Operations Research Office, Johns Hopkins University, 1951), 42.

⁹³ Stephen E. Pease, *PSYWAR: Psychological Warfare in Korea, 1950–1953* (Harrisburg: Stackpole Books, 1992), 37.

to surrender and if there were other causes that prompted enemy troops to desert. It is difficult to say with certainty that the safe conduct pass leaflet accounted for a definitive amount of enemy surrenders throughout the war, despite the high number of defectors.

	STRONG	WEAK	NOTES
In-Depth Knowledge of the TA		The proper resources were not used to acquire the needed knowledge of the TA	- No information on what research was conducted - Eighth Army lacked the resources needed to conduct the proper research
MESSAGE	- Clear of semantic noise - TA understands message - The proper conditions, vulnerabilities, legitimate appeals, persuasion techniques, influence tactics are used		- Semantics were not introduced in the messaging thus providing a clear message - TA understood the message - Identifying the need for food, medical supplies, and proper treatment allowed for an effective message
MEDIUM	- Reaches a majority of the TA - Has credibility - TA is able to receive the message through the medium (if a leaflet is used with written text, the TA must be able to read)		- Leaflets were dropped all over enemy positions - The leaflet had credibility because it was signed by General MacArthur and General Van Fleet - Although a majority of the TA was illiterate, a simple map showed them how to surrender
RECEPTIVENESS OF THE TA	TA is open to arguments, ideas, or change		Because of the conditions that enemy troops faced, they were open to the idea of surrendering because of the offering of food, medical supplies, and humane treatment

Figure 9. PSYOP Matrix (Safe Conduct Pass Leaflet)

3. Loudspeaker Surrender Appeals

Loudspeakers were rarely deployed during the early months of the war. In January 1951, seven months after the war started, George Pettee explained in the technical memorandum *US PSYWAR Operations in the Korean War* that “Public address, or loudspeaker equipment, has been used on a scale so small as to be little more than

experimental. Although widely and effectively used by many forces on both sides in World War II, there has been little equipment available in Korea, and what has been available has been used with little effect.”⁹⁴

The unit responsible for conducting tactical level PSYWAR was the 1st Leaflet & Loudspeaker Company. This unit, which was originally the twenty-person Tactical Information Detachment at Fort Riley, Kansas, was expanded, renamed, and sent to Korea, arriving in November 1950.⁹⁵ Within this deployment, the Loudspeaker Platoon was pushed down to commanders to be utilized along the front lines.⁹⁶ Although the 1st Leaflet & Loudspeaker Company was issued three loudspeakers, which were mounted on one-quarter ton trailers, only two of the loudspeakers had arrived in Korea by the end of November 1951; of the two that had arrived, only one was working.⁹⁷ However, over the next few months, the 1st Leaflet & Loudspeaker Company increased in size, and early in 1951, “there were 12 to 21 [loudspeaker] teams, with four or more usually posted to each corps and one per division on the line.”⁹⁸

According to military historian Stanley Sandler, there were a number of advantages that loudspeakers had compared to leaflets. “[A loudspeaker] was not ‘wasted’ like approximately ninety percent of the tens of millions of leaflets produced in this war, it had obviously more of an appeal to semi-literate peasants than leaflets, and the Korean language (Hangul) seemed more suited to the spoken than to the written word. In addition, enemy cadre could hardly forbid their men to listen, as they could

⁹⁴ George S. Pettee, *Technical Memorandum ORO-T-3: US PSYWAR Operations in the Korean War* (Chevy Chase, Maryland: Operations Research Office, Johns Hopkins University, 1951), 23.

⁹⁸ Stanley Sandler, “*Cease Resistance: It’s Good For You!*”: *A History of U.S. Army Combat Psychological Operations* (Fort Bragg, NC: U.S. Army Special Operations Command Historical Monograph Series No. 9, 1999), 226.

prohibit their picking up leaflets.”⁹⁹ The message of choice by the loudspeaker teams was the surrender appeal. Because the “range of the loudspeaker was 1,000 yards to one mile,”¹⁰⁰ teams were brought to the front lines to broadcast their appeals to the enemy.

A May 1951 command report attributed success to the loudspeaker teams, arguing that:

Nine (9) teams operated during the period with all American divisions, and with other United Nations forces, conducting a total of forty-eight (48) missions...A known total of two thousand nine hundred forty three (2943) prisoners surrendered as a direct result of ground loudspeaker broadcasts. This is a considerable increase over the preceding period.¹⁰¹

a. Analysis of Loudspeaker Surrender Appeals

The PSYOP model produces the following analysis:

1. In-depth knowledge: Just as the previous case studies, in-depth knowledge of the TA can be considered weak because there was no information on the research conducted before developing the safe conduct passes. Also, just as with safe conduct passes, it can be said that the Eighth Army’s Psychological Warfare Division lacked the proper resources needed in acquiring the in-depth knowledge of the TA that was needed. The *Eighth Army Psychological Warfare in the Korean War* states that:

EUSAK [Eighth United States Army in Korea] Psywar has little or no library...there is actually no library for the division as a whole. The Projects Group does, however, have a small collection of materials and books. These include three Hong-Kong newspapers, Chinese and Soviet picture magazines, several books on China and Korea (e.g., Crow’s Five Hundred Million Customers, Osgood’s Ethnology of Korea), Chinese and

¹⁰⁰ Stanley Sandler, “*Cease Resistance: It’s Good For You!*”: *A History of U.S. Army Combat Psychological Operations* (Fort Bragg, NC: U.S. Army Special Operations Command Historical Monograph Series No. 9, 1999), 226.

¹⁰¹ Stephen E. Pease, *PSYWAR: Psychological Warfare in Korea, 1950-1953* (Harrisburg: Stackpole Books, 1992), 187-188.

Korean dictionaries, Army psywar manuals, Linebarger's Psychological Warfare, a college textbook on psychology and collections of the speeches of Mao Tse-tung and Ghu The, as well as official reports of various kinds.¹⁰²

Although the Eighth Army initially lacked the required resources needed to better understand the TA, by the summer of 1951, the 1st Leaflet & Loudspeaker Company had acquired “more than 139 military, civilian and indigenous personnel, (which included 10 professional Chinese and Korean translators and interviewers).”¹⁰³ These indigenous personnel and professional translators helped in the development of loudspeaker scripts, thus reducing semantic noise. Thus, the in-depth knowledge of the TA improved over time and with the acquisition of indigenous help.

2. Message: The message of choice by the loudspeaker teams was the surrender appeal. Examples of broadcasted statements include:

Soon you will be committed to battle again to be sacrificed in the UN's sea of fire. Think of the thousands and thousands of your comrades who have already died for nothing in this foreign land. Friends, be wise, come to the UN lines, at the first opportunity you are guaranteed good treatment.

Or

Here's how to escape and come to UN lines. Listen carefully to the instruction which follows...Listen carefully...This is the way to escape your unit and come over to the UN lines:...’’¹⁰⁴

Sandler claims that “typical U.S. loudspeaker messages avoided overt political themes and usually offered a way out for the individual enemy soldier.” Furthermore, because indigenous personnel and professional translators were used, the

¹⁰² Willmore Kendall, *Technical Memorandum ORO-T-17(FEC): Eighth Army Psychological Warfare in the Korean War* (Chevy Chase, Maryland: Operations Research Office, Johns Hopkins University, 1951), 32.

¹⁰³ Stanley Sandler, “*Cease Resistance: It's Good For You!*”: *A History of U.S. Army Combat Psychological Operations* (Fort Bragg, NC: U.S. Army Special Operations Command Historical Monograph Series No. 9, 1999), 216.

¹⁰⁴ Loudspeaker scripts in “Contingency Scripts, Loudspeaker Platoon, 1st L & L”, n.d., n.p.; and 1st L & L Co., “Command Report,” for July 1952, cited by Stanley Sandler, “*Cease Resistance: It's Good For You!*”: *A History of U.S. Army Combat Psychological Operations* (Fort Bragg, NC: U.S. Army Special Operations Command Historical Monograph Series No. 9, 1999), 228–229.

messages were easy to understand and did not have semantic noise introduced unknowingly by U.S. forces. Messages were kept short, between 60 to 90 seconds, and followed the following guidelines;

1. Be used as a tactical weapon, with no lofty strategic (or “political”) messages (“End the War!” “Fight Communism!”).
2. Use simple, easy-to-understand messages.
3. Take a firm note.
4. Always repeat “punch line.”
5. Sound “official” in tone and language.
6. Personalize target, by name, if possible.
7. Give directions on how to surrender.
8. Preface message with English-language warning to friendly forces not to shoot defectors coming across the lines (easier said than done).
9. Give up-to-date news.
10. Use native-speakers if at all possible, to avoid foreign accent.¹⁰⁵

3. Channel/Medium: Along with leaflets, the medium that was chosen to carry the surrender message was the loudspeaker. With the range it had, loudspeakers were particularly useful on the front lines. It can be inferred that these broadcasts were threatening to enemy troops because loudspeaker broadcasts were fired upon by the enemy. According to Sandler, one study reported, “Hardly a day went by during the last year of the war without reports that the enemy had countered broadcasts with a generous amount of mortar or artillery rounds...a good many of the ground loud-speakers...were

¹⁰⁵ “Student Summary, Army General Ground School”, Conference on Loudspeakers, Air Dropped Newspapers, n.d., in Vatcher Papers, box 11, “Korean War” folder, cited by Stanley Sandler, *“Cease Resistance: It’s Good For You!”: A History of U.S. Army Combat Psychological Operations* (Fort Bragg, NC: U.S. Army Special Operations Command Historical Monograph Series No. 9, 1999), 226.

destroyed by enemy counter fire.”¹⁰⁶ Also, because the loudspeakers were so effective in reaching the enemy, Communist officers usually ordered their men to make noise to drown out the broadcast. Soldiers were told to fire their weapons, bang on containers, ring bells, and sing in hopes that they would not be able to hear the message.¹⁰⁷ These activities point to both the effectiveness of the medium in reaching the enemy and the message it carried.

4. Receiver/TA: As with the safe conduct pass leaflets, the intended TA was enemy troops. Loudspeaker surrender appeals seemed to work best after a major offensive took place. Sandler again observes: “After the 3rd Division’s task force had flanked and decimated the targeted enemy, the loudspeaker team chief drew up a “threat-surrender” message for the survivors and “many” enemy troops surrendered.”¹⁰⁸

Sandler reports that “From January 1951 to the Armistice of 27 July 1953, 8th Army loudspeaker teams made 20,000 distinct broadcasts”¹⁰⁹ Although General McClure, who was head of the Office of the Chief of Psychological Warfare, “claimed that something like one-third of enemy surrenderees had been “influenced in their decision” by U.S. psywar,”¹¹⁰ it is not known how many of them surrendered because of loudspeaker broadcasts. However, one can come to the conclusion that loudspeaker broadcasts could account for a fair amount of these surrenders based on the large number of broadcasts made.

¹⁰⁶ Stanley Sandler, *“Cease Resistance: It’s Good For You!”: A History of U.S. Army Combat Psychological Operations* (Fort Bragg, NC: U.S. Army Special Operations Command Historical Monograph Series No. 9, 1999), 227.

b. Loudspeaker Surrender Appeal PSYOP Matrix

Using the PSYOP model and matrix to analyze the loudspeaker surrender appeal yields the following findings. In this case, two of the four variables—message and medium—are considered strong and the other two—in-depth knowledge of the TA and the receptiveness of the TA—are considered weak. (See Figure 10.)

As with leaflets, the use of loudspeaker surrender appeals correlated with high numbers of defectees. This can be observed by taking in to account the number of broadcasts made throughout the war and the number of enemy personnel who surrendered. As stated earlier, it is estimated that more than 100,000 enemy troops surrendered due to U.S. PSYWAR and over 20,000 distinct broadcasts were made directed toward enemy troops. From this information, one can infer that the loudspeaker broadcasts had had some effects toward the enemy and ultimately caused them to surrender

	STRONG	WEAK	NOTES
In-Depth Knowledge of the TA		The proper resources were not used to acquire the needed knowledge of the TA	- No information on what research was conducted - Eighth Army lacked the resources needed to conduct the proper research
MESSAGE	- Clear of semantic noise - TA understands message - The proper conditions, vulnerabilities, legitimate appeals, persuasion techniques, influence tactics are used		The messages were clear and did not contain semantic noise
MEDIUM	- Reaches a majority of the TA - Has credibility - TA is able to receive the message through the medium (if a leaflet is used with written text, the TA must be able to read)		- Loudspeakers were brought close enough to the front lines to reach the TA - Enemy forces knew the broadcasts were from U.S. personnel - Most of the time, the TA could receive the message unless they were ordered to make noise by their superior to drown out the message
RECEPTIVENESS OF THE TA		TA is not open to arguments, ideas, or change	Unless something triggered the enemy's receptiveness (after a major attack or artillery barrage) they were not likely to be receptive of the surrender appeal

Figure 10. PSYOP Matrix (Loudspeaker Surrender Appeal)

B. SUMMARY OF FINDINGS

Out of the three cases analyzed, none of them had four strong variables. One case had four weak variables, Operation Moolah, one case had three strong variables, and one weak variable, safe conduct pass leaflet, and one case had two strong variables and two weak variables, loudspeaker surrender appeals. In-depth knowledge of the TA was weak in all three. Message was weak in one, Operation Moolah, and strong in the other two, safe conduct pass leaflet and loudspeaker surrender appeal. Medium was weak in one, Operation Moolah, and strong in the other two, safe conduct pass leaflet and loudspeaker surrender appeal. Receptiveness of the TA was weak in two, Operation Moolah and loudspeaker surrender appeal, and strong in one, safe conduct pass. The findings are summarized in Figure 11.

	STRONG VARIABLES	WEAK VARIABLES
OPERATION MOOLAH		• In-depth knowledge of the TA • Message • Medium • Receptiveness of the TA
Safe Conduct Pass Leaflet	• Message • Medium • Receptiveness of the TA	• In-depth knowledge of the TA
Loudspeaker Surrender Appeal	• Message • Medium	• In-depth knowledge of the TA • Receptiveness of the TA

Figure 11. Summary of Findings

THIS PAGE INTENTIONALLY LEFT BLANK

V. CONCLUSION

After analyzing communication theory and applying the PSYOP model and matrix to three cases of tactical PSYOP in the Korean War, this thesis offers the following general conclusions. First, PSYOP is not successful when all four variables are weak in the PSYOP message. Second, successful PSYOP is possible, when there are two or more strong variables present in the operation. Finally, since the three case studies can be classified as tactical PSYOP,¹¹¹ the general conclusions made here cannot be applied to strategic or operational PSYOP. Each of these points will be elaborated below.

A. THE FOUR VARIABLES

The strength of the four variables studied in this thesis—in-depth knowledge of the TA, the message, the medium, and the receptiveness of the TA—offers insights on the potential success of a given PSYOP operation.

1. In-Depth Knowledge of the TA

In all three cases, in-depth knowledge of the TA was weak. One can come to the conclusion that, for tactical PSYOP, in-depth knowledge of the TA is not necessary for tactical level PSYOP; the PSYOP planner only needs to have a basic knowledge of the TA in order to be effective.

The following questions can provide the basic knowledge that the PSYOP planner needs of the TA to execute successful tactical PSYOP:

- Can the TA read?
- Can the TA understand basic drawings and pictures?
- What conditions, such as weak leadership, lack of food and medical care, fear of death, or lack of training, can be exploited to cause the TA to surrender?
- What medium can best reach the TA?

¹¹¹ The overall intent of the cases was to cause the enemy to surrender or defect.

There may be more questions but, with these basic four questions, the PSYOP planner will gain enough knowledge of the TA to craft an effective PSYOP message.

2. Message

In two of the cases, the message was strong. These two cases, safe conduct pass leaflets and loudspeaker surrender appeal, were successful in influencing the TA to surrender. By contrast, a weak message, which was present in Operation Moolah, caused that operation to be unsuccessful. From these cases, one can conclude that, for tactical PSYOP, the message needs to be strong in order for the PSYOP operation to be successful. The message is considered strong when it does not contain semantic noise, the TA is able to understand it, and the proper conditions, vulnerabilities, legitimate appeals, persuasion techniques, and influence tactics are used when it is crafted.

3. Medium

In two of the cases—safe conduct pass leaflets and loudspeaker surrender appeal—the medium correctly fit the operation and therefore was strong. Operation Moolah, by contrast, had an ineffective medium, which contributed to its lack of success. From these observations, one can conclude that, for tactical PSYOP, the medium needs to be strong in order for the PSYOP operation to be successful. The medium is considered strong when it is able to reach a majority of the TA, and it has credibility. For example, the TA need to be literate in order to read a leaflet with words.

4. Receptiveness of the TA

In two of the cases, receptiveness of the TA was weak. Of these two cases, loudspeaker surrender appeal and Operation Moolah, only loudspeaker surrender appeal was successful in influencing the TA to surrender; Operation Moolah was unsuccessful. A strong receptiveness of the TA, identified in safe conduct pass leaflet, is necessary for tactical PSYOP to be successful. Receptiveness of the TA is considered strong when the TA is open to arguments, ideas, or change.

B. THE THREE CASES

1. Operation Moolah

Analysis of Operation Moolah shows that if all four variables are weak, then the PSYOP operation will be unsuccessful. Even though the unintended effects of the operation were profoundly positive, the operation's goal—influencing a Soviet or North Korean pilot to defect with a combat capable MiG-15 jetfighter—was not met.

2. Safe Conduct Pass Leaflets

For both safe conduct pass leaflets and loudspeaker surrender appeal, in-depth knowledge of the TA was weak. However, a basic knowledge of the TA allowed the PSYOP planner to choose the right medium and craft the right message to be successful. Analysis of the safe conduct pass leaflets demonstrates that if the two or more variables that are strong include the message and the medium, then the likelihood of the PSYOP operation's success will increase. The fourth variable, receptiveness of the TA, is more complicated. Ultimately, enemy soldiers were receptive to the message and surrendered in large numbers. However, it is unclear whether they were receptive when they received the message, or became receptive over time. Further analysis of this variable can bring about insights as to how receptive the TA was when the safe conduct pass leaflet was dropped.

3. Loudspeaker Surrender Appeal

Analysis of the loudspeaker surrender appeal also demonstrates that if the two or more variables that are strong include message and medium, then the likelihood of the PSYOP's message will be successful increases. Analysis of the fourth variable, receptiveness of the TA, shows that loudspeaker surrender appeal was most effective when it was broadcasted to the TA after a major attack or aerial bombardment. In other words, the TA's receptiveness of the loudspeaker surrender appeal significantly changed after friendly forces did something to cause them to want to surrender. The TA's original conditions were not enough to cause them to be open to the idea of surrendering. As with

safe conduct pass leaflets and Operation Moolah, in-depth knowledge of the TA was also weak. However, a basic knowledge of the TA allowed the PSYOP planner to choose the right medium and craft the right message, aiding in the success of the operation.

C. IMPLICATIONS FOR PSYOP TODAY

The practitioners of PSYOP today can learn from both successful and unsuccessful PSYOP from past operations. These cases offer valuable insights on what the PSYOP planner needs to focus their time and effort. For tactical PSYOP, the importance of a strong message and the choice of a strong medium can cause the operation to be successful; in-depth knowledge of the TA is not necessarily needed while executing tactical PSYOP. Second, receptiveness of the TA can be further enhanced when friendly forces do something before the PSYOP is executed. Further analysis of in-depth knowledge of the TA for strategic and operational PSYOP is needed in order to understand its importance for PSYOP operations at this level.

Furthermore, PSYOP planners can improve the effectiveness of their PSYOP products by applying the model and matrix presented in this thesis to their planning process. Specifically, PSYOP planners can compare the PSYOP matrix with their operation and make changes accordingly to any weak variables that they identify.

ABSTRACT

This thesis demonstrates the formulation and use of a "goal programming" model in optimizing the allocation of media for psychological operations. The parallels between advertising and psychological operations are outlined; particularly, those in connection with defining a product, specifying a target audience and measuring success. Attributes and limitations of the various forms of mass media are discussed. The problem is developed as one of minimizing the variance between a set of goals stated with respect to specified target audiences for varying time frames subject to budget and resource limitations. The goals considered are related to the total number of times that members of a target audience are subjected to propaganda, the percent subjected and frequency of subjection. Ultimately, a numerical example is presented to demonstrate the potential use of the model.

CHAPTER I

INTRODUCTION

The use of propaganda techniques, whereby one party seeks to change or mold the behavioral and mental processes of another party, can be found throughout history. Indeed, the Bible cites many examples whereby these techniques are used to cause the people to fear the wrath of God. The books of the Prophets contain many examples of "propaganda"; e.g., the people are told that if they do not deny false gods, repent, and reform, they will suffer the eternal damnation of almighty God. However, in modern days, the term "propaganda" has been primarily reserved for usage in reference to war-connected or political activities; whereas, a country's internal use of propaganda is referred to as "advertising" or "marketing strategy". Karin Dovring, author of Road of Propaganda, has coined another term for propaganda. She writes:

"...Biased communication is a sophisticated term for propaganda, a word feared or avoided by all objective people and therefore a source of darkness and obscurity since nobody wants to talk about it but nevertheless everybody uses it."¹²

Advertising, biased communication and propaganda all seek to change behavior and herein lies the purpose for which this thesis is written. The commercial use of advertising has become much more sophisticated than that of its military counterpart. Many years have been expended in marketing research to determine the best methods of presenting information to a target audience so that they will buy a

certain product, vote for a given politician or change their beliefs. It is felt that this knowledge has not been satisfactorily applied to military problems. If there are techniques available that can create "needs" for items such as electric tooth brushes, pens that write under water or aftershave lotions that will make every man a Valentino; then, it seems reasonable that these same techniques could be used to "win the hearts and minds" of the populace in a given country or to cause an enemy force to fight less effectively or to surrender.

Historical Background of Modern Psychological Operations

The emergence of psychological operations as a rudimentary science is considered to be the First World War. In England, a Department for Enemy Propaganda (known as Crewe House) was established to co-ordinate the allied propaganda efforts. Representatives from France, the United States, and Italy worked with the British in unifying all propaganda efforts during the war. The efforts of Crewe House were lauded by the Germans subsequent to the war. However, this credit was largely undeserved; the Germans found it far more palatable to admit loss of the war due to propaganda efforts than they did to admitting that their armies had been severely defeated on the field of battle.¹⁵

The major lessons in psychological warfare (a term used almost interchangeably with psychological operations)

that evolved from the First World War are summarized as follows:

1. In many cases it is best for the propagandist to use self restraint in his efforts. The overstated case may well alienate a potential sympathizer.

2. Stereotyped and unimaginative propaganda, such as the German claims of allied atrocities, is worse than no propaganda at all.

3. Uncommitted nations are generally adversely impressed by any appeals for their sympathy or pity.

4. Denials of enemy propaganda are often dangerous. The old adage, "He who excuses himself accuses himself," proved to be true in a number of instances.¹⁵

The propaganda principles that were applied by Hitler and the German National Socialist party in their rise to power are in many ways at odds with what has come to be accepted as the "proper" means of establishing an effective psychological operations campaign. National Socialist propaganda was lacking in either internal or external consistency. At times it was hysterical and emotionally uncontrolled while at others it appeared to be the product of a cold and calculating intellect. However, its success cannot be denied. Hitler based his propaganda campaign to the German people on their desire for national self respect and personal self assurance, their self pity and fear, a belief that if Germany were given a chance she could surpass all other nations, and a claim that his party was one aimed at

the betterment of the "little man". Basically, Hitler's propaganda principles can be summarized as follows:¹⁸

1. Appeals to the emotions of a people are much more important than appeals to their reason. (Hitler believed in assertion and not in argument.)

2. The passions of a target audience must be directed at one clearly-defined enemy or they will become weakened by dispersal. (In the case of Germany this enemy was, of course, the Jews.)

3. All means whereby the populace receives information should be controlled. Strict censorship must be enforced.

4. Consistency is not important. (Hitler changed his propaganda messages to suit the mood and makeup of different target audiences.

By following these principles Hitler achieved unqualified success within Germany. However, his attempts to affect other nations in this way failed.

During World War II the allied forces considered propaganda to have a three-fold purpose: to impress and to depress one's enemies; to comfort, encourage and advise friends; and to divide one's enemies against one another. Further, propaganda was always to be truthful, consistent, and frank. (Later in the war it became apparent that being truthful was not sufficient; propaganda had to be believable.) In the long run, the psychological operations conducted by the allied powers proved to be more effective than any of those conducted by the axis powers.¹⁵

The relative austerity of the United States' propaganda efforts during the first two wars is succinctly stated by Doctor Hans Speir of Princeton University.

"In the two world wars American psychological warfare was improvised after the outbreak of hostilities and conducted according to hit-or-miss methods. No peace-time agency existed which had preserved and developed pertinent skills and knowledge in this field, trained expert personnel, or engaged in appropriate research and planning. Psychological warfare was regarded as an operation requiring no planning, training, and research."²³

Today, we are somewhat better off in our preparations for psychological operations but the field is still open to vast improvement. The American people do not like to believe that there is any need for "propaganda" and the term itself has come to connote a bad or evil practice. It is hard to imagine a "propaganda ministry" being established as a part of our national government. However, there is very definitely a need for some institution that would effectively serve this purpose. Agencies such as USIA are doing part of this job, but more needs to be done to cope with the many global conflicts that confront us today. We cannot rest on our laurels and expect the rest of the world to admire and support us because we are so all powerful or because the standard of living in our "great society" is so much above that of most of the rest of the world. Our country must strive to be more successful in combatting Communism than we have been in the years since the end of the Second World War. The instruments of global policy; propaganda, diplomacy, economics, and war must be judiciously

applied. Otherwise, many of the now emerging nations will become communist oriented.

Effective Propaganda

To be effective, propaganda must fill four essential conditions.¹²

1. It must gain and hold the attention of those people whom you specifically desire to receive your message; that is, your target audience.

2. It must be believable to both the members of the target audience and to others with whom they may discuss it.

3. It must be directed so as to lead the target audience along a path they are "willing" to follow.

4. It must be propagated in an environment that will allow the target audience to pursue the course of action desired.

This Thesis

Thus far we have discussed many of the reasons that make psychological operations important and have summarized some of the propaganda principles that have evolved since the First World War. This was done to stress the need for careful planning in preparing for psychological operations.

Once this planning has been accomplished and the propaganda themes have been established we must then decide on best ways to propagate our messages to specific target audiences. This is the problem area that is addressed by this thesis. Specifically, we shall develop analogies

between message dissemination in advertising and in psychological operations. Then, we shall show how a goal programming model that is currently being used to project "optimal" media allocation for advertising U. S. consumer goods can be successfully applied to use in psychological operations.

In the following chapters, we shall first discuss the meaning of the term "product" as it would be applied to psychological operations. Then, we will consider the audience itself; that is, its stratification, receptivity and access to various forms of communication media. Next, the problems of measuring the success of various psychological campaigns will be discussed in rather broad terms. This is not done to negate the importance of feedback. In fact, without some effectiveness measurement there would be no way to evaluate the predictive success of the media mix model that will be used. However, the problems inherent to evaluating success are in themselves still very much in the research stage.

Prior to presenting the media mix model, we shall discuss the basic communication process and some of the means of transmitting information. This is done so that the reader can better understand why considerations other than cost or number of people to be communicated with may be important. Some media vehicles (where "media vehicle" is defined to be the medium that brings a message to the attention of a target audience)²⁶ have greater prestige,

more impact, etc., than others. For instance, in the United States, a number of companies specify that "regardless of the cost" they want at least one advertisement to appear in Life magazine. Here, there is a definite prestige factor in that the company can then use the phrase, "as advertised in Life" in other advertisements.

Finally, we shall present an example of how the model can be used, state conclusions and make recommendations for further study in this area.

CHAPTER II

COMPARISON AND CONTRAST OF ADVERTISING TO PSYCHOLOGICAL OPERATIONS

In this chapter we shall discuss some of the major similarities and differences between advertising and psychological operations. In this way, we will be able to develop analogies that can be used in connection with the media mix model that will be presented in a later chapter.

Initially, a general overview concerning the applicability of advertising techniques in psychological operations will be given. Then, we shall consider the major factors that must be accounted for in both advertising and psychological operations. These are: the definition of the product; the target audience; and, the measures of success.

Obviously, there is not a one-to-one mapping of the parameters involved in advertising to those necessary for psychological operations. However, this has sometimes been taken to be the case. Writing about the United States' psychological warfare policy during the Second World War, Donald V. McGranahan refers to an "'advertising complex' that underlay our conception of propaganda." He goes on to state,

"Our ideas of successful propaganda in this country are derived to a large extent from the principles of advertising and public relations, and our policy makers, unconsciously perhaps, seem to have applied the same principles to psychological warfare."²³

Further on in his article, Mr. McGranahan does an excellent job in summarizing the advertising philosophies in order to compare them to their psychological operations counterparts.

"In advertising, you are careful not to offend the public or any important segment of it. Your interest is in the broadest mass audience and the lowest common denominator. You do not attack established values and symbols. You avoid debate and debatable issues, and make your appeals to attitudes that are widespread and noncontroversial--desire for physical comfort, health, beauty, popularity, love of home and children, etc. If the advertiser wants to introduce a social change, such as getting women to smoke cigarettes, he does so by indirect methods, never openly attacking the belief or custom that is the main obstacle to his efforts. When the advertising philosophy of propaganda is carried over into the field of national psychological warfare, it results quite naturally in the theory that we should avoid open discussion of political faith and loyalties, where opposing passions may be aroused, and concentrate on non-ideological uniformity among the enemy population."²³

This "advertising approach" to psychological operations may be applicable in many situations. However, we must be certain that we do not mask possible psychological victories by completely stereotyping our propaganda techniques and policies to those that have proven to be successful on Madison Avenue. No one can doubt the success of religious propaganda, whereby Christianity has been spread throughout the world; yet, missionaries have readily damned pagan beliefs, condemned non-converts to the everlasting fires of hell, and forthrightly stated that conversion was their ultimate goal. These are certainly not accepted advertising

techniques but they have worked and are still working today in some parts of the world.

Another type of propaganda, revolutionary propaganda, has also been very successfully used; particularly so by the communists in the past twenty years. Generally, the proponents of revolutionary propaganda are careful not to attack the people themselves but attack existing political systems and the leaders that are enforcing them. Here again, this approach is somewhat at odds with both the advertising and religious approaches.

The point to be made is that psychological operations should be specifically tailored to the problem at hand and not necessarily patterned on any one method or technique nor on any combination of them. There may be occasions when some of the techniques used by the missionaries can be effective; particularly, when we are dealing with superstitious or very "backward" people. On other occasions it may be our desire to foment revolution; e.g., in Cuba today. However, the techniques and policies that are applicable to one situation may be totally inappropriate in another. We cannot devise a "standard operating procedure" for psychological operations as a whole. Any stereotyped plans or methods of operation will almost surely detract from the overall success of our propaganda efforts.

We have agreed that the administration of the U. S. psychological operations should not necessarily be relegated to the advertising giants of Madison Avenue. The

techniques that they have developed will certainly be a help, as will some of the ones that have been used by missionaries and revolutionaries. Although, psychological operations is an entity unto its own and is not meant to be defined as a function or subset of any other form of mass communication, there do exist some analogies. We shall now discuss those that will be important in the model to be presented in this paper.

The Definition of the Product

One of the major differences between advertising and psychological operations is that in psychological operations there is no clearly defined product. One can see, feel, or taste a newly marketed brand of toothpaste; however, such "products" as allegiance, loyalty, or willingness to bear arms in defense of one's country defy animate description. One cannot drink a pint of allegiance or squeeze a tube of loyalty. However, there are some ways in which the nebulous concerns of a governmental power can be defined so that they might be treated as products.

We might proclaim a governmental chief in a manner similar to that which is used in the campaigns of many of the politicians in this country today; that is, sell the man and we will sell the ideology he represents. This method of defining the product may be a good one if we have a leader with whom the people desire to identify. The defeat of the Huks in the Phillipines was largely facilitated by the charismatic leadership of Ramon Magsaysay. On the other hand, selling the man may have serious limitations. One wrong action

on the part of the leader being exalted, his demise at the expense of some insurgent power or even his death may greatly diminish the effectiveness of a propaganda campaign.

A second way to define the product is essentially the converse of the first. That is, we publicize a public office as the embodiment of a certain ideology. (In Thailand, the King might well be the "product".) In this way, we allow for the contingencies that may befall the man currently holding office. (If the present king should die a new king would take his place.) This means of defining the product does not have the inherent drawbacks of the first method. However, the product may be weaker in the sense that many of the people will not personally attach themselves to an office in the same manner in which they would a man.

Nationalism, national unity, and heritage can all be loosely defined as "products" in certain situations. Naturally, these products would not be of much benefit in Russia or Communist China. They would also be of limited benefit in divided countries like Vietnam or Korea since national unity is one of the terms that the communists use in their attempts to instigate revolution. However, in a country like Thailand, where there exists a comparatively contiguous population and relatively strong central ties, a product such as national unity may be salable.

One "product" that can be used in virtually any environment is that of freedom. It could be defined differently for each target area of our concern. In Russia we might define it as freedom of choice, freedom to speak and write as one

desires, etc.; whereas, in the underdeveloped countries we would define it in terms such as freedom from hunger or freedom from disease. The major consideration in using "freedom" as a product is that of making it believable. Advertising that a doctor will be placed in every village may be as unbelievable to a Vietnamese peasant as would be a presidential candidate in the United States promising a Cadillac for every man over eighteen.

Hate, if properly directed can also be a very effective product. It was most certainly used in this country during the Second World War to foster an American antagonism against the Germans and Japanese. Hitler used it in his rise to power, by attempting to focus the hatred of the German people on the Jewish race. Today, hate is one of the major propaganda products being used by the many militant groups that have formed in the United States. We may ask ourselves the question; How much sooner would the war in Vietnam end if we were able to instill in the U.S. and South Vietnamese peoples a true hatred for the Viet Cong?

Thus far, we have not considered the "products" or "counter-products" that are being "sold" by the enemy. We can be certain that he will do all in his power to publicize every governmental shortcoming (whether real or imagined), mistake, or action that can in any way be construed as one that will be displeasing to the populace. If a leader is proclaimed as the embodiment of certain ideals, the enemy will try to counter by magnifying any defects in

his character or mode of operation. Normally, it will not be to the best interests of the government to discredit enemy propaganda by public denials. It is often better to simply ignore it than it is to re-publicize it in an attempt to explain, qualify or deny enemy accusations.

The enemy may also use assassination or other terrorist techniques as propaganda tools. If the government of a country is fortunate enough to have a particularly strong leader it may be to the advantage of the enemy to assassinate him. The initial hatred that is provoked may be counterbalanced by the loss of leadership to the country. Further, a feeling of fear and insecurity will often permeate a country where there is widespread use of terrorist tactics. The central government may be hardpressed to counter insurgent psychological operations of this nature. Generally, it is not sufficient for the government to claim that better protection for the people is on the way. When people are being bombed or burned out of their homes they want immediate protection, not promises.

We have by no means exhausted the list of possible propaganda products but have merely selected some of the more important ones. In waging any psychological war there will generally be a number of propaganda themes that can be sufficiently well-defined to allow their use as products in the model presented in this paper.

The Target Audience

Marketing organizations within the United States are dealing with a comparatively homogeneous audience; whereas, psychological operations will often be conducted against highly diverse populations. The variation in the effect of a promotion slogan used in Southern Florida and Northern Washington State (over 3500 miles apart) may be negligible in comparison with the expected variance between two Vietnamese villages only a few miles apart. (The converse might also be true if we were considering the difference between Brooklyn, New York, and Jackson, Mississippi.) It is for this reason that we must be particularly careful in defining the various segments of a target audience to insure that the demographic, social, and economic groupings we have selected are the ones that are most applicable to the situation. We must consider the mores, beliefs, taboos, sensitivities, education, allegiances and leadership of all ethnic, religious, cultural or any other groupings that may exist within the target country.

One U. S. advertising firm subdivides the U. S. population into a number of demographic groupings, many of which overlap. It is then possible for them to select primary and secondary target audiences for each advertising venture. This type of subdivision of target audiences will be even more important in psychological operations in that there is normally a greater diversity in the population. The following are included in their breakdown of the U. S. population:

1. Total population (children, teens, adults).
2. Teens by sex.
3. Age (18-24, 25-34, 35-49, 50-64, over 65).
4. Occupation (Prof. & Tech., Unskilled, Farm, etc.).
5. Income (under \$3000.00, \$3000.00-\$5000.00, etc.).
6. Size of county (less than 5000 people, 5000 - 10,000 people, etc.).
7. Region (New England, Metropolitan New York, Middle Atlantic, etc.).
8. Size of family.

Each of the above categories is defined for men, women, and "ladies of the house" who are treated as a separate entity since they are quite often the prime audience for advertising campaigns. It should also be noted that the number of people in each of categories (4) through (7) are the same.

For psychological operations we can transform this breakdown into a useable form by establishing different sub-categories: e.g., the salary breakdown in category (5) would be almost meaningless in most of the underdeveloped countries since the greatest plurality of the people would be in the "under \$3000.00" category; there would be no need for the separate classification "ladies of the house"; etc. Further, we would need to add other categories to the list to represent special considerations indigenous to the target country such as:

1. Religion (Catholic, Buddhist, etc.).
2. Race (Vietnamese, Chinese, etc.).
3. Political loyalties.

When we appeal to a target audience we are eliciting their support for some ideology. We may be asking for their active support, in the form of intelligence or paramilitary help, or merely soliciting passive support or non-interference. However, one thing that we can be certain of is that our enemies are just as active in this battle for the hearts and minds of the populace as we are. In many ways, the central government of a country is at a distinct disadvantage: the insurgent can promise the better way of life but the central government must show that it coming about; the insurgent can use terrorist and agitation tactics with relative impunity as compared with the probable results of any governmental "strong arm" measures; as the "underdog", the insurgent elicits much pity and support that is not given the government. Another problem that is particularly prevalent in the underdeveloped countries is a desire for growth accompanied by an unwillingness to accept growing pains. This point is well constructed in Millikan and Blackmer's book, The Emerging Nations:

"The mass media, bringing news and views of the world to illiterates in their urban slums and remote villages, introduce a new element into the process of modernization. People learn for the first time about the world outside their immediate environs, and their sense of life's possibilities begins to expand... One danger is that people will learn the fashions of popular participation long before the institutions of representative government are properly functioning. Then pseudo-participation takes command; that is, plebiscites that offer the form of public election without its substance, mob politics-of-the-street in which 'popular will' can destroy people and property without constructing better public policy. When exposure to the mass media overstimulates a people to this point, the leadership is pressed to give radio propaganda primacy over political economy. While

oratory resounds, development is likely to be shunted to the side and growth impeded. The result, for people led to impose demands which their transitional society cannot yet supply, may be a potentially explosive and spreading sense of frustration." 24

Our discussion of the target audience is purposefully general in nature. Those who are structuring specific psychological operations will need to explore the underlying considerations that make certain segments of the population better target audiences than others. Such considerations as the primary user of the "product" (e.g., It will be more important to insure that city dwellers understand that urban redevelopment programs are on the way than it would be to inform the inhabitants of the rural areas.) will help in identifying the target audiences that we most desire to reach. An initial breakdown of a country into demographic, economic and social groupings will simplify the problem of pinpointing specific target audiences for each propaganda theme that is to be used.

Measures of Success

Measuring success in psychological operations is much more difficult than its advertising counterpart. In advertising, a newly-marketed product costs X dollars to produce and promote, sells for Y dollars; hence, nets a profit of $Y - X$ dollars for each item sold. Profit goals, minimum number of years to obtain payback of investment, and other measures can be used as constraints in a study as to whether or not a particular product is to be marketed. In psychological operations we are most assuredly concerned with dollars but cannot use dollar profits as a measure of success. However, there are parallels between measuring success in a psychological

operation and measuring it in an advertising campaign. In a psychological operation:

1. Profit, though measured differently, is to be maximized.
2. Maximum advertising exposure is to be obtained (We are assuming that overexposure cannot occur.)
3. Both long run and short run goals should be established.
4. Real or imagined superiority of our "product", in comparison with other complementary "products" on the market, should be established.

One problem area that is not present is psychological as compared with big business operations is that of monopolistic practices. Big business must pay heed to anti-trust legislation; whereas, in psychological operations, a monopoly on the "hearts and minds" of the target audience is the desired result.

For the model presented in this paper we have simplified the problem of obtaining a measure of success. We do not attempt to measure the effectiveness of psychological operations as a whole. Rather, we only determine the number of people in each demographic, social, or economic grouping who are exposed to our propaganda and the number of times that they are exposed (termed frequency of exposure) over specified time intervals. This sub-optimization is still an important problem and is much more readily solved than would be an attempt to determine the overall effects of a propaganda campaign.

At the beginning of a propaganda campaign we will probably not have access to sufficient data regarding the number of people in each target audience segment who will have the physical opportunity of receiving a message. Hence, some methods need to be devised to effectively sample a population to determine these values (exposure ratings), by demographic, social, and economic groupings, for each type of media that we intend to use.

In 1964, Dr. Paitoon Cruagao, of the Asia Services Company Limited, conducted a study into the village channels of communication in Northeast Thailand. This method, along with comments appropriate to this paper, is described below:²⁷

1. Select hamlets, villages or some other groupings that are representative of various degrees of isolation. (This selection is stated in terms of isolation for simplification. A better way to determine the representative groupings might be to weight a combination of variables such as literacy rate, governmental support, insurgent support, isolation, etc.)

2. Divide the sample groupings into the demographic, social, and economic elements that we have determined to be of primary import. (These elements would be the ones discussed in the previous section on defining the target audience.)

3. Select random samples from each demographic, social and economic element that are large enough to insure significant results. (The level of significance specified

will normally be determined by such practical considerations as the time allotted to collect and process the data, the difficulty in obtaining the data, etc.)

4. Utilize pretested questionnaires and any other meaningful methods to determine the primary and secondary channels of communication within each demographic, social, and economic element. (By "channels of communication" is meant the means by which people receive information; e.g., a primary channel of communication might be newspapers whereas a secondary channel could be the husband telling his wife what he had heard during the day.) In Dr. Cruagao's study, "...Information was obtained through a pre-tested questionnaire; special interviews with priests, puyaibans, teachers, government officials and other leaders; and observation."

5. Extend the data obtained for each sample grouping to develop the exposure ratings for each media vehicle.

The initial data that would be obtained by using this approach could be less than satisfactory. One major reason for this is that in the first survey conducted within a country the exposure rating of the various media would usually be determined as a function of how the people were receiving general news and information; whereas, in follow-up surveys we would determine these ratings as they related to specific propaganda themes. Then, predicted exposure ratings could be compared with actual ratings and discrepancies noted. Thus, through successive surveys we could improve the overall reliability of our estimations.

In this chapter we have discussed some means of overcoming the difficulties inherent to defining a product, dealing with a diverse target audience, and measuring success in psychological operations. Next, we shall discuss the communication process and specify advantages and disadvantages in using each of the various types of mass media.

CHAPTER III

COMMUNICATION AND THE USE OF MASS MEDIA

"The use of mass psychoanalysis to guide campaigns of persuasion has become the basis of a multimillion dollar industry. Professional persuaders have seized upon it in their groping for more effective ways to sell us their wares -- whether products, ideas, attitudes, candidates, goals, or states of mind.²²

To develop an understanding of what is referred to above as "mass psychoanalysis", we must first look at the basic communication process; then, we can discuss the varying effects and interactions between the different types of mass media.

The Communication Process

Functionally, communication is composed of a source, a message, and a destination. The source can be an individual or an organization such as Radio Free Europe. The message can take any form that is capable of being interpreted in a meaningful manner. We define the form that the message takes as the signal. In one case it may be ink on paper; in another, it could be something as simple as the V for victory sign that was used during the Second World War. The destination is always individuals who may be alone or in groups such as lecture, radio or newspaper audiences.

The communication process can be represented schematically as shown in Figure I. In electronic communication, the encoder would be a microphone and the decoder an earphone. In human communication, the source and encoder would be one

Figure I

The Communication Process

person, the signal would be the language spoken, and the person being spoken to would be the decoder and destination.

All psychological operations involve the communication process. This is obvious when referring to transmitted propaganda messages. However, it is equally true in the case where actions or demonstrations are conducted to reap psychological gains. The protest marches conducted by the late Dr. Martin Luther King, Jr. can be construed as a type of psychological operation. Yet, if these marches had been performed in the desert, and if they had been unpublicized (i.e., not communicated to the public), then they would probably have been ineffective. Thus, the communication process can be no more effective than its weakest link permits:

1. The source should have sufficient, believable, and understandable information.
2. Encoding should be complete, accurate and transmittible.
3. Transmission needs to be timely and undistorted, irrespective of attempted interference.
4. Decoding must correspond exactly to the encoding.

5. The destination must be capable of producing the desired result.

Hence, for a communication process to be successful each of its components must be highly reliable. For example, if each component of a communication process was ninety per cent reliable (i.e., ninety per cent of the information from the source would be sufficient, believable and understandable; ninety per cent of the time the encoding would be complete, accurate, and transmittible; etc.); then, the overall reliability of this communication process would be 59.05 per cent, (the product of the individual reliabilities). This figure may seem low, but when we consider the many variables that affect the communication process we begin to realize that one may be doing well if he can keep reliability above the fifty per cent level.

As we discussed in the previous chapter, feedback from the target audience is necessary to effectively measure the reliability of a communication process. In the case of what we shall term "face-to-face discourse", the problem of feedback is greatly simplified in that we can see the expressions of our audience and can hear their grumbles or assenting applause. On the other hand, feedback is not as readily obtained from mass communication forms such as radio, newspapers, etc. In these cases, one cannot see the target audience to obtain immediate reactions. However, the overall success of our communication can sometimes be inferred by determining the number of people that "tune in" on the media that we are using. If we are using radio broadcasts and find

that our radio audience has diminished by 100,000 people we would infer that something has gone wrong with our communication. It would then be necessary to determine which "link in the chain" is weak. For example, in the Korean War, the Communists seized Seoul and confiscated all radio receivers, even though they had control of Seoul radio station, the most powerful one in the area. In this way, they denied free world radio communication to all but the brave few who had satisfactorily hidden their receivers. (It should be noted that this was done at the expense of losing their own capability to use radio in transmitting communist propaganda to the South Koreans.) In this example, the "weak link" was determined to be maximal interference (the confiscating of the radios). Therefore, we might have improved our communication with the South Koreans by intensifying the use of some other communication media such as leaflets.

No matter how primitive or oppressed a society is, there will normally be more communication presented to it than can possibly be received by everyone. We can only listen to one radio station at a time and can only read so much material in a day. If we assume that man has some choice in selecting the offerings of mass communications, we can define,

$$\text{Selection Coefficient} = \frac{\text{Expectation of Reward}}{\text{Effort Required to Receive Message}}$$

where both the expectation of reward and the effort required are scaled on the interval 1 - 100. This selection coefficient will vary from person to person and from one target audience to another. Hence, communicators (propagandists, of

course included) should attempt to make it easy and beneficial for a target audience to "tune in". That is, they want to decrease the effort required to receive a message and increase the expectation of reward that will accrue from having received it. The problem of increasing the expectation of reward is primarily one of message content. We shall not discuss it further since the model to be discussed in this paper considers message content as a constant. On the other hand, decreasing the effort required to receive a message is highly dependent on the media used to propagate it. (As was mentioned in the example regarding the Korean War, the effort required to receive a message by radio was great whereas it might have been considerably reduced by using another type of media.) For this reason, we shall discuss the types of mass media in some detail.

The Mass Media

Numerous studies have been conducted to test the effects of the various forms of mass media on the understanding and retentive capabilities of a target audience. Such studies and experiments should be interpreted carefully. Laboratory tests may suggest that television is the most effective means of electronic communication. However, this result would prove to be virtually meaningless if the "real world" audience with which we wished to communicate had different characteristics than the "test" audience; or, in the extreme, if there was only one television set per million people in the "real world" audience. The point to be made is that laboratory results do not necessarily reflect "real world"

happenings. There is no hard and fast set of rules to govern choice of media. The attributes and drawbacks of the various forms of mass media will take on different values for different target audiences. For instance, depth of treatment is considered to be one of the attributes of print, but this "attribute" would be of minimal import if the target audience was illiterate. Hence, the general considerations of each form of mass media discussed below should be interpreted liberally.

Face-to-Face Discourse

Almost all studies on the subject of advertising or psychological operations are in agreement that face-to-face discourse is the most effective individual instrument of persuasion. The following psychological advantages are considered to be the primary reasons for its success:

1. It is more casually engaged in and will often attract an audience that would not trouble itself to receive the same information by other forms of mass communication.
2. The perpetrator of face-to-face discourse can mold his manner of presentation to suit a particular target audience. In this way, he can largely reduce resistance to his message.
3. By expressions of pleasure or displeasure, the target audience can be rewarded or punished for their reaction.
4. The source of face-to-face discourse may be a trusted or intimate friend of the target audience from whom information is believable; e.g., a clergyman.

5. It is sometimes possible to accomplish objectives without first instilling conviction. For instance, if the leader of a local young men's organization tells its members to sign up for service in the militia, some may join just to keep from discrediting themselves in the eyes of their leader.

We recognize that there are many cases when face-to-face discourse is not a practical method of communicating with a target audience. It would hardly be worthwhile for the United States to try to infiltrate men behind the "Iron Curtain" or into Communist China to start a program of face-to-face confrontations on the evils of communism and benefits of "free world" life. The costs would be great and the gains comparatively small. The Nationalist Chinese have on occasion attempted to infiltrate men into the mainland of China to instigate dissatisfaction in the populace. In every recorded case they have been captured almost immediately upon entering the country.²³ (We pre-suppose that the people of Communist China are more afraid of the consequences of not reporting an intruder than they are willing to chance a possibility of bettering their way of life; that is, the expectation of reward is negligible as compared to the effort required.)

Face-to-face discourse may also be considered to include the spectrum of discussions that take place daily throughout the world. Tests have shown that casual conversations, as differentiated from formal addresses, are

potentially more influential than any form of formal communication.²³ For this reason, the proponents of a propaganda campaign should be careful not to alienate any major faction of the target audience, for the initial harm done could be greatly magnified through dissemination of discontent from that portion of the target audience alienated.

Radio

In the recent past, radio has proved to be an efficient means of mass communication to various target audiences. In the field of psychological operations, Radio Free Europe and The Voice of America have been broadcasting for years in an effort to "educate" peoples of the Communist world. The advantages of radio include:²

1. The number of people that can be reached at one time is usually large.
2. The propagandist can gain a nation-wide audience by using networks or by increasing the power of his transmitter. He can also pinpoint a specific target audience by properly establishing a low-power transmitter.
3. Audience selectivity can also be gained by scheduling at different times and by use of different types of radio programs.
4. It has a special persuasive quality as a companion, a friend, and a prime source of information for the listener.

When we consider the use of radio in communicating with a target audience we should not only be concerned with the present density of radios within the population. We should also project the costs and benefits that would accrue if we were to distribute radios to members of the population. In some cases it may be more cost-effective to give ten or twenty radios to every village within a country than it would be to attempt to communicate with the people by any other means. Of course, if we are considering giving away radios we must also consider that our intended audience may, in fact, use the radios to tune in on our enemies.

Print

The printed word, whether it be in the form of newspapers, magazines, leaflets, or any other form, has distinct advantages over the other types of media. The primary ones are:²³

1. The reader is able to pace himself as he desires. He can ponder over important points and skip those that hold no interest for him.
2. Printed matter remains available for the reader to peruse for months or even years after the initial reading.
3. Difficult or complex topics can be treated in depth for the reasons given in (1) and (2) above.
4. It is possible to specialize appeals by utilizing the knowledge that certain people read particular

types of magazines or sections of the newspaper.

5. Print may have greater prestige than the other forms of mass media. This is attributed to the fact that it is one of the oldest of the mass media and that print and "culture" have been traditionally associated.

A recent radio advertisement stated, "Montaigne once wrote, 'What do we do about those people who will not believe anything unless they see it in print?'" The advertisement went on to give the answer, "Print it, of course." As one might guess the advertisement was for a printing and lithographic company. However, it is probably true that some of these people who will not believe anything unless they see it in writing, will believe anything that is written.

When planning the use of print, we must take into account the literacy of the target audience. (The fact that a certain audience may be illiterate may not negate the use of print but it will certainly affect the amount of pictorial or symbolic material required.) We also need to consider the ease of dissemination. If we control the press it will certainly be much easier to reach the people than if we have to rely on covert publications or leaflet drops.

Screen

When we consider the use of screen, television or movies we are implicitly assuming that our audience is indigenous to a country in which we have some degree of

control. The present state of the art in television is such that signals cannot be projected satisfactorily over great distances without a purposeful receiving station in the proximity of the target audience. Further, a television signal is considerably easier to "jam" and the prevalence of television sets in the areas of the world that are of major concern in our propaganda efforts is low. Likewise, there is little opportunity to show movies favorable to the "free world" in such countries as Cuba, Russia or Communist China. Hence, the benefits that we ascribe to the screen are greatly diluted by the opportunity for its use. The benefits are:²

1. Concrete visual material is presented.
2. Recall of what has been seen is generally excellent.
3. Children are particularly impressed by what they see.

Interactions Among Mass Media

Almost every propaganda campaign will include the use of more than one type of media to communicate with the target audience. If the target audience receives the same message by more than one medium his belief in what he is receiving will normally be fortified. However, if different messages relating to the same incident or different interpretations on a particular propaganda theme are received via two different media; then, the target audience becomes confused, probably believes neither message,

and loses some faith in both media. Credibility is hard to establish initially, but virtually impossible to re-establish once it is lost; hence, a cardinal rule for the use of mass media is to be consistent in all communication.

Thus far in this paper the stage has been set to present a model that can be used in optimizing allocation of the various forms of mass media. We have discussed how the product, target audience, measures of success and forms of mass media can be characterized in psychological operations. In the next chapter, we shall describe the formulation of the model and present an application of its use in psychological operations.

CHAPTER IV

PROBLEM FORMULATION AND DEVELOPMENT

OF A GOAL PROGRAMMING MODEL

In this chapter we shall formally set forth the problems that face the decision maker who is attempting to optimize a media mix for a given psychological operation. Then, a "goal programming" model (which closely parallels one that was developed for marketing by A. Charnes, W. W. Cooper, J. K. DeVoe, D. B. Learner and W. Reinecke³⁰) will be presented that will allow determination of the "best" possible use of available media subject to specified budget restrictions, resource limitations and desired levels of achievement with respect to each target audience of concern.

Problem Formulation

The overall problem that is addressed by the model to be presented is that of staying within a fixed budget while at the same time subjecting to propaganda those people whom we specifically desire to receive a message a given number of times in certain time periods. This is a complex problem and we will approach it by subdividing it into a number of interrelated problems, the intersection of which is equivalent to the original problem. Then, by formulating a method to solve concurrently this set of problems we will guarantee solution to their intersection, the original problem.

Before stating the subdivisions chosen, it is well to summarize the information that should be obtained as data inputs to the model. We will need to determine:

1. The most representative groupings into which the total population of a country can be divided.

2. The number of people in each of these groupings.

3. The geographic subdivisions that are most representative of a country.

4. The density of each grouping in each of the chosen geographic subdivisions.

5. The primary and secondary means by which each grouping receives information.

6. The media that are available internally and externally for use in the country of concern.

7. The cost per publication, broadcast, etc.

8. How often and when each medium is presently used.

9. How often it is possible to use each medium.

10. The savings that accrue through larger purchases of each type medium.

11. The breakdown, by grouping, of the number of people that are subject to transmissions of each possible medium.

12. The budget restrictions that exist.

13. Any special commitments that require use of certain media a specified number of times.

Once this data has been obtained the planners for the psychological operation can structure a set of goals, the simultaneous attainment of which is their objective. To be more precise, the problem as originally stated is subdivided into one of minimizing the variance, subject to a given budget, between goals stated with respect to specified target audiences over both time periods and time intervals (e.g., three monthly time periods make one quarter-year interval). Further, the goals, themselves, can be formed with respect to the total number of times members of a given target audience are to be subjected to propaganda, the percent of each target audience that is to be subjected, and the distribution of the frequencies of subjection. However, in order to simplify the formulation of the model we will develop it with respect to one target audience.

As one may surmise, it will be quite possible to form a set of goals that cannot be simultaneously satisfied, i.e., there might not be a feasible solution to the problem. In these cases, as will be shown, a "best possible solution" is obtained by minimizing the variance from the stated goals, i.e., by "goal programming".

The first step in developing this goal programming model will be to define and quantify methods by which goals can be represented as linear constraints. Specifically, a means of representing the gross target audience, the net target audience and the distribution of times that members of the net target audience are subjected to propaganda will be presented. Then, we shall demonstrate the use of goals and

other constraints, such as budgetary limitations, in forming a goal programming model. Finally, a numerical example will be given.

The Gross Target Audience

During time period t , we might choose to transmit propaganda several times over a given medium. This choice may be represented by the decision variable $x_{jk}(t)$, which would take the value $x_{jk}(t) = 1$ if we chose to use medium j exactly k times during time period t , and would have the value $x_{jk}(t) = 0$ otherwise. To simplify the linear programming techniques required, the restriction on the $x_{jk}(t)$ can be approximated by requiring

$$\sum_k x_{jk}(t) \leq 1 \quad (1)$$

where

$$x_{jk}(t) \geq 0 \quad .$$

Suppose that we elect to use the j^{th} medium k times in time period t ; i.e., $x_{jk}(t) = 1$. If U is the set of N people representing our target population, then this decision would mean that a subset $u_{j1}(t)$ of $n_{j1}(t)$ people in our target population would be exposed to the propaganda the first time we used the medium, a subset $u_{j2}(t)$ of $n_{j2}(t)$ people would be exposed the second time we used the medium, and a subset $u_{jk}(t)$ of $n_{jk}(t)$ people would be exposed the k^{th} and final time we used the medium in period t . Note that these subsets are not disjoint, in that a given individual may be subjected to propaganda 2, 3, or possibly k times by medium j during time

period t . We define

$$d_{jk}(t) = \sum_{i=1}^k n_{ji}(t)$$

as the total number of exposures from medium j in time period t resulting from our decision to set $x_{jk}(t) = 1$. For example,

$$d_{34}(6) = 25,000$$

would imply that by propagating medium three (say, National Magazine), four times in a six-month period, we would subject to propaganda 25,000 members of the target audience, (say, men aged 20 - 25).

The gross target audience for time period t , $D(t)$, is defined as the number of exposures to propaganda by all media in the time period, and can be represented by

$$D(t) = \sum_j \sum_k d_{jk}(t) x_{jk}(t) \quad . \quad (2)$$

For example, the matrix

$$\begin{aligned} \left\| \left\| d_{jk}(t) \right\| \right\| &= \begin{bmatrix} d_{11}(t) & d_{12}(t) \\ d_{21}(t) & d_{22}(t) \end{bmatrix} \\ &= \begin{bmatrix} 200 & 300 \\ 250 & 350 \end{bmatrix} \end{aligned}$$

would imply that in time period t , 200 people would be subjected to propaganda by one transmission of medium 1, 300 people would be subjected to propaganda by two transmissions of medium 1, etc.

Likewise,

$$\begin{aligned} \left\| x_{jk}(t) \right\| &= \begin{bmatrix} x_{11}(t) & x_{12}(t) \\ x_{21}(t) & x_{22}(t) \end{bmatrix} \\ &= \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix} \end{aligned}$$

would imply that in time period t , medium 1 was utilized exactly twice ($x_{12}(t) = 1$) and medium 2 utilized exactly once ($x_{21}(t) = 1$). Hence, the total gross target audience subjected to propaganda by media 1 and 2 during period t would be

$$\begin{aligned} D(t) &= \sum_{j=1}^2 \sum_{k=1}^2 d_{jk}(t) x_{jk}(t) , \\ &= (200)(0) + (300)(1) + (250)(1) + (350)(0) , \\ &= 550 \text{ people.} \end{aligned}$$

It is noted again, that gross target audience is determined without regard to duplication. Hence, in the above example there are not necessarily 550 different people subjected to propaganda.

The Net Target Audience

We have seen that if we use the j^{th} medium k times during the t^{th} time period ($x_{jk}(t) = 1$), the total number of exposures is given by

$$d_{jk}(t) = \sum_{i=1}^k n_{ji}(t) .$$

The actual number of people, $N_{jk}(t)$, subjected to propaganda at least once by medium j during period t will be the number

of people in the union of the sets; $u_{ji}(t)$, $i=1,2,\dots,k$.

Let $r_{jk}(t)$ be the proportion of the target audience U (of size N) that is subjected to propaganda at least once from medium j during time period t . Then,

$$r_{jk}(t) = \frac{N_{jk}(t)}{N},$$

and we can compute

$$1 - r_{jk}(t) = \prod_{i=1}^k \left(1 - \frac{n_{ji}(t)}{N}\right)$$

or

$$r_{jk}(t) = 1 - \prod_{i=1}^k \left(1 - \frac{n_{ji}(t)}{N}\right).$$

We define the net target audience, $N(t)$, as the total number of people in the target audience, U , that are exposed to propaganda by any medium at least once during time period t . The proportion of the total target audience subjected to propaganda at least once in period t is

$$R(t) = \frac{N(t)}{N}$$

and, if we assume the $r_{jk}(t)$ to be independent and require $x_{jk}(t)$ to conform to (1) for each t , it can be computed by

$$1 - R(t) = \prod_{j,k} (1 - r_{jk}(t))^{x_{jk}(t)} \quad (3)$$

where $(1-R(t))$ is the proportion of the total target audience that is not subjected to propaganda during period t . Using the example mentioned earlier, if out of a total target audience, 80 per cent are subjected twice to medium 1 and 60

per cent subjected once to medium 2 during period t , then

$$\begin{aligned}
 1 - R(t) &= \prod_{j=1}^2 \prod_{k=1}^2 (1 - r_{jk}(t))^{x_{jk}(t)}, \\
 &= (1 - r_{11}(t))^0 (1 - 0.80)^1 (1 - 0.60)^1 (1 - r_{22}(t))^0, \\
 &= 0.08
 \end{aligned}$$

which indicates that 92 per cent of the total target audience is subjected to propaganda at least once, by media 1 and 2, during time period t .

To convert (3) into a form compatible with linear programming we utilize logarithms to obtain :

$$\ln(1 - R(t)) = \sum_j \sum_k \ln[1 - r_{jk}(t)] x_{jk}(t). \quad (4)$$

Distribution of Frequencies

One means of dealing with the problem of estimating the number of times a target audience is subjected to propaganda is to use average frequency (gross target audience divided by net target audience). A drawback to this approach is that it denies the ability to pinpoint that proportion of a target audience that is subjected to propaganda a specific number of times. However, there is a method which was developed for use in advertising that makes use of the log-normal distribution as an approximating device for estimating an entire distribution of frequencies.³³ This same method can be applied in psychological operations.

Let $H_s(t)$ be the proportion of the net target audience that is subjected to propaganda s or more times in period t .

Thus, if Figure II represents the frequency diagram for a given net target audience, we see that

$$H_1(t) = 1.0 \quad ,$$

$$H_2(t) = 0.60 \quad ,$$

$$H_3(t) = 0.40 \quad ,$$

etc.,

which implies that for the net target audience represented, 40 per cent are subjected to propaganda exactly once, 20 per cent exactly twice, etc.

Figure II

Sample Frequency Diagram

As we previously stated, the log-normal distribution is considered a sufficiently accurate representation of the distribution of frequencies. Let $\mu^*(t)$ and $\sigma^*(t)$ be the mean and standard deviation of the log-normal distribution, and let $\mu(t)$ and $\sigma(t)$ be the mean and standard deviation of the associated normal distribution. Then

$$\mu(t) = 2 \ln \mu^*(t) - \frac{1}{2} \ln [\sigma^*(t)^2 + \mu^*(t)^2]$$

and

$$\sigma^2(t) = \ln[\sigma^*(t)^2 + \mu^*(t)^2] - 2 \ln \mu^*(t) \quad .$$

However, experimentation has shown that these exact relationships between the parameters of the normal and the log-normal distributions should be replaced by suitable approximations.³⁰

Let A_m , B_m , C_m , D_m and E_m be parameters whose values would either be estimated empirically or approximated for each type of m types or combinations of media. Recalling that N is the total number of people in a specific target audience and defining $P_j(t)$ to be the proportion of the target audience subjected to propaganda by the first transmission of medium j , then

$$P_j(t) = \frac{d_{j1}(t)}{N}$$

and we may write expressions for the relationships between the mean and variance of the normal and log-normal distribution as³³

$$\mu(t) = A_m + B_m \sum_j \sum_k P_j(t) x_{jk}(t) + C_m \sum_j \sum_k k x_{jk}(t)$$

and

(5)

$$\sigma(t) = D_m + E_m \sum_j \sum_k k x_{jk}(t) \quad .$$

In the above expressions, $\sum_j \sum_k P_j(t) x_{jk}(t)$, represents the proportion of the target audience that is subjected to propaganda by all first transmissions and $\sum_j \sum_k k x_{jk}(t)$ counts the total number of times propaganda is transmitted by all media.

Correspondence with the discrete distributions is obtained by the expression

$$Z_{(1-H_s(t))} = \frac{\ln(s-F_m) - \mu(t)}{\sigma(t)} \quad (6)$$

where Z is the studentized normal variate, $N(0,1)$, and F_m is another parameter whose value is determined empirically for each of m types or combinations of media. Now, since Z is the fractile associated with $1 - H_s(t)$ for $N(0,1)$, we can substitute the values of $\mu(t)$ and $\sigma(t)$ from (5) into (6) to obtain

$$Z_{(1-H_s(t))} = \frac{\ln(s-F_m) - A_m - B_m \sum_j \sum_k P_j(t) x_{jk}(t) - C_m \sum_j \sum_k k x_{jk}(t)}{D_m + E_m \sum_j \sum_k k x_{jk}(t)} \quad (7)$$

Specification of Goals

Goals can be formulated with respect to both the gross and net target audience. If it is desired that the gross target audience for period t be at least $L(t)$ people, then from (2) we can require

$$D(t) \geq L(t)$$

or equivalently

$$\sum_j \sum_k d_{jk}(t) x_{jk}(t) \geq L(t) ,$$

where the values of $L(t)$ will be varied to account for seasonal limitations or other environmental factors that make the desired goals in time period one different from those in some other time period. In addition to our time period constraints we can also specify goals for specified time intervals such as requiring that the gross target audience for T time

intervals be at least $L(T)$. That is, if time periods are of length one month and T is a three month or quarterly interval, we could state the quarterly goal as

$$\sum_{t=1}^3 \sum_j \sum_k d_{jk}(t) x_{jk}(t) \geq L(T).$$

In establishing constraints or goals with respect to the net target audience we might require that the proportion $R(t)$ of the total target audience subjected to propaganda at least once in period t , $R(t)$, be greater than some prescribed percentage of the net target audience, $N(t)$; that is,

$$R(t) \geq N(t),$$

which implies

$$\ln(1-R(t)) \leq \ln(1-N(t)) .$$

Then, the linear constraint,

$$\sum_j \sum_k \ln [1-r_{jk}(t)] x_{jk}(t) \leq \ln(1-N(t))$$

is formed from (4). Once again, we could also specify constraints over selected time intervals; i.e.,

$$\sum_{t \in T} \sum_j \sum_k \ln [1-r_{jk}(t)] x_{jk}(t) \leq \ln(1-N(T)).$$

At this point, it is well to note that it may be difficult to obtain the values for all the $r_{jk}(t)$. However, those that are not known can be generated if values for $r_{j1}(t)$ and any other $r_{jk}(t)$ can be obtained. To do this we substitute the known values into

$$r_{jk}(t) = r_{j1}(t) + a_j(t) \ln(k) \quad (8)$$

and solve for the $a_j(t)$. Then, by substituting the $a_j(t)$ back into (8), the unknown values of $r_{jk}(t)$ can be obtained.³³

In stating goals for the distribution of frequencies, it could be specified that $(100)q$ per cent of the net target audience be subjected to propaganda at least q times in time period t , or

$$H_g(t) \geq q$$

which is equivalent to

$$1 - H_g(t) \leq 1 - q.$$

Then, if Z is the fractile associated with $1 - H_g(t)$ for $N(0,1)$, we can write

$$Z_{(1-H_g(t))} \leq [Z_{(1-q)} = \Phi^{-1}(1-q) = Q]$$

where Φ is the distribution function for $N(0,1)$. Now, constraints of this type can be succinctly stated by using (6),

$$\frac{(\ln(q-F_m) - \mu(t))}{\sigma(t)} \leq Q$$

or by substituting into and performing algebraic rearrangement on (7) to obtain,

$$(C_m + E_m Q)k \sum_j \sum_k x_{jk}(t) + B_m \sum_j \sum_k P_j(t) x_{jk}(t) \geq \ln(q-F_m) - A_m - D_m Q.$$

We have implicitly assumed that we have been able to determine values for the parameters, A_m through F_m . The advertising firm that is presently employing the model upon which this one is based has tried a number of approximating techniques for determining these values for each type and combination of media.³⁴ The most successful has been to generate the values A_m through E_m by using a form of linear regression to fit

$\mu(t)$ and $\sigma(t)$ to empirical data. Likewise, the value of F_m is determined so that it best fits (6) to experimental results. However, in planning psychological operations we will probably not have the data gathering resources equivalent to those available for advertising studies in the United States. Hence, the initial evaluation of the parameters A_m through F_m would be based on relatively small samples or on values that were determined appropriate for use in another operation. These initial values would need to be verified and, if necessary, updated as soon as reliable feedback is obtained.

In addition to the constraints that have been stated thus far we will also need to specify budget limitations, maximum possible or desired use of each type of media and any other special limitations that may be indigenous to the area in which we are operating.

The overall budget limitation would be

$$\sum_j \sum_k c_{jk}(t) x_{jk}(t) \leq \text{total budget}$$

where the $c_{jk}(t)$ are the costs for k insertions (where an insertion is the planting of a propaganda message in one issue, radio show, etc.) in media vehicle j during time period t and $x_{jk}(t)$ is required to conform to (1). Any special budgetary limitations, such as required expenditures on a certain type of media because of past commitments, can be translated into equations similar to equation (9).

Upper and/or lower bounds on the number of insertions in a certain class of media or in a specific media vehicle are governed by factors such as the number of issues published or

by the number of hours of radio transmissions possible in a certain time period. For instance, if we were considering a weekly newspaper we must constrain the number of insertions possible to 52 per year; that is,

$$\sum_{t \in T} \sum_k kx_{8k}(t) \leq 52, \quad t=1,2,\dots,52,$$

where the subscript, $j = 8$, refers to this specific weekly newspaper and T is one year. Similarly, if it was mandatory that at least two radio broadcasts be given in time period t , we would specify the constraint as

$$\sum_k kx_{9k}(t) \geq 2,$$

where the subscript, $j = 9$, refers to the specific radio station.

Up to this point we have confined ourselves to formulating methods of dealing with the various constraints that may be given for a certain propaganda campaign. We turn now to a branch of linear programming, termed "goal programming", as the method by which we optimize our actions subject to a set of specific constraints.⁹

Formulating the Goal Program

Basically, "goal programming" allows us to solve unsolvable problems. That is, through iterative techniques we drive our solution to a point that may not be optimal, in the true sense of the word, but is the best that we can do under the restrictions that are placed upon us. (There is no better solution than the one that is obtained.) The constraints that we shall incorporate in the functional to be formed can

be considered goals. Goals that are not attainable will generally have been established as incentive measures, methods by which accomplishments can be evaluated, or as a means of insuring that long-run objectives are not overlooked in obtaining short-run success.

In forming the "goal program" we consider three types of constraints:

First, there are those constraints which must be satisfied in the solution; e.g., budget restrictions. Normal slack vectors are associated with these constraints. For example, the overall budget constraint can be written as

$$\sum_j \sum_k c_{jk}(t)x_{jk}(t) + S_1 = \text{total budget} \quad (10)$$

where S_1 is a slack vector of the type that is normally used in linear programming.

A second type of constraint is one where a goal is specified that is attainable if considered independently of other goals but may not be attainable when considered as a member of the entire system of constraints. In this case, we allow the specified goal to be either exceeded or not reached by an amount that will allow a "best possible solution" for the entire system. For example, the budget and resource constraints may be such that it is possible to subject to propaganda at least $L(t)$ members of the gross target audience (neglecting other goals) for all t , $t=1,2,\dots,T$. Then, this constraint would be written as

$$\sum_j \sum_k d_{jk}(t)x_{jk}(t) + S_2^+ - S_2^- = L(t)$$

where the terms S_2^+ and S_2^- indicate that this goal is best satisfied by minimizing the absolute value of S_2 . (Obviously, both S_2^+ and S_2^- cannot appear at a positive level in the final basis. This fact is guaranteed by the linear independence of the basis vectors in the simplex method of linear programming.)

A third type of constraint that may enter the goal program is one that is known to be unattainable given specified budget and resource limitations. For instance, if we know that it is not possible to reach a proportion equal to $N(t)$ of the target audience for at least some t , we would state this constraint as

$$\sum_j \sum_k \ln[1-r_{jk}(t)]x_{jk}(t) - S_3^- = \ln(1-N(t)) \quad (12)$$

where S_3^- is the amount by which we miss attaining this goal.

To demonstrate the formulation of the entire "goal program" we will consider that equations (10), (11), and (12) are the goals that we have been directed to satisfy in conducting some psychological operation. We will also consider that the rather ill-defined term, "as close as possible", is satisfied by minimizing the sum of the absolute deviations of each of the goal constraints. That is, we can define a function, $d(x,y)$, to be the "distance" (or, metric) in a general vector space with properties:

$$d(x,y) \geq 0 \text{ and } d(x,y) = 0 \text{ iff } x = y;$$

$$d(x,y) = d(y,x);$$

$$d(x,y) \leq d(x,z) + d(z,y).$$

Then, the measure of the mean deviation (or ℓ_1 metric) is defined as

$$d(x,y) = \sum_j |x_j - y_j|.$$

Hence, for our illustrative "goal program" the objective function will be

$$\begin{aligned} \min. & \sum_j \left| \sum_k d_{jk}(t) x_{jk}(t) - L(t) \right| \\ & + \left| \sum_j \sum_k \ln[1 - r_{jk}(t)] x_{jk}(t) - \ln(1-N(t)) \right| \end{aligned}$$

or equivalently,

$$\min. z = S_2^+ + S_2^- + S_3^- ,$$

since each of the terms in (13) is required to be non-negative. Therefore, the entire "goal program" (neglecting any resource constraints) can be written as:

$$\min. z = S_2^+ + S_2^- + S_3^- ,$$

$$\text{S.T. } \sum_j \sum_k c_{jk}(t) x_{jk}(t) + S_1 = \text{total budget},$$

$$\sum_j \sum_k d_{jk}(t) x_{jk}(t) + S_2^+ - S_2^- = L(t) ,$$

$$\sum_j \sum_k \ln[1 - r_{jk}(t)] x_{jk}(t) - S_3^- = \ln(1-N(t)) ,$$

$$\sum_k x_{jk}(t) + S_4 = 1 ,$$

and

$$S_1, S_2^+, S_2^-, S_3^-, S_4, r_{jk}(t), x_{jk}(t), L(t), N(t) \geq 0, \forall j, k.$$

This concludes the formulation of a "goal programming" model that can be used to project the "best possible" use of available media to achieve specified objectives given budget and

resource constraints. Next, the use of the model will be demonstrated in a numerical example.

Hypothetical Application of the Model

The situation and values used in this application of the model will be fictitious; however, an attempt has been made to make them realistic. It is also noted that this example use of the model will be greatly simplified from that which would be expected to occur in actual practice in order to facilitate a better understanding of the rudimentary aspects of the model. Hence, only one target audience and two choices of media will be considered.

As a scenario, we assume that the United States was called upon by Frebia, a member of the SEATO alliance, to assist them in overcoming the first phase of a Communist-inspired insurgency. One portion of the support given by the United States was in the form of a team of advisors in the field of psychological operations. This team (which included "experts" on the political, cultural, sociological and economic concerns of Frebia) moved to Frebia and in conjunction with Frebian government officials determined that one of the major problem areas in Frebia was a lack of nationalistic spirit, especially among the young men of the country. It was decided to launch an extensive psychological operations campaign aimed at inspiring a nationalistic feeling in the men, aged 20 - 25. A budget limitation of \$11,000 was placed on this goal.

The first step in using the model presented in this paper was to define the product which in this case was determined to

be "Nationalism". Next, extensive surveying and data gathering were conducted in three villages that were representative of three degrees of isolation from the central government. From the data obtained it was determined that the two best means of communicating with the primary target audience, men between the ages of twenty and twenty-five, was Radio Frebia (a weekly radio broadcast) and National Frebian (a bi-weekly magazine). The latest census indicated that the total number of people in this target audience, N , was 70,000. Multiple regression was used to fit $\mu(t)$ and $\sigma(t)$ from (6) to the applicable data that had been obtained from the three villages. The parameters A_m through F_m were determined to have the following values for both Radio Frebia and National Frebian: (Since both were determined to have the same values, we shall drop the subscript, m .)

$$\begin{aligned} A &= 0.057 \\ B &= 0.020 \\ C &= 0.002 \\ D &= 0.015 \\ E &= 0.135 \\ F &= 0.850 \end{aligned} .$$

Next, the costs shown in Table I were obtained from the media publishers and the data shown in Table II determined from the representative samples taken in the three villages for a one month time period, $t = 1$.

Table I

Sample Media Costs

Media	j	Cost per Insertion	Max Insertions per Month
Radio Frebia	1	\$1000.00	2
National Frebian	2	\$3000.00	4

Table II

Sample Gross and Net Target Audience Data

Media	j	$r_{j1}(1)$	$r_{j2}(1)$	$d_{j1}(1)$	$d_{j2}(1)$	$d_{j3}(1)$	$d_{j4}(t)$	$P_j(1)$
Radio Frebia	1	0.25	0.43	20,000	38,000	-	-	0.286
National Frebian	2	0.40	0.55	30,000	55,000	72,000	80,000	0.429

Recall that

$$r_{12}(1) = 0.55$$

implies that the proportion of people in the total target audience ($N = 70,000$) obtained by the second transmission ($k=2$) of medium 1 (Radio Frebia) in one month ($t=1$) is 0.55 and that

$$d_{23}(1) = 72,000$$

indicates that there have been 72,000 exposures to the target audience (where obviously, some have been subjected to propaganda more than once, since $N = 70,000$) via three

transmissions ($k=3$) of National Frebian ($j=2$) in one month ($t=1$). The proportion of the total target audience subjected to propaganda by the first transmission of j in a one month period, $P_j(1)$, was found using

$$P_j(1) = \frac{d_{j1}(1)}{N} .$$

We also have sufficient data to determine the missing proportions, $r_{23}(1)$ and $r_{24}(1)$. First we solve for $a_2(1)$ in (8). Thus,

$$r_{22}(1) = r_{21}(1) + a_2(1)\ln 2$$

which, by substituting values from Table II gives

$$\begin{aligned} a_2(1) &= (0.55-0.40)(\ln 2)^{-1}, \\ &= 0.2164. \end{aligned}$$

Then,

$$\begin{aligned} r_{23}(1) &= r_{21}(1) + a_2(1)\ln 3, \\ &= 0.638 \end{aligned}$$

and

$$\begin{aligned} r_{24}(1) &= r_{21}(1) + a_2(1)\ln 4, \\ &= 0.700. \end{aligned}$$

The goals specified by the psychological operations team, as recommended by the Frebian government, are as follows.

1. The proportion of the target audience subjected to propaganda at least once during one month should be greater than or equal to 0.75. That is

$$R(1) \geq [N(1) = 0.75]$$

or, from (12)

$$\sum_{j=1}^2 \sum_{k=1}^4 \ln[1-r_{jk}(1)]x_{jk}(1) + s_1^+ - s_1^- = \ln(1-.75) .$$

2. The gross target audience subjected to propaganda during a one month period should be at least 110,000. Then,

$$D(1) \geq L(1) = 110,000$$

or, from (11),

$$\sum_{j=1}^2 \sum_{k=1}^4 d_{jk}(1)x_{jk}(1) + s_2^+ - s_2^- = 110,000.$$

3. At least 80 per cent of the net target audience should be subjected to propaganda at least three times in a one month time period. That is

$$H_3(1) \geq [q = 0.80]$$

which implies

$$Z_{(1-H_3(1))} \geq [Q = Z_{(1-0.8)} = Z_{0.2} = \Phi^{-1}(0.2) = 0.84].$$

Now, from (6) we have

$$\frac{\ln(3.0-F) - \mu(1)}{\sigma(1)} \geq (Q = 0.84)$$

so, from (7) we can write this goal as

$$\begin{aligned} (C + EQ) \sum_{j=1}^2 \sum_{k=1}^4 kx_{jk}(1) + B \sum_{j=1}^2 \sum_{k=1}^4 P_j(1)x_{jk}(1) + s_3^+ \\ = \ln(3.0-F) - A - DQ. \end{aligned}$$

Substituting in the values for the parameters A through F and Q we obtain

$$\sum_{j=1}^2 \sum_{k=1}^4 [(0.11540)k + (0.020)P_j(1)]x_{jk}(1) + s_3^+ = 0.71886.$$

Since it was possible to satisfy the first and second goals if they were considered independently but not necessarily in combination with the other goals, they were assigned plus and minus slacks; thereby, allowing the goals to be either exceeded or not reached. It was known that it was not possible to satisfy the third goal so it was assigned a positive slack to measure the difference from the stated goal. The goal program for this sample situation can now be completely formulated as shown in Figure III.

The solution to our hypothetical problem was obtained using a computerized simplex linear program. The final basis contained the following vectors at the levels indicated:

$$x_{11}(1) = 0,$$

$$x_{12}(1) = 1,$$

$$x_{22}(1) = 0,$$

$$x_{23}(1) = 1,$$

$$s_2^- = 0.1914,$$

$$s_3^+ = 0.12756.$$

Since $x_{12}(1)$ and $x_{23}(1)$ are the only $x_{jk}(1)$ vectors in the final basis at a positive level, we know that the "best possible" solution is to use medium 1, Radio Frebia, twice ($x_{12}(1) = 1$) and medium 2, National Frebian, three times ($x_{23}(1) = 1$).

The fact that s_4 is not in the final basis indicates that we spent the entirety of our budgeted \$11,000 to obtain two units of medium 1 at \$1,000 per unit and three units of medium 2 at \$3,000 per unit.

$$\text{Minimize } z = s_1^+ + s_1^- + s_2^+ + s_2^- + s_3^+$$

Subject to

$$\sum_{j=1}^2 \sum_{k=1}^4 \ln[1-r_{jk}(1)]x_{jk}(1) + s_1^+ - s_1^- = \ln(1-.75)$$

$$\sum_{j=1}^2 \sum_{k=1}^4 d_{jk}(1)x_{jk}(1) + s_2^+ - s_2^- = 110,000$$

$$\sum_{j=1}^2 \sum_{k=1}^4 [(0.11540)k + (0.02P_j(1))]x_{jk}(1) + s_3^+ = 0.71886$$

$$\sum_{j=1}^2 \sum_{k=1}^4 c_{jk}(1)x_{jk}(1) + s_4 = 10,000$$

$$\sum_{k=1}^4 x_{1k}(1) + s_5 = 1$$

$$\sum_{k=1}^4 x_{2k}(1) + s_6 = 1$$

$$\sum_{k=1}^4 x_{1k}(1) + s_7 = 2$$

$$\sum_{k=1}^4 x_{2k}(1) + s_8 = 4$$

$$s_i, i=1,2,\dots,8; r_{jk}(1), d_{jk}(1), P_j(1), c_{jk}(1), x_{jk}(1) \geq 0 \forall j,k.$$

Figure III

Goal Program for Hypothetical Situation

The constraint for the gross target audience was also exactly satisfied since its slack, S_1 , is absent from the optimal basis. This may be easily verified by substituting in the values for $d_{jk}(1)$ in the stated goal; that is

$$d_{12}(1)x_{12}(1) + d_{23}(1)x_{23}(1) = 110,000$$

or

$$(38,000)(1) + (72,000)(1) = 110,000$$

since $x_{12}(1)$ and $x_{23}(1)$ are the only $x_{jk}(1)$ vectors greater than zero.

We did not quite reach the goal concerning the net target audience since the slack, S_2^- , associated with this goal is in the final basis at a positive level. We could verify this by computing the log values for the net target audience goal; however, it is more readily demonstrated using (3); i.e., by substituting the values for $r_{jk}(1)$ and $x_{jk}(1)$ in

$$1 - R(1) = \prod_{j=1}^2 \prod_{k=1}^4 (1 - r_{jk}(1))^{x_{jk}(1)}$$

we obtain

$$\begin{aligned} R(1) &= 1 - [1 - r_{12}(1)]^{x_{12}(1)} [1 - r_{23}(1)]^{x_{23}(1)}, \\ &= 1 - (1 - 0.43)^1 (1 - 0.638)^1, \\ &= 0.72566. \end{aligned}$$

Hence, 72.566 per cent of the total target audience will be subjected to propaganda at least once, thereby missing our stated goal of 75 per cent by approximately 2.5 per cent.

We knew that we would not satisfy the goal with respect to the distribution of frequencies. The difference between the goal, computed to be 0.71886, and the value of the slack

vector associated with this goal, $s_3^+ = 0.12756$, indicates that the combination of two broadcasts by Radio Frebia and three entries in the National Frebian will net a value for $\Phi^{-1}(1-H_3(1))$ of 0.59120. This implies that approximately 28 per cent of the net target audience will be subjected to propaganda at least three times by this mix of media.

The other vectors in the final basis, s_7 at a level of zero and s_8 at a level of 1, indicate that both broadcasts of Radio Frebia but only three of the four possible entries in National Frebian were used in the optimal basis to the goal program.

This simplified example demonstrated how this "goal programming" model could be applied in "real world" situations. The problems will be much more complex and the data gathering demanding; however, the results may well lead to more proficient psychological operations.

CHAPTER V

CONCLUSIONS AND RECOMMENDATIONS FOR FUTURE STUDY

Heretofore, proponents of a psychological operation usually relied on past experience and doctrinal methods in planning and implementing a campaign. The model presented in this paper is not a substitute for experience, nor is it meant to abrogate doctrine; but represents a tool that will allow examination of many alternative courses of action in a systematic and rapid manner. Experience and doctrinal factors may readily be used as a part of the model in the form of constraints. For instance, if experience has shown that at least one-fourth of an allotted budget should go into radio, this constraint could be added to the model. Likewise, "rigid" doctrine might require the insertion of at least one propaganda message in every national magazine, which could also be stated as constraints. In addition to these constraints, the procedures outlined herein allow us to establish goals for specific target audiences. (Recall that a target audience was that segment of the population that we particularly desire to "sell" a certain "product", where the "product" was the embodiment of a propaganda theme.) The goals discussed were with respect to the gross target audience, the net target audience, and the frequency distribution of the net target audience.

Use of the model should be predicated on a complete understanding of its limitations. In actuality, this formulation is a linear approximation to a problem that may not, in fact,

be linear. That is, the objective function and all constraints are stated as linear equations (inequalities); no second, third or higher degree terms are allowed. For this reason, such factors as the reinforcing effect that propaganda transmitted by one medium may have on that transmitted by another are not accounted for. However, linear approximations are not felt to be severe departures from reality.

It should be understood that these procedures are limited to use in predicting optimal allocation of media as a function of exposure to specified groupings. In using them we can specify which people we most desire to expose to propaganda. Further, we can establish the number of times we want to reach them. However, the model will not insure that the initial selection of primary and secondary target audiences is a good one; nor will it consider the impact of the propaganda on the target audience. In other words, it could possibly turn out that the most cost effective way of reaching a maximum number of people in a country is to fly a blimp (e.g., the Goodyear blimp) up and down the country for a couple of days with symbology or slogans painted on its side, signifying that the better life was on the way. A maximum number of people may be exposed to the message on the blimp but the number who actually registered the message or who were moved by the message may have been negligible. Hence, results must be carefully interpreted prior to implementing any major policy changes. Another major consideration that is not specifically accounted for here is the size of the newspaper article, length of radio broadcast, etc.; that is, if a medium

is listed as newspaper X, the model would consider the full page advertisement the same as a one line item at the bottom of the last column. This shortcoming can be overcome within the framework of the model by a judicious choice of media; e.g., a full page advertisement in newspaper X might be medium number ten, a half-page advertisement in newspaper X could be medium number eleven, etc.

The limitations that are specified in the above paragraphs are not meant to detract from the usefulness of the model, which can provide valuable insights into media allocation problems so long as results are interpreted with an understanding of the limitations of the model. Interviews with personnel in the advertising field have indicated that in initially using the model they were reaching solutions where the most cost-effective way to reach specified audiences was by total use of radio broadcasts. (The cost per number of people reached in each target audience was much less than for any other medium.) These results were not transformed into media plans for their clients because it was known that the impact of television and print advertising was much greater than that of radio. Hence, they then added constraints to the model as to the amount of money that could be allocated to radio and were then able to obtain useful results.

Recommendations for further research into modeling psychological operations are comparatively obvious. A means needs to be developed for classifying transmitted propaganda,

as to exposure and impact, as a function of media vehicle, length of transmission, content and type of audience. Procedures might also be developed for determining the effect of cumulative exposure and of establishing the point of diminishing (or even negative) returns for a particular propaganda theme. Ultimately, a method might be developed that would consider the entire spectrum of psychological operations. A major advertising agency has done work in considering overall advertising strategy and is presently using a model called DEMON (Decision Mapping Via Optimum Go-No Networks), which is a dynamic, adaptive model that uses extensions of chance programming to select optimal decision procedures.²⁹

It is hoped that the discussion, observations, and modeling techniques contained in this thesis will benefit future psychological operations. Although the problem of quantifying and dealing with the many variables inherent to psychological operations has by no means been completely solved, it is felt that a step has been taken in this direction.

13. ABSTRACT This thesis demonstrates the formulation and use of a "goal programming" model in optimizing the allocation of media for psychological operations. The parallels between advertising and psychological operations are outlined; particularly, those in connection with defining a product, specifying a target audience and measuring success. Attributes and limitations of the various forms of mass media are discussed. The problem is developed as one of minimizing the variance between a set of goals stated with respect to specified target audiences for varying time frames subject to budget and resource limitations. The goals considered are related to the total number of times that members of a target audience are subjected to propaganda, the percent subjected and frequency of subjection. Ultimately, a numerical example is presented to demonstrate the potential use of the model.

MEMORANDUM FOR UNDER SECRETARY OF DEFENSE (ACQUISITION,
TECHNOLOGY AND LOGISTICS)

SUBJECT: Final Report of the Defense Science Board Task Force on The Creation and Dissemination of Information in Support of Psychological Operations (PSYOP) in Time of Military Conflict

I am forwarding the final report of the Defense Science Board Task Force on The Creation and Dissemination of Information in Support of Psychological Operations (PSYOP) in Time of Military Conflict.

The Terms of Reference directed the Task Force to:

- assess the capability of the United States Armed Forces to develop programming and to broadcast factual information to a large segment of the general public;
- assess the potential of various airborne and land-based mechanisms to deliver such information; and
- assess other issues in the creation and dissemination of all forms of information in times of conflict, including satellite broadcasts and the use of emerging mobile communication technologies.

Of particular concern is the lack of an integrated PSYOP capability with the Strategic International Public Information (IPI) initiative. While a national capability is not the province of DoD, DoD certainly possesses capabilities and experience which would enhance the development of the IPI initiative. The Task Force also found that content creation and dissemination lagged commercial capabilities. Incorporating commercial capabilities should significantly enhance DoD PSYOP capabilities. Finally, although PSYOP has demonstrated its usefulness over time, the incorporation of PSYOP during time of conflict is sporadic and steps need to be taken to strengthen its position within the JTF/CINC organizational structure.

The report offers several recommendations addressing these problems with a major thrust being the incorporation of commercial capability into the creation and dissemination of PSYOP products.

I endorse all of the Task Force's recommendations and propose you review the Task Force Chairman's letter and report.

DEFENSE SCIENCE BOARD

MEMORANDUM FOR CHAIRMAN DEFENSE SCIENCE BOARD

SUBJECT: Final Report of the Defense Science Board Task Force on The Creation and Dissemination of Information in Support of Psychological Operations (PSYOP) in Time of Military Conflict

Attached is the report of the Defense Science Board Task Force on The Creation and Dissemination of Information in Support of Psychological Operations (PSYOP) in Time of Military Conflict.

The Terms of Reference charged the Task Force with reviewing PSYOP activities within the Department of Defense (DoD). The purpose of the review was to:

- assess the capability of the United States Armed Forces to develop programming and to broadcast factual information to a large segment of the general public;
- assess the potential of various airborne and land-based mechanisms to deliver such information; and
- assess other issues in the creation and dissemination of all forms of information in times of conflict, including satellite broadcasts and the use of emerging mobile communication technologies.

The Task Force was originally created because of concern over the limitations exhibited in recent military operations in the Balkans, where the *Commando Solo* (EC-130E) aircraft were unable to disseminate TV and radio broadcasts. The Task Force chose to broaden its charter and address issues associated with PSYOP as part of an overall Information Operations (IO) campaign during peace, crisis, and armed hostilities. It also evaluated organizational issues associated with PSYOP forces within DoD and addressed issues associated with the PSYOP community's relationship to the Intelligence Community. Of particular interest is the on-going worldwide explosion of information creation and dissemination technologies and capabilities. The Task Force spent considerable effort addressing modern trends in information dissemination and media content creation. With those trends as a backdrop, the Task Force then assessed the viability of the current *Commando Solo* fleet and a variety of options currently being studied by DoD.

The Task Force found that Military PSYOP offer a unique and powerful asset in military operations, both in peacetime and in war. However, outdated equipment and organizational issues often hamper the creation of PSYOP products that meet mission needs. Given the broad array of complex missions conducted by U.S. military forces, understanding the culture and preparation of the "soft" battlespace is imperative to the conduct of successful operations. A robust and flexible PSYOP capability can be an invaluable tool in these efforts.

With these issues in mind, the report offers several recommendations. The Task Force believes that a major effort is required to integrate DoD PSYOP with International Public Information initiatives to build brand identity and delivery mechanisms required to ensure the message is heard during time of conflict. Efforts at the strategic, operational, and tactical level require expert content and market analysis which is widely available in the commercial marketplace. Additionally, DoD needs to acquire the technical capability to understand emerging media dissemination techniques and technologies in order to implement emerging techniques when warranted. More robust connections with the Intelligence Community, specifically the Defense Intelligence Agency are required to enhance PSYOP products for specific countries and regions. Rank structure should be reviewed to ensure the PSYOP commander receives adequate access to the Joint Task Force Commander/CINC which will help enable PSYOP integration with the overall operational plan. Finally, the Task Force recommends against crossdecking the existing Special Mission Equipment used on the *Commando Solo* aircraft from the current EC-130E to the EC-130J. Instead, we should begin the design and development of small and easily reconfigurable information dissemination packages that would be compatible with multiple platforms.

The Task Force would like to express its appreciation for the cooperation, advice, and help provided by the government advisors, support staff, and the many presenters.

A handwritten signature in black ink, appearing to read "Vince Vitto". The signature is fluid and cursive, with a large initial "V" and a stylized "Vitto".

Mr. Vincent Vitto
Task Force Chairman

Executive Summary

The Defense Science Board (DSB) Task Force on the Creation and Dissemination of All Forms of Information in Support of Psychological Operations (PSYOP) in Time of Military Conflict was charged with reviewing PSYOP activities within the Department of Defense (DoD). The purpose of the review was to:

- assess the capability of the United States Armed Forces to develop programming and to broadcast factual information to a large segment of the general public;
- assess the potential of various airborne and land-based mechanisms to deliver such information; and
- assess other issues in the creation and dissemination of all forms of information in times of conflict, including satellite broadcasts and the use of emerging mobile communication technologies.

Military PSYOP offers a potentially unique and powerful asset in military operations, both in peacetime and in war. However, the creation of PSYOP products that meet mission needs is often hampered by outdated equipment and organizational issues. Given the broad array of complex missions conducted by U.S. military forces, understanding the culture and preparation of the “soft” battlespace is imperative to the conduct of successful operations. A robust and flexible PSYOP capability can be an invaluable tool in these efforts.

The Task Force’s Terms of Reference (TOR) asked that the study examine the issue of creating and disseminating information in times of military conflict. (The full TOR is shown in Appendix A, while the Task Force membership and the individuals, both inside and outside DoD, who met with members of the Task Force are presented in Appendix B and Appendix C, respectively.) The Task Force and its TOR were motivated by Congressional language in Public Law 106-65, Section 1061 of the National Defense Authorization Act for Fiscal Year 2000, shown in Appendix D, which requested that the Secretary of Defense establish a Task Force to examine (1) the use of radio and television broadcasting as a propaganda instrument in times of military conflict and (2) the adequacy of the capabilities of the U.S. Armed Forces to make such uses of radio and television during conflicts such as the one in the Federal Republic of Yugoslavia in the Spring of 1999.

After initial discussions and briefings, the Task Force broadened the focus of the study to cover the nature of PSYOP as a whole, including organizational issues, PSYOP as part of an overall Information Operations (IO) campaign, and the increase in media opportunities. From the outset, the Task Force concluded that the dissemination of information via television (TV) and radio must be viewed as part of a comprehensive PSYOP campaign covering strategic, operational, and tactical military operations. This report begins with a vision of future PSYOP capabilities as part of an integrated overall information campaign and an overview of how PSYOP activities are conducted today.

Chapter 2 then presents a discussion of the organizational issues and challenges that current PSYOP forces face. Chapter 3 discusses the characterization of target audiences and the need to create an effective and believable brand identity for disseminating the message. Chapter 4 discusses future media production and dissemination trends and how they will likely affect the dissemination of PSYOP products worldwide. Chapter 5 examines the use the *Commando Solo* aircraft to disseminate information via TV and radio broadcasts. Finally, chapter 6 summarizes the Task Force's recommendations.

The Task Force focused on current and future technologies for the dissemination of PSYOP products, organizational issues, and mission needs and requirements. However, the use of PSYOP in military operations must be viewed as an integral part of the operation, and not as an afterthought. For PSYOP to be most effective, efforts must be made to include PSYOP as part of an integrated information operation over *all* phases of conflict, from peacetime to hostilities.

Recommendations

This DSB Task Force was originally created because of concern over the limitations exhibited in recent military operations in the Balkans, where the *Commando Solo* (EC-130E) aircraft were unable to disseminate TV and radio broadcasts. The Task Force chose to broaden its charter and address issues associated with PSYOP as part of an overall Information Operations (IO) campaign during peace, crisis, and armed hostilities. It also evaluated organizational issues associated with PSYOP forces within DoD and addressed issues associated with the PSYOP community's relationship to the Intelligence Community. Of particular interest is the on-going worldwide explosion of information creation and dissemination technologies and capabilities. The Task Force spent considerable effort addressing modern trends in information dissemination and media content creation. With those trends as a backdrop, the Task Force then assessed the viability of the current *Commando Solo* fleet and a variety of options currently being studied by DoD. The following recommendations were derived from all of these considerations.

If PSYOP is to be a useful tool in the future, it must be a nimble asset capable of delivering the right information quickly, and in a manner that is a technologically as sophisticated as any possible competitor within the region. In the future, the value of PSYOP will clearly be seen as best utilized before and after the conflict. PSYOP used before will help shape the military context in a favorable fashion for the U.S. forces. In the best case scenario, PSYOP actions will be coupled with other flexible deterrent options and actually prevent conflict. PSYOP after a conflict will shape the way U.S. military actions are perceived by people in the region and help to achieve the end state desired by the Theater CINC and the National Command Authorities. In the future, bombs and missiles will still determine who militarily wins or loses a conflict at tactical level. PSYOP, though, will help determine how long a conflict lasts and the impact of a military struggle on long term U.S. strategic interests.

Recommendation 1

The Task Force recommends that DoD create a PSYOP policy/planning staff, under the coordination authority of the Assistant Secretary of Defense for Special Operations and Low-Intensity Conflict (OASD(SO/LIC)). This staff should ensure the integration of operational and tactical level PSYOP with strategic International Public Information (IPI) initiatives and provide planning support for strategic PSYOP activities, as described in Presidential Decision Directive (PDD) 68.

Recommendation 2

The Task Force recommends that rank structure and career paths within PSYOP forces should be reassessed and more specifically:

- *the senior PSYOP Advisor to the geographical CINCs should be an O-6 or equivalent civilian and should be assigned to the CINC Special Staff, and*
- *the Commander of the Joint PSYOP Task Force supporting the Joint Task Force Commander in theater (typically a three-star flag officer) should also be an O-6.*

Recommendation 3

The Task Force recommends that the Office of OASD(SO/LIC) and U.S. Special Operations Command (USSOCOM) strive to improve overall product quality through increased reliance on commercial providers for high-quality products. Furthermore, the Task Force recommends that the PSYOP force be adequately resourced and trained to engage a stable of commercial media content providers who can deliver these quality products. The Task Force estimates this investment to be approximately \$10 million per year.

Recommendation 4

The Task Force recommends that the Defense Intelligence Agency be tasked by the Assistant Secretary of Defense for Command, Control, Communications, and Intelligence (ASD C3I) to establish a psychological warfare intelligence element. ASD C3I should be charged to either (a) provide resources to the PSYOP community to implement a robust organic program of open source acquisition, or (b) task the Intelligence Community to fulfill the need for on-the-shelf, worldwide basic information, including the media and cultural background information necessary to adequately inform PSYOP products in a given country. The Task Force believes that this can be accomplished without incurring an additional budgetary burden.

Recommendation 5

The Task Force recommends that ASD C3I make National Foreign Intel Program/Joint Military Intel Program (NFIP/JMIP) funds available to USSOCOM for the express purpose of acquiring available data sets, particularly for countries outside North America and Europe. The Task Force also recommends that USSOCOM work with the Foreign Military Studies Office (FMSO) to ensure the integration of these data sets with the World Basic Information Library (WBIL) and their community-wide accessibility. Moreover, the Intelligence Community should be further tasked through ASD C3I to

develop methods and sources to obtain media use demographic information where it is not now available but where the U.S. might plausibly have future national security interests in which PSYOP might be employed. The Task Force estimates this investment to be approximately \$5 million per year.

Recommendation 6

The Task Force recommends that the Office of the Secretary of Defense (OSD) work with the Department of State to fund, position, exercise, and maintain suitable distribution channels and brand identities, insofar as these can be reasonably anticipated for future PSYOP requirements. Policies with respect to the use of new and emerging transnational media need to be developed or refined. Liberal reliance on recognized professionals and the generous use of highly qualified commercial entities are highly recommended. Buying good content on which the messages will "ride" is a necessary and desirable expenditure. The Task Force estimates this investment to be approximately \$10 million per year.

Recommendation 7

The Task Force recommends that DoD acquire the technical capability to understand emerging media dissemination techniques and technologies. Furthermore, DoD should provide the resources to acquire (rent or purchase) emerging media content and dissemination channels from commercial organizations. Here, DoD may be able to acquire good channels very cheaply by means of being an "anchor tenant." The Task Force estimates this investment to be approximately \$10 million per year.

Recommendation 8

The Task Force recommends that DoD maintain the current EC-130E Commando Solo fleet with existing Special Mission Equipment (SME). The estimated cost of \$250 million to cross-deck the SME to a EC-130J platform is not justified by the marginal increase in performance offered by this option. In addition, future worldwide media dissemination trends will limit the effectiveness of radio and TV broadcasts. The Task Force recommends that USSOCOM investigate the creation of small and easily reconfigurable information-dissemination packages that would be compatible with multiple platforms, including UAVs and leased aircraft, for a variety of missions. The Task Force estimates the initial investment for design and development of these packages to be \$10 to \$20 million per year.

Recommendation 9

The Task Force has recommended annual funding increases (in recommendations 1 through 8) of approximately \$50 million per year. The Task Force believes that this increase would be readily supported by reprogramming the \$250 million that would be required to fund cross-decking the existing Commando Solo SME to the EC-130J platforms.

The prompt and effective use of PSYOP in military operations can avert crises, end wars, and save lives. DoD should prioritize Psychological Operations appropriately, because the misuse of PSYOP can cause untold damage to military operations. A relatively small

investment over time can reap huge rewards for the United States and its allies, both diplomatically and militarily.

CHAPTER 1

Introduction

1.1 Purpose of the Study

The Defense Science Board (DSB) Task Force on the Creation and Dissemination of All Forms of Information in Support of Psychological Operations (PSYOP) in Time of Military Conflict was charged with reviewing PSYOP underway in the Department of Defense (DoD). The purpose of the study was to:

- assess the capability of the United States Armed Forces to develop programming and broadcast factual information that can reach a large segment of the general public;
- assess the potential of various airborne and land-based mechanisms to distribute such information; and
- assess other issues in the creation and dissemination of all forms of information in time of conflict, including satellite broadcasts and the use of emerging mobile communication technologies.

Military PSYOP offers a potentially unique and powerful asset in military operations, in both peacetime and in war. However, the creation of PSYOP products that meet mission needs is often hampered by outdated equipment and organizational issues. Given the broad array of complex military operations conducted since the end of the Cold War, and assuming these operations will continue in the future, it is imperative to understand the culture and preparation of the “soft” battlespace in order to conduct successful operations. A robust and flexible PSYOP capability can be an invaluable tool in these efforts.

The Task Force’s Terms of Reference (TOR) asked that the study examine the creation and dissemination of information in times of military conflict. (The full TOR is shown in Appendix A, while the Task Force membership and a list of experts, both inside and outside DoD, who met with members of the Task Force are presented in Appendix B and Appendix C, respectively.) The Task Force and its TOR were motivated by Congressional language in Public Law 106-65, Section 1061 of the National Defense Authorization Act for Fiscal Year 2000, shown in Appendix D, which requested that the Secretary of Defense establish a Task Force to examine (1) the use of radio and television broadcasting as a propaganda instrument in times of military conflict and (2) the adequacy of the capabilities of the U.S. Armed Forces to make use of radio and television during conflicts such as the one in the Federal Republic of Yugoslavia in the Spring of 1999.

From the outset, the Task Force concluded that dissemination of PSYOP information via TV and radio must be addressed in the context of an overall information operations campaign, in peacetime and during hostilities. It therefore broadened its focus to include information on the nature of PSYOP as a whole, including organizational issues, PSYOP

as part of an overall Information Operations (IO) campaign, the characterization of target audiences, and the increase in media opportunities. Instead of focusing merely on the dissemination of information, the Task Force began the study with an overview of how PSYOP is conducted today and then turned to a discussion of the organizational issues and challenges the current PSYOP forces face. It was agreed that the effective characterization of target audiences and the creation of an effective and believable brand identity for disseminating a credible message and product is critical to successful PSYOP. Also critical is a clearer understanding and better modeling of future media trends and how they could affect the dissemination and nature of PSYOP. Finally, the Task Force examined the issue of information dissemination and in particular the utilization, capabilities, and future applicability of the *Commando Solo* aircraft.

1.2 The Increased Relevance of PSYOP

Military Psychological Operations (PSYOP) are programs of products and/or actions that induce or reinforce the attitudes, opinions, and emotions of selected foreign target governments, organizations, groups, and individuals to create a behavior that supports U.S. national policy objectives and the theater combatant commander's intentions at the strategic, operational, and tactical levels. PSYOP events are planned, coordinated, and executed before, during, and after conflicts. PSYOP actions are a subset of Information Operations (IO) and International Public Information (IPI) as described by Presidential Decision Directive (PDD) 68.

Psychological Operations (PSYOP) have been a part of military strategy throughout history. In the recent past, PSYOP campaigns were utilized by both sides in World War II, the Cold War, Vietnam, and the Gulf War. During these large scale conflicts, the PSYOP campaigns were predominantly effective from a United States and coalition partner perspective, except in Vietnam, where PSYOP was more effectively used by the adversary. In more recent conflicts PSYOP played a major role in the US successes in Grenada and Haiti, but has been viewed as particularly successful in the recent Balkan conflicts (Bosnia and Kosovo).

While neither the definition nor the purpose of PSYOP has significantly changed since the end of the Cold War, the nature of conflict, the available technologies, the socio-political environment, and the character of operations involving military forces have all changed dramatically.

Individuals from various backgrounds and perspectives briefed the Task Force and spoke of the growing importance of PSYOP to the success of any action the U.S. Government undertakes overseas, whether diplomatic or military. While the United States is years ahead of its competitors in terms of military technology, in terms of PSYOP there are already competitors on par with or even arguably more sophisticated than the U.S. The weakness of U.S. military PSYOP is ironic because the United States leads the world in commercial media technology and development. However, foreign rivals are often more flexible, less restricted by outdated equipment and policy, and better able to take advantage of changes in the manner in which people communicate.

Figure 1.1 Serbian use of propaganda during the Kosovo Crisis

The dense nature of the global information environment, coupled with the importance of the "media message," was demonstrated in past military crises in populations and cultures as diverse as Iraq, Serbia, and Somalia. The trend to involve the U.S. military in peacekeeping operations, where the use of violence is carefully prescribed by restrictive rules of engagement, has furthered emphasized the need for effective information activities. In peacekeeping operations, military PSYOP forces can expect to operate for an extended period of time in an area where sophisticated, robust, indigenous media competes with the U.S. military PSYOP message. In this environment, military PSYOP will not have the ability to monopolize an area's information outlets through destruction or jamming. In fact, PSYOP forces today must often compete with numerous international neutral entities to gain the attention of an intended foreign target audience.

In the Information Age, there is an increasing reliance on sophisticated, near-real time media dissemination. Information, and its denial, is power. The state or entity most able to effectively control or manage information, especially managing the perceptions of particular target audiences, will be the most influential. Future adversaries will be more likely to attempt to rely upon their ability to subvert U.S. foreign policy goals through the use of sophisticated propaganda -- on both its own populace and on international audiences -- than to confront the United States and its coalition partners through traditional military means. They will try to manipulate U.S. policy through selected, discriminate propaganda via both legitimate news media and non-traditional means. For military PSYOP to be effective, they must be continuous and integrated with the other elements of IO.

1.3 A PSYOP Future Vision

If PSYOP is to be a useful tool in the future, it must be a nimble asset capable of delivering the right information quickly, and in a manner that is as technologically sophisticated as any possible competitor within the region. In the future, the value of PSYOP will clearly be seen as best utilized before *and* after the conflict. PSYOP used before will help shape the military context in a favorable fashion for the U.S. forces. In the best case scenario, PSYOP actions will be coupled with other flexible deterrent options and actually prevent conflict. PSYOP after a conflict will shape the way U.S. military actions are perceived by people in the region and help to achieve the end state desired by the Theater CINC and the National Command Authorities. In the future, bombs and missiles will still determine who militarily wins or loses a conflict at tactical level. PSYOP, though, will help determine how long a conflict lasts and the impact of a military struggle on long term U.S. strategic interests.

If the recommendations for military PSYOP contained in this study are enacted, the future military PSYOP capability may well resemble the following description which is also captured in Figure 1.2.

Figure 1.2 PSYOP integrated over all phases of conflict

- **Strategic PSYOP:** A permanent PSYOP staff organization under the direction of ASD SO/LIC, will work closely with U.S. Department of State Public Diplomacy staff members. Their primary purpose, in accordance with Presidential Decision Directive 68, will be to assist the Department of State in developing strategic International Public information plans and programs. Additionally, this strategic PSYOP policy and planning staff will also be able to de-conflict and synchronize the Theater CINC's PSYOP scheme with the

strategic International Public Information plan. The link between the strategic PSYOP policy/planning staff and the theaters will occur through the Joint PSYOP Headquarters. For the first time, this headquarters will bring all the military PSYOP assets under one organization. Commanded by a flag officer, the Joint PSYOP Headquarters will maintain open contracts with civilian advertising and marketing firms for assistance in PSYOP product development and links with members of academia studying the potential impact of information on the attitudes and behaviors of foreign target audiences.

- **Operational PSYOP:** In this future PSYOP structure, wartime operational PSYOP will diminish in significance. Much of what is termed today as "operational PSYOP" will occur during future conflict at the strategic or tactical level. However, in the future, operational PSYOP will still be an important contributor during peacetime. In the future, the PSYOP perspective will always reach the Theater CINC because of the existence of a senior PSYOP Advisor (PSYAD). The PSYAD position, a member of the CINC's Special Staff, in close consultation with the Political Advisor, will provide the CINC with a unique viewpoint on the motivations of the people within a specific area of operation. The PSYAD also will advise the CINC on how best to deploy the PSYOP forces organic to his theater. This will be organic PSYOP because PSYOP forces will no longer be exclusively located in CONUS but permanently assigned to their particular theater of operations. This forward deployment will eliminate the long delay caused today by the current requirement for the CINC's staff to request any and all PSYOP forces and for the Joint Staff to issue deployment orders. By having permanent in-theater PSYOP forces, CINC's, in coordination with the various U.S. Embassy Country Teams, will be able to execute a more robust peacetime PSYOP program and have far more confidence and control of their PSYOP assets. Through coordination by way of the Joint PSYOP Headquarters, the Theater CINC's PSYOP staff will provide input into strategic PSYOP plans and programs and insure their efforts are synchronized fully with the International Public Information efforts. During periods of crisis and war, the Theater PSYOP forces will use a variety of platforms, both manned and unmanned to disseminate information. Some of these assets will be based in space and owned by commercial interests, and some others will be owned by other-than-DOD agencies within the U.S. government.
- **Tactical PSYOP:** Future tactical PSYOP teams will more resemble electronic news gatherers as opposed to loudspeaker teams. PSYOP soldiers will no longer carry loudspeakers in high threat environments. Instead, PSYOP messages will be routed through a wireless network to unmanned speakers. Loudspeakers will be mounted on the outside of more survivable armored vehicles like tanks and will be dropped in the enemy's rear areas. The primary purpose of tactical PSYOP teams will be to gather video footage and send it for further editing to various PSYOP production centers.

Communications links will be robust and real time. Footage gathered by these soldiers will be sent directly back to the Joint PSYOP Headquarters and incorporated into the Department of State's Worldnet Television transmissions. In peacetime, local media contracts will be typically consummated in order to disseminate PSYOP materials.

1.4 PSYOP Today

Used properly, PSYOP can help, in the words of the Chinese philosopher Sun Tzu, "subdue the enemy's army without battle." Especially in an era when any loss of life is politically sensitive, the ability of PSYOP to be a 'combat reducer' and save the lives of U.S. troops and citizens, as well as opposing force personnel, is exceedingly important. PSYOP forces offer U.S. policymakers and warfighters a more discreet and often more politically palatable tool than conventional military activities, which are primarily designed to bring the adversary to heel through death and destruction.

However, to be a "combat reducer," PSYOP must be robust and integrated into each element of power. Unfortunately, the current PSYOP structure reflects an outdated Cold War policy, with U.S. PSYOP forces primarily oriented toward supporting tactical forces on the ground, using loudspeaker operations and face-to-face communications. Nevertheless, given the increased velocity of information at every level, and the need to react more quickly to local situations, U.S. military commanders have increasingly relied upon PSYOP forces at all levels as their conduit for information to foreign populations. These commanders depend upon their PSYOP officers and non-commissioned officers to communicate information and expectations, irrespective of local or international competition, in a manner that challenges the PSYOP organizational structure.

1.4.1 Strategic PSYOP

In the past, there were clear distinctions between the three levels of PSYOP: strategic, operational, and tactical. In the post-Cold War world, however, these distinctions have blurred to the extent that they may no longer exist. The world's almost instantaneous access to news and information makes it nearly impossible to localize any information campaign. A leaflet handed out in Bosnia is just as likely to be shown by a reporter on the nightly news in the United States or Europe as it is to be read in Sarajevo.

Figure 1.3 PSYOP Tools Today

Strategic PSYOP, in accordance with PDD 68, is defined as having global implications and is planned, initiated, and executed at the national level. Military PSYOP support strategic PSYOP through planning, and if tasked, through the dissemination of assets. Military PSYOP should also ensure that the geographic CINC's peacetime engagement activities are harmonized with the national strategic PSYOP plan. Despite recent attempts to ensure better coordination, PSYOP plans at the strategic level suffer from a lack of synchronization. Currently, there is not a systemic manner in which military PSYOP organizations gain insight into the strategic perception-management effort – nor is there a practiced method to de-conflict a supported CINC's theater information activities with the national information effort. While strategic PSYOP actions are most effective during peacetime, military PSYOP doctrine and organizational structure are principally configured to respond during a conflict. This over-emphasis on wartime operations is viewed by the Task Force as a deficiency of today's PSYOP force.

1.4.2 Operational PSYOP

During periods of conflict, military PSYOP capabilities and doctrine are more developed and effective. During warfighting, PSYOP elements are flexible and can provide support with a small team or with a robust Joint PSYOP Task Force (JPOTF), potentially consisting of thousands of individuals. Given enough time during a crisis, PSYOP forces can provide a surge capability from bases in the United States to the theater CINC headquarters, supplementing existing PSYOP planning capabilities and/or establishing PSYOP headquarters for multiple Joint Task Forces. Operational PSYOP actions impact throughout the entire military theater of operations and typically consist of widespread

television and radio broadcasts, and newspaper, magazine, and leaflet dissemination. To be effective, PSYOP planners on the supported CINC's staff must oversee and coordinate PSYOP prior to the deployment of large forces from the United States. PSYOP planning staff billets forward in the theaters are however typically thinly and inconsistently manned.

Operational-level military PSYOP forces today are asked to compete against sophisticated local and international media organizations, which are often better funded and more technically sophisticated. Unlike their rivals, U.S. PSYOP forces today cannot readily disseminate materials over the Internet or via commercial broadcast satellites. In addition, the PSYOP force is largely composed of a rather small pool of U.S. Army personnel, who are at best media amateurs. These forces must attempt to compete against often better trained foreigners, who are less encumbered by policies and organizational structures. Ideally, PSYOP research regarding foreign audiences should be modern and sophisticated, and should utilize a wide range of national intelligence capabilities and leverage the latest in commercial marketing and polling techniques. In reality, however, U.S. PSYOP forces have difficulty making intelligence collection requirements known and accessing intelligence. In addition, PSYOP personnel are often untrained in civilian marketing, polling, and media production skills.

Moreover, the PSYOP capability to disseminate via television and radio broadcasts in denied areas is extremely deficient. The current capability for radio and television dissemination is limited to the use of *Commando Solo* aircraft, which have the capability to broadcast AM and FM radio and VHF and UHF TV signals from an altitude of 18,000 feet. The Special Mission Equipment (SME) carried on the EC-130E aircraft features technology that is decades old and vulnerable to an adversary's countermeasures. The current PSYOP operational concept features the deployment of a small element of PSYOP forces forward in the supported CINC's theater of operations. These deployed forces would be primarily supported by PSYOP plans, programs, and products developed at the PSYOP headquarters in Fort Bragg, North Carolina. This so-called "Reachback" concept is dependent upon an enormous amount of bandwidth through secure communications links. In practice, "Reachback" has often been very difficult to institute and support.

1.4.3 Tactical PSYOP

Military tactical PSYOP are actions taken in a local area with focused impact. Loudspeaker operations, handbills, local radio broadcasts, and television programming are typical tactical PSYOP actions. Today's PSYOP capability at the tactical level is quite well developed. Recently, PSYOP forces supporting local military commanders were augmented with a capability to produce a limited range of PSYOP products.

In fact, one could make the argument that the current PSYOP structure is too heavily focused toward tactical PSYOP. This structure makes it difficult to support the theater CINCs, especially in an age when the power of electronic media has, in many areas of the

world, overwhelmed the print alternative. Within the current PSYOP organizational structure, the PSYOP regional battalions, primarily responsible for operational-level PSYOP, are the most heavily deployed PSYOP forces and struggle to meet the manpower requirements for the numerous contingency missions. With enough PSYOP tactical forces to support seven Army corps equivalents (one PSYOP tactical battalion is allocated to a corps equivalent), the imbalance between regional and tactical PSYOP forces in the current force structure is obvious.

A major concern regarding tactical PSYOP forces is the survivability of these units during mid- and high-intensity conflicts. With the lethality of the weaponry on the modern battlefield, the lifespan of the three-person PSYOP tactical team in a lightly armed HMMWV, equipped with a loudspeaker with a range of a mere thousand meters, would probably be measured in terms of hours, if not minutes. Should PSYOP loudspeaker operations be needed at the front lines in such difficult threat environments, they will need to be accomplished remotely via a more heavily armored manned vehicle or an unmanned vehicle (either aerial or ground). The capability to conduct remote loudspeaker operations is currently not present in the PSYOP force.

CHAPTER 2

Organizational Issues

The expectation that the air campaign [against Serbian forces] would last only a short time also was a detriment to the NATO psychological operations effort [in the 1999 Kosovo campaign], since those assets were not included in the initial plans. It took two weeks to start delivering products and some 30 days to develop a campaign plan. Serbia started its psychological operations campaign days earlier and won the early initiative.

Timothy L. Thomas, "Kosovo and the Current Myth of Information Superiority," Parameters, Spring 2000, pp. 13-29.

Although USCINCENT's approval for the theater PSYOP plan was received in late September, execution authority was not granted until December. The interagency approval process, mandated by DoD Directive 3321.1 [Overt Psychological Operations Conducted by the Military Services in Peacetime and Contingencies Short of Declared War], was glacial. Had the Saudis not requested U.S. support to encourage Iraqi desertion and defection, culminating in the formation of a combined U.S., Saudi, Egyptian, Kuwaiti and British PSYOP effort and the King's approval to execute, it is doubtful that PSYOP would have been allowed to play an active role in the [Gulf] war at all.

Jeffrey B. Jones and Jack N. Summe, "Psychological Operations in Desert Shield, Desert Storm and Urban Freedom," AUSA Landpower Essay Series, No. 97-2, August 1997.

The above quotes suggest that, in a crisis, DoD cannot conduct psychological operations any faster than the U.S. Government can produce its International Public Information (IPI), Public Diplomacy (PD), and coordinated PSYOP campaign plans.

2.1 Strategic Relationships of Military PSYOP With Non-DoD Agencies

Organizational debates are hardly new to U.S. PSYOP. Indeed, differences over the institutionalization and organization of propaganda in U.S. national security have been a central theme in the evolution of PSYOP throughout the 20th century. Since World War I, the organization of PSYOP has been hotly debated and U.S. military PSYOP capabilities have waxed during wartime and waned during peace.

Since the early 1980s, military PSYOP have become well institutionalized within DoD. The 1983 National Security Decision Directive (NSDD) 77 ("Management of Public Diplomacy Relative to National Security"); the 1984 National Security Decision 130 ("U.S. International Information Policy"), which instructed DoD to rebuild military PSYOP capabilities; and the 1985 DoD PSYOP Master Plan reversed the post-Vietnam atrophy of military PSYOP capabilities.

This institutionalization of military PSYOP forces, however, did little to eliminate the differing opinions over the organization of PSYOP, particularly regarding national-level interagency coordination of PSYOP campaigns. Since the early 1980s, every NSDD and Presidential Decision Directive (PDD) dealing with IPI, PD, or PSYOP (for example, NSDDs 45, 77, and 130 and PDDs 56 and 68) has required broad interagency coordination of PSYOP between DoD and other national security departments and agencies, under the purview of special ad hoc groups. Nonetheless, DoD PSYOP Master Plans (1985, 1990), and critical assessments during the same period, called repeatedly for improved and streamlined interagency coordination of PSYOP plans and products.

Under PDD 68, the International Public Information Core Group (ICG), chaired by the Under Secretary of State for Public Diplomacy and Public Affairs, coordinates all agencies' IPI activities. If PSYOP campaign plans are not already prepared, the coordination required throughout the U.S. national security community will take time. As a result, the influence of PSYOP on a crisis will not be timely.

During crises PSYOP campaign plans wait upon a complex process of interagency review, coordination, and approval. The most insightful and creative processes for developing PSYOP products, and the most modern media and technologies for delivering PSYOP messages, avail nothing if organizational structures are too complex, inexperienced, or inefficient to coordinate and approve campaign plans in time to influence developing or ongoing crises. As PSYOP adapt to support "Internet War" and as future information operations occur in "Internet time," these issues become even more difficult.

The U.S. PSYOP organizational challenges offer adversaries a clear asymmetric opportunity during crises: they can beat the United States and its allies in getting out the first PSYOP messages. Moreover, if the opponent plans the actions that trigger the crisis, the opponent has that much more lead time to ready its PSYOP campaign.

This DSB Task Force believes that a permanent, properly constituted interagency body should be established within the National Security Council charged with all U.S. Government IPI, PD, PSYOP and other peacetime management policies and operations. An authoritative standing body would ensure on-going, front-end, continuous interagency dialogue, coordination, and integration.

PSYOP actions cue a very flexible component of an overall IO plan. During times of peace or crisis, PSYOP can support strategic international information operations through planning and, if tasked, through the dissemination of assets. *This Task Force found military PSYOP capabilities during periods of peace and crisis to be especially wanting. Traditionally focused on tactical military support, PSYOP forces are particularly challenged to provide support at the strategic level. To retain relevancy and raise effectiveness, military PSYOP forces must augment their current strategic capabilities.*

Strategic international information operations have global policy implications and, in accordance with PDD 68, are planned at the national level. Nevertheless, military

PSYOP planners can serve as a link to inform and synchronize the actions of the geographic CINC in whose theater the strategic perception-management action may be targeted. Additionally, geographic CINCs are now engaged in vigorous theater peacetime engagement activities, where PSYOP forces often play a robust and sometimes key role. As part of these engagement activities, PSYOP forces often develop an Overt Peacetime PSYOP Program (OP3) tailored for the supported geographic CINC.

This Task Force believes that strategic-level PSYOP suffer from a lack of coordination with other U.S. Government organizations that disseminate information to foreign audiences (such as, Radio Marti, Voice of America, Radio Free Europe, and Worldnet Television). This can lead to an uncoordinated effort in various regions around the world, where the U.S. Government's information dissemination power is not used to its fullest advantage. In addition, contradictory information themes could be broadcast simultaneously through the various venues. PDD 68 is designed to help make this coordination occur more effectively. Still, military PSYOP often conduct their information activities oblivious to the higher level perception-management efforts emanating from the Department of State and National Security Council. In addition, U.S. Government agencies outside DoD often do not fully exploit the expertise resident in military PSYOP with respect to knowledge of foreign audiences and information planning capabilities. *Therefore, DoD should create a small military PSYOP planning staff, under the coordination authority of the Office of the Assistant Secretary of Defense for Special Operations and Low-Intensity Conflict (OASD(SO/LIC)) to ensure that operational- and tactical-level PSYOP are integrated with strategic perception-management initiatives and that planning support is provided for strategic PSYOP activities.*

2.1.1 The Requirement for a PSYOP Vision and Operational Concept

The 1985 and 1990 PSYOP Master Plans called for a Joint PSYOP vision and operational concept. The publication of *Joint Vision 2010* and the corresponding service vision statements make these recommendations even more compelling. The call for a PSYOP vision and operational concept is repeated again in the 1999 *Joint Psychological Operations Enhancement Study* and endorsed by USSOCOM's review of that study. During the revival of U.S. PSYOP capabilities over the past 15 years, there has been much consensus on the need for a PSYOP vision and operational concept but the production of this document is long overdue.

Weaknesses exposed in U.S. military PSYOP response to recent events in both Bosnia and Kosovo have awakened many to the need to make significant changes. The vast majority of U.S. military PSYOP forces reside in the U.S. Army. This rather small group has a Cold War-oriented structure, often antiquated equipment, and limited financial support. Yet, it is inundated with requests for support from the geographic CINCs to get information to foreign target audiences -- audiences that are being served by an ever expanding array of information dissemination options. The good news is that within military PSYOP forces there is both a willingness to consider new ways to conduct their mission and movement in positive directions to effect change. Nevertheless, it is clear

that this movement is neither robust enough to quickly solve identified deficiencies, nor is it sufficiently supported outside the PSYOP community.

Until a 'road map' for the future of PSYOP is drafted and implemented, it is difficult to see how PSYOP can remain relevant and develop the capabilities to best serve the geographic CINCs. As the first step to remedy the deficiencies within military PSYOP, the Department of Defense must draft a military PSYOP Vision as well as an accompanying future PSYOP Operational Concept.

This action should be undertaken by OASD(SO/LIC), in conjunction with the Joint Staff J39, and USSOCOM. Furthermore, the Task Force believes that these actions should be completed within 12 months. These documents need to be multi-service and interagency in scope, and revolutionary in perspective. As a touchstone, the PSYOP Vision must be in accordance with the Chairman of Joint Chiefs of Staff's *Joint Vision 2010*. To avoid the problems experienced with the previous Master Plans, the document should be signed by the Secretary of Defense and have clear implementation schedules to ensure its adoption.

2.2 Should PSYOP Forces Be Exclusively Under USSOCOM?

Since the 1950s, the center of gravity of military PSYOP has been Fort Bragg, NC, and the Special Warfare Center. Indeed, the Special Warfare Center, established in 1956, evolved from the Psychological Warfare Center, established in 1952. Not surprisingly, as PSYOP capabilities were revived during the 1980s, they were aligned organizationally with special operations. Figure 2.1 shows the current organizational structure within USSOCOM where the bulk of PSYOP forces are concentrated in the 4th PSYOP Operations Group at Fort Bragg, North Carolina.

The authors of the 1985 PSYOP Master Plan, however, believed that the subordination of PSYOP to special operations "detracted from the recognition of the overall applicability of PSYOP in times of peace, crisis, and war..., contributed to the lack of understanding of PSYOP," and reduced the effectiveness of PSYOP planning at unified and specified commands. Despite guidance from the Secretary of Defense to separate PSYOP and special operations in implementing the 1985 Master Plan, after long review PSYOP were subordinated to USSOCOM in 1987.

Figure 2.1 Current SOCOM PSYOP Structure

The 1997 *Critical Assessment*, authored by the former commanders of the U.S. Army's 4th PSYOP Group, called for the creation of a Joint PSYOP Command under USSOCOM.¹ These former commanders saw future PSYOP enhancements as being dependent on:

- far more rank and representation for PSYOP at national levels and in the unified and specified commands and their components;
- far more independence of PSYOP from special operations in staffing, planning, and execution; and
- an all-but independent national-level Joint PSYOP Command, which would coordinate PSYOP support for transnational and national strategic-level, as well as theater-level, operational plans and operations.

The Task Force's investigations led to the conclusion that during periods of conflict, military PSYOP capabilities, particularly at the tactical level (Army Corps equivalent and below), are more developed and effective. Military PSYOP doctrine and organizational structure are primarily configured to respond during a conflict.

¹ *Psychological Operations into the 21st Century: A Critical Assessment*, 15 May 1997, U.S. Army John F. Kennedy Special Warfare Center and School.

During warfighting, PSYOP elements are flexible and can provide tactical-level support with a small team or operational-level support with a robust Joint PSYOP Task Force (JPOTF), potentially consisting of thousands of individuals. Given enough time during a crisis, PSYOP forces can provide surge capability from bases in the United States to the theater CINC headquarters, supplementing existing PSYOP planning capabilities and/or establishing PSYOP headquarters for multiple Joint Task Forces at the operational-strategic level of war.

Figure 2.2 PSYOP relevance

In addition to issues regarding PSYOP organization and USSOCOM, there are other organizational issues that merit further discussion.

Service PSYOP. Both the U.S. Air Force and the U.S. Navy are engaged at the service level, to a relatively limited extent, in PSYOP research, training, and doctrinal development, as well as in developing PSYOP organizations. Since joint military PSYOP is subordinated to USSOCOM, PSYOP doctrine, training, and organization should come under that command's purview.

PSYOP and Information Operations. While USSOCOM has responsibility for joint PSYOP, joint doctrine has established PSYOP as one of the "five pillars" of information IO, and DoD has assigned authority for some elements of IO to other commands (for example, USSPACECOM). The Task Force believes that the role of PSYOP in an overall IO strategy should be considered as part of the development of a PSYOP vision and operational concept.

Military PSYOP and Civilian Perception Management. There are repeated instances of military PSYOP absorbing and employing the talents and resources of civilian perception-management industries during conflict, and then dismissing them entirely from post-conflict PSYOP organization, planning, doctrine, and training. This issue is discussed in chapter 3.

2.3 Forward PSYOP Deployment To Support CINCs

The Task Force recognizes that the shortcomings of the recent NATO PSYOP campaign in Serbia and Kosovo will revive older questions regarding the effectiveness of PSYOP planning on the staffs of the warfighting CINCs. The shortcomings can be explained in part by the inadequacy of PSYOP planning support to the geographic CINCs, and in part by the lack of resources available for ongoing theater engagements of all types, including the CINCs' overt peacetime psychological operations programs.

The 1985 PSYOP Master Plan identified numerous shortcomings in PSYOP planning in the Unified and Specified (U&S) Commands. The 1985 Master Plan led to changes in Defense Planning Guidance, the Joint Operations Planning and Execution System, and the Joint Strategic Capabilities Plan. The 1990 PSYOP Master Plan pointed out that "the effect of the 1985 Plan was to initiate measurable improvements in each identified area, ameliorating many of the problems...." While the 1990 Master Plan included recommendations to further enhance PSYOP planning, none was directed at the U&S CINCs.

More recently, J39's *Joint PSYOP Enhancement Study*, and the former PSYOP Group commanders' *Critical Assessment* identified problems in PSYOP task organization to support warfighting CINCs. For example, the *Joint PSYOP Enhancement Study* found: "Each of the supported CINCs cited inadequate [PSYOP] force commitment to theater as a root cause of many deficiencies and problems during their evaluation of PSYOP support war scenarios" (p. 2-2-12). The *Critical Assessment* recommended that "PSYOP teams forward deploy to all theater SOC's (Special Operations Commands) to coordinate and participate in deliberate and crisis planning to ensure PSYOP participation on the front end and as the lead elements for the formation of Joint Psychological Operations Task Forces (JPOTFs) when called for by OPLANS" (p. 30). Some CINC staffs recommend a "standing JPOTF" comprised of CINC staff (implying great numbers of CINC PSYOP staff and planners) and personnel from the regional PSYOP support battalions.

The CINC staff participants in the *Joint PSYOP Enhancement Study* identified PSYOP organization for allied and coalition operations as a major shortcoming. The problems include a lack of a standing JPOTF organization, lack of SOPs, and inadequate training. Compounding these problems is the lack of PSYOP forces, SOPs, or doctrine among many allies and coalition partners.

This DSB Task Force agrees with the various recommendations offered by the Critical Assessment and by the Joint PSYOP Enhancement Study. To address the issue of PSYOP support to the CINCs, these recommendations depend on some combination of the following:

- *more PSYOP staff and planners on the CINC staff;*
- *enhanced capabilities to task and organize rapidly to support CINC planning and crisis action;*

- *establishment of a standing "nucleus" (possibly including CINC staff) around which a JPOTF or CPOTF would be established.*
 - *the Joint Staff (J39) and USSOCCOM should examine the adequacy of the existing PSYOP force structure (active and reserve) to fully support the doctrinal recommendation that the JTF be supported by a component-level JPOTF.*

2.4 Rank Structure of PSYOP Forces

There are several arguments favoring greater rank within PSYOP forces.

First, there are the high interest in and high expectations of PSYOP across the spectrum of peace, crisis, and war, coupled with demands for "wide-band" coordination up and down the chain of command. With such expectations must go commensurate responsibility and authority.

Second, the ongoing efforts to modernize and capitalize military PSYOP with advanced capabilities for production, dissemination, and delivery put PSYOP in competition with the most competitive sectors of the services and the general economy for talent and experience. Professionalization of military PSYOP requires specialization in the career field, and that field should offer the possibility of high rank.

Third, the rank of the senior PSYOP advisor in the theater is often much lower than that of the JTF principle staff that effective planning, coordination, and decision-making are severely impaired. PSYOP officers often have little direct access to the warfighting commander.

Fourth, PSYOP officers on staffs of the geographic CINCs lack the rank and the access to the CINC for effective long-range PSYOP planning, or for effectively coordinating the CINC's theater-operational PSYOP with national and transnational strategic-level international information campaigns.

The Task Force concluded that rank structure and career paths within PSYOP forces should be reassessed and more specifically:

- *the senior PSYOP advisor to the geographical CINCs should be an O-6 or equivalent civilian; and*
- *the commander of the Joint PSYOP Task Force supporting the Joint Task Force Commander (typically a three-star flag officer) in theater should also be an O-6.*

CHAPTER 3

Reaching the Target Audience

3.1 Packaging the Product

It bears repeating that the goal of PSYOP is to influence the behavior of the target audience. This presumes that the goal can be accomplished by influencing their perceptions. Critical, of course, is the theme of the message. But equally important is the packaging of the message, which must be suitable for the target audience and the dissemination media of choice. This requires considerable understanding of the target audience and their information milieu in order to tailor the message to the audience and choose dissemination media that can be expected to reach that audience.

Today's PSYOP force includes a small but dedicated cadre of country experts familiar with the cultures and fluent in the languages of their accounts. There is also a small and equally dedicated cadre of production personnel, operating a modest suite of production capabilities.

The Task Force considers it important for the PSYOP force to maintain some organic capability for in-house production. Situations arise that require an immediate response, and some situations may be of sufficient sensitivity that outsourcing would be undesirable. However, the Task Force also believes that consistent production of the highest quality products can be accomplished best by relying on a readily accessible set of professional firms that specialize in the desired products for the target audiences and chosen media.

The Task Force has concluded that OASD(SO/LIC) and USSOCOM should strive to improve overall product quality and recommends increased reliance on commercial providers for high-quality products. The Task Force believes, therefore, that the PSYOP force be adequately resourced and trained to engage a stable of commercial providers who can deliver these quality products.

In addition to training in acquisition skills, government PSYOP personnel require intensive instruction, refresher training, and hands-on familiarization with state-of-the-practice techniques across the spectrum of traditional and emerging media. This should ensure knowledgeable oversight and management of outsourced production, and likewise ensure that there are sufficient in-house skills to operate the modest organic QRC facilities. Once these in-house facilities complete their modernization changeover from analog to digital production, modest but continuing recapitalization may be required to assure compatibility with evolving media and state-of the-practice.

3.2 Developing the Message

Presenting the message so that it is compelling and credible requires a careful blend of creativity and sensitivity. The product must grab the attention of the target audience -- in a wholly positive way -- and leave the message with them in an unambiguous and memorable fashion. Unless a rough-and-ready message has special cachet, the more polished and professional the message is, the better. While there surely are dedicated and creative individuals in the PSYOP force, turning to commercial producers, where possible, is recommended. As previously mentioned, the Task Force recommends that the PSYOP force be adequately resourced to engage commercial providers, and adequately trained to get the most for the expenditure. However, background information required for framing the message and selecting distribution channels, most likely, must be supplied by the government.

Three sources of intelligence contribute to a capable PSYOP program. These are perhaps best described as proprietary information, classified intelligence, and information from the public domain.

Proprietary or privately held information requires considerable diplomatic expertise to acquire. It is best acquired through organizational interchanges, either among governments or non-government entities, or through contacts, meetings, international or transnational coalitions, and the like.

Classified intelligence supports PSYOP in largely traditional ways, except that the ratio between technical collection and clandestine collection is reversed -- that is, the raw information of most value to the conduct of PSYOP is often acquired by clandestine collection. To the extent that the necessary information comes from public and private sources, it should be reinforced through clandestine means as a quality check. A cooperative effort involving intelligence agencies and country teams (coalition, perhaps) is vital.

The Task Force observes that the PSYOP community must better specify the intelligence support it requires, especially for classified collection and tailored production. Currently, the PSYOP community seems to expect that the provision of tailored intelligence and other necessary information will be serendipitous. This is decidedly not the case, and raises a risk that the planning, execution, and assessment of PSYOP effectiveness will be based upon faulty information.

The Task Force believes that the Defense Intelligence Agency (DIA) should be tasked by the Secretary of Defense through his Assistant for C3I to establish a psychological warfare intelligence element. This element, in cooperation with the PSYOP community, should develop intelligence requirements, task the appropriate collectors (overt, technical, or clandestine), and analyze and produce finished intelligence products specifically meeting PSYOP needs. The PSYOP community should have representation within this DIA element, and DIA must be able to access the 4th PSYOP Group's research and analysis group. The DIA element should be authorized to coordinate fully with the other U.S. intelligence agencies, certain law-enforcement agencies, and U.S. and other allied information services.

In addition to proprietary information and classified intelligence, a considerable amount of information needed for the development and employment of PSYOP products is available via open source acquisition and an increasing amount of that information is available on the public Internet. The Task Force distinguishes between two kinds of open source acquisition activities. The first is simply the use of commercial contractors to provide suitable open source products to fit PSYOP needs. This would largely be geared to derivative products and non-Internet sources. In many cases, there are contractors who already supply a market with such information and the costs are merely subscription and licensing costs. In other cases, general products could be tailored to special PSYOP needs at minor cost. Even in cases where the contractor would be required to start from scratch to collect, organize, and synthesize such materials for the PSYOP community, the Task Force anticipates that one can negotiate favorable terms insofar as the contractor is permitted to re-purpose the materials for commercial customers. The second category of open source acquisition involves direct online access. A considerable and increasing amount of the information needed for the development and dissemination of PSYOP products is available on the public Internet. Harvesting that information -- often translating it, organizing it, and providing quality assurance -- is manpower intensive. And while it can be accessed by any individual analyst or tool developer, there are major economies of scale in doing it once, centrally and making it available for the community.

Because the Intelligence Community has declined the opportunity to aggressively organize the open source effort, it falls to individual organizations, such as the 4th PSYOP Group, to shoulder the burden themselves. The Task Force is unanimous in recommending that harvesting this information be done just once and well for the PSYOP community and, moreover, that it be made broadly available within the Department of Defense.

The Task Force believes that ASD C3I should be charged to either: (a) provide resources to the PSYOP community to implement a robust organic program of open source acquisition, or (b) task the Intelligence Community to fulfill the need for on-the-shelf, worldwide basic information, including the media and cultural background information that is necessary to adequately inform PSYOP products in a given country.

Military reservists offer a largely untapped personnel resource that can be profitably applied to the business of mining open sources for the technical and cultural information needed for the development and dissemination of PSYOP products. Unfortunately, reserve forces are not currently structured to optimize their potential contribution to this effort. The principal mismatch -- which, indeed, reflects an active duty problem -- is that the reserve forces are organized around the reservist's wartime Military Occupational Specialty (MOS). In this day and age, however, many reservists have civilian employment in information technology areas, which makes them especially suitable for this open source mission.

The Task Force is not ready to advocate major structural changes in the active reserves. However, there is a large reservoir of individual ready reservists (IRR) and individual mobilization augmentees (IMA) who could be formed into virtual units, disconnected from their earlier active duty service but especially suited to the 21st century Information Battlespace. The potential here is to use IRR and IMA personnel in virtual units, which would participate in "distance drilling" -- participating virtually in unit activities, even from home. And, of course, there are standing reserve intelligence units whose mission would require only a modest tweak in order for them to satisfy the PSYOP information needs more directly.

A prototype effort along these lines was sponsored, originally, by the Intelligence Community's Open Source Program Office, which used such online teams to organize and populate the online World Basic Information Library (WBIL). The WBIL program is now operated by the U.S. Army Foreign Military Studies Office (FMSO). Beyond the natural desire to serve their country, the individuals are motivated to "drill for points" so that the dollar costs of this effort are quite modest.

The Task Force also concluded that ASD C3I and Service Reserve Affairs organizations should review the WBIL program at FMSO, recognize the potential of reservists to meet, in a novel way, an otherwise languishing intelligence need, and provide the modest resources necessary to augment this effort.

To take full advantage of efforts like the FMSO WBIL will require the deployment to the PSYOP community of state-of-the-practice data mining software, connectivity, and computing power. The Task Force also notes, in passing, the need for ever more powerful data mining tools to keep up with the explosive growth in online information, which inevitably worsens the "signal-to-noise ratio" -- more wheat, but a lot more chaff; more nuggets, but a lot more ore to be refined.

Correctly choosing the media dissemination channels that reach the target audience is an essential element of PSYOP. This requires knowing the "market penetration" of the media, and the viewing, reading and/or listening habits of the target audience. Media penetration, particularly for electronic media, is a subject of constant commercial study, especially in North America and Europe. An admittedly somewhat cursory search for media penetration data for other regions of the world indicated that there is little or no information available. Those studies that do exist are generally available by subscription or on a selective, one-time-purchase basis. For purposes of long-term planning and quick reaction, these general data sets need to be acquired and on-the-shelf. This requires a certain attention span that is sometimes lacking in the case of the Intelligence Community -- as, for example, its lassitude with respect to global (open source) coverage. Absent a reinvigorated Intelligence Community open source effort, the local solution is to ensure that the PSYOP force has the resources to purchase these materials directly. It is important, however, to acquire and maintain these data sets, where available, for easy access by the entire national security community.

The Task Force encourages ASD C3I to make NFIP/JMIP funds available to USSOCOM for the express purpose of acquiring available data sets, particularly those for countries

outside North America and Europe. The Task Force also recommends that USSOCOM work with FMSO to ensure the integration of these data sets with the WBIL and their community-wide accessibility. Moreover, the Intelligence Community should be further tasked through ASD C3I to develop methods and sources to obtain media-use demographic information where it is not now available, and where the United States might plausibly have future national security interests in which PSYOP might be employed. The underlying premise is that the right business principle is to turn the "consumers" into "customers."

3.3 Brand Identity

The Task Force is persuaded that a considerable foundation must be laid well in advance of the actual need to deliver a PSYOP product to a particular audience. In general, the distribution channels need to be acquired in advance and a suitable "brand identity" needs to be established. Both need to be exercised with sufficient periodicity that good will and market penetration are ready when needed. Such channels and brand identities are at least as important as any technical dissemination platform such as *Commando Solo*, and their operations and maintenance are no less important. This will be increasingly the case as the diversity of programming choices available to target audiences continues to expand. Cable and satellite TV and radio, and especially the public Internet, offer far more choices than over-the-air networks did formerly. The development of channels and identities will be particular, in some cases, to geography and, in other cases, to transnational affinity groups -- Islamic Fundamentalism, for example -- or to more universal demographics, like teenagers. Of course, the development of brand identities must be tightly integrated with ongoing, broad public diplomacy initiatives and themes.

The Task Force notes that preliminary forays into the use of the Internet as a dissemination medium have been fraught with impediments, which the Task Force attributes to immature policy in dealing with the use of a medium that knows no national boundaries.

The Task Force believes, therefore, that OSD should work with the Department of State to fund, preposition, exercise, and maintain suitable distribution channels and brand identities, as far as can be reasonably anticipated for future PSYOP requirements. Policies regarding the use of new and emerging transnational media must be developed or refined. The Task Force highly recommends a liberal reliance on recognized professionals and generous use of highly qualified commercial entities; buying good content on which the messages will "ride" is a necessary and desirable expenditure. In some cases, the U.S. Government has unique content that it can make available.

It should be understood that the credibility and good will associated with a brand identity is capital that is built up over time, and in the actual event that capital may have to be depleted. If such good will has to be expended in a particular PSYOP, equivalent capacity should be restored at the earliest opportunity.

3.4 Measures of Effectiveness

- **Receivability:** How well did the physical message propagate to the intended area?
 - Could it be jammed?
- **Receipt:** How often did members of the target audience tune in to the message?
 - Did they have the right receivers? Could they read? Did they read and speak the language, dialect, and argot in which the message was framed?
- **Receptivity:** How favorably did the target audience respond to the message?
 - Did they change their behavior in a favorable direction? Did it matter?

Issues of receivability are the proximal cause of this Task Force study -- that is, Congressional interest in whether *Commando Solo* was sufficiently capable of propagating the desired media to the desired areas, or whether an improved platform were justified. Answers to questions about receivability are generally found in the physics of the situations -- broadcasts should be higher in the air, higher in the spectrum, higher in power, and so on. This being so, the modeling and simulation to forecast receivability is a reasonably well-established art. Moreover, simple physical measurements in the field can unambiguously answer the question of receivability -- although this is not always immediately feasible in denied areas.

The actual reception -- as opposed to the predicted "hearability" -- needs to be measured in the field, either directly or indirectly. This is necessary in the short term to improve the particular PSYOP. It is necessary in the longer term to refine the modeling and simulation tools to better reflect field conditions.

Of critical interest is the question of how favorably those in the target audience who received the message reacted. The bottom line, of course, is did they change their behavior in the desired way -- that is, did it matter? There is a need for behavioral modeling and simulation research. Again, field measurement is the ultimate test and is necessary to calibrate any models and validate any focus group pre-testing that may have been employed.

The Task Force recognizes that research in this area is most likely to be problematic. Notwithstanding, *the Task Force believes that DARPA should be encouraged to consider favorably any research that may further the goal of developing practical measures of effectiveness.*

CHAPTER 4

Future Trends in Media Creation and Dissemination

4.1 Introduction

The Task Force recognizes that the technological revolution currently transforming the TV and radio industries, telephony, and networking will assuredly have major effects on PSYOP content and dissemination. These three types of technology -- previously quite distinct -- are now rapidly mixing and blurring. Correspondingly, the distinction between *channels* and *content* is coming into much sharper focus since technology now allows one to send virtually any type of content across any type of digital transmission channel. As one simple example, the content of a radio station can now be sent worldwide by the Internet; it no longer relies on transmission through a geographically constrained RF channel. Figure 4.1 shows this revolution in schematic form.

Figure 4.1 Convergence of transmission networks

This chapter provides a brief survey of current mass media trends in these three arenas: TV and radio, telephony, and the Internet. Three major themes will emerge:

- Conventional terrestrial TV and radio are rapidly being rendered obsolete by novel, digital, and "converged" types of media.
- A complex and confusing array of incompatible new technologies is currently being fielded and it is extremely difficult to predict which of these will be successful.
- Broadcasting to mass audiences is quickly being replaced by narrow-casting to much smaller, more targeted audiences, and even by tailoring media streams for individuals.

4.2 Terrestrial TV and Radio

The most important contemporary trend in terrestrial TV broadcasting is the continued, seemingly inexorable cut-over from RF broadcast transmissions to cable systems. This migration is already well-advanced in many parts of the world, and it may even accelerate as cable systems begin to provide a full range of subscriber services, including telephony and high-speed Internet access. At the same time, however, broadcast High-Definition Television (HDTV) is being introduced in a number of incompatible formats across the world. Several less well-known, incompatible forms of digital radio broadcasting are now emerging for terrestrial stations and will likely be widely deployed in the next few years.

4.2.1 Cable TV

Cable TV build-outs are proceeding at very different rates in the different regions of the world, depending on factors such as local regulations and population density. Nonetheless, cable TV is clearly a major factor in television systems worldwide. For example, as shown in figure 4.2, within the next few years, almost 60 million European households will subscribe to cable TV service. The subscriber growth rate has been roughly linear in recent years, but it will likely increase as cable TV systems begin to offer a full range of telecommunications services (such as, telephony and Internet access) through the cable infrastructure.

Figure 4.2 Projected European cable TV penetration (Source: Frost & Sullivan)

Since cable TV offers obvious advantages over broadcast television -- such as excellent reception, an enlarged number of channels, and the possibility of subscription-based premium services -- it is likely to become increasingly popular throughout the world as cable plants continue to be built out. The implications for PSYOP and particularly for *Commando Solo* are clear: an ever-increasing number of households worldwide will be unwilling or unable to receive RF broadcast transmissions of TV signals. In addition, U.S. PSYOP will need to compete against a very large menu of commercial TV channels.

4.2.2 High-Definition Television (HDTV)

HDTV is a method of transmitting high-quality TV channels over the existing spectrum allocations for terrestrial RF transmission. As often happens, the Americans, Japanese, and Europeans have settled upon three incompatible formats, in part because of the regions' different TV spectrum allocations. The current Japanese version is analog; the Americans have settled upon a digital transmission method informally termed 8-VSB; and the Europeans prefer another method called COFDM. The technical specifications for these systems are quite complex and each allows a wide range of potential modes; the American version, for instance, allows 18 different transmission formats. Although the U.S. HDTV broadcast system is now nominally operational in at least one station in over 60 percent of the U.S. market, there appear to be recurring doubts as to whether 8-VSB provides adequate viewing quality over an entire coverage area. The FCC has rejected a petition to allow U.S. broadcasters to use COFDM. But even more recently (16 February 2000), the National Broadcasting Corporation's (NBC) Vice President for technical planning and engineering, Peter Smith, raised "extreme concerns" about the performance of 8-VSB based on field trials of both 8-VSB and COFDM. There is also some evidence the 8-VSB will not work with moving receivers (or transmitters) but that COFDM will since the European standard was explicitly designed to service mobile subscribers, such as televisions in cars and buses.

Meanwhile, the U.S. cable TV industry has shown few, if any, signs of interest in deploying a version of HDTV compatible with the U.S. broadcast industry. Rather than aim for a higher quality image in the same bandwidth, they prefer to employ digital techniques to further compress transmissions so that they can provide more channels. The Task Force does not know the plans for digital cable TV outside the United States.

It appears highly likely to this Task Force that broadcast television signals will, over time, transition from analog to digital. At this moment, however, the Task Force doubts that anyone has clear insight into how this transition will unfold, and even whether any of the current HDTV schemes will gain market acceptance in even limited geographic regions.

The implications for PSYOP are thus uncertain. If HDTV becomes widely successful, the PSYOP community would likely need to transition to creating higher quality digital media streams and to distributing them via digital broadcasts. Depending on the media encoding, such transmissions may be technically infeasible from moving platforms such as *Commando Solo*. Furthermore, the HDTV standards worldwide appear to be as fragmented as the current analog standards (NTSC, PAL, SECAM), so that PSYOP would need multiple HDTV systems in order to service all parts of the world.

4.2.3 Digital Audio Broadcasting (DAB)

Several efforts are currently under way to introduce a digital form of standard terrestrial radio stations. Since these new methods are digital, they are of course incompatible with

existing *Commando Solo* equipment. Outside the United States – primarily in Europe, Canada, and Australia – there is great interest in an L-band system called Eureka-147. Within the United States, at least two incompatible systems are being tested in the conventional AM and FM bands. One of these systems is now gathering increased attention worldwide for the AM bands.

Eureka-147. This European-designed system will operate in either the L-Band (1452-1492 MHz) or Band III (around 221 MHz). It operates at 224 kilobits per second with Musicam audio coding. Standardization is being carried out through the European Telecommunications Standards Institute (ETSI) on behalf of two trade organizations³. Figure 4.3 shows how a Eureka-147 receiver splits its received bit stream into both compressed music and an overlaid data stream that contains such information as song titles, performers' names, and so forth.

Figure 4.3 Conceptual schematic for DAB receiver

American DAB Systems. The Eureka-147 system has been rejected for use in the United States since its L-band spectrum is reserved for telemetry. Instead, two incompatible U.S. schemes⁴ have been proposed for use in the current AM and FM bands. Both schemes preserve the existing analog stations but also overlay new, higher quality digital versions in the same bands. The FCC is well under way to approving these systems.

The U.S. System Worldwide – Digital Radio Mondiale. The U.S., legacy-compatible approach to DAB has proved appealing enough that it is now being pursued worldwide under the auspices of a consortium known as the Digital Radio Mondiale⁵ (DRM). DRM's goal is to develop a standard for digital broadcasting in the AM bands below 30 MHz. DRM has lodged its proposal for a digital standard with the International Telecommunication Union (ITU) and aims to start broadcasting in late 2001, with receivers entering the marketplace at about the same time.

³ The World Forum for Digital Audio Broadcasting (www.worlddab.org) and the Eureka 147 Consortium (www.eurekadab.org).

⁴ One is proposed by USA Digital Radio (www.usadr.com), the other by Lucent (www.lucent.com).

⁵ Web site (www.drm.org).

4.3 Satellite TV and Radio

The Task Force notes that space-based TV and radio systems are already widely deployed throughout the world and they too are beginning a transition to digital formats. This section provides a very brief sampling of current trends in satellite dissemination systems. Such systems are proving extremely popular in the developing world since they can be rolled out very quickly and cheaply.

These satellite systems pose several technical challenges for a mobile PSYOP dissemination platform such as *Commando Solo*. First, the media encodings are digital, and sometimes proprietary, and often encrypted. Thus, they cannot be serviced by *Commando Solo*'s current transmission suite. Second, the receivers employ satellite dishes pointed to specific slots in geosynchronous orbits. It will not be easy for a platform such as *Commando Solo* to transmit in such a way that it can be received in these dishes. Third, the satellite systems operate on a variety of bands (L, C, Ku) not currently supported by *Commando Solo*.

Satellite TV. Although U.S. viewers are perhaps most familiar with U.S. systems such as DirecTV, a great many non-U.S. systems currently provide service to other parts of the world. This section briefly discusses one representative system, AsiaSat⁶, which should provide an adequate illustration of the competition that *Commando Solo* is now encountering. AsiaSat currently operates three satellites using both the C and Ku bands. Figure 4.4 shows the footprint for its geosynchronous AsiaSat 2 satellite.

Figure 4.4 AsiaSat 2 TV and radio coverage in C and Ku bands

The AsiaSat 2 channels are broadcast in several different digital encodings. One common encoding is MPEG-2/DVB, QPSK modulation, symbol rate: 4.42 Msym/sec, FEC: $\frac{3}{4}$. It is instructive to peruse the TV and radio channel listings for the AsiaSat 2 C-

⁶ Web site: www.asiasat.com.

band⁷, as it shows the very wide variety of programming already available to developing-world subscribers. This one band provides at least 25 TV channels and a number of radio channels from a variety of sources around the world. Similar menus are provided for AsiaSat 2 Ku-band and AsiaSat 3 C-band. Consumers in these regions can thus receive quite a wide and entertaining mix of TV and radio channels through typical 18" satellite dishes.

Satellite Radio. The Task Force received a briefing from WorldSpace Corp.⁸ on its new satellite radio system, which is currently well on its way to becoming operational. Accordingly, this section discusses the system as an example of satellite radio. WorldSpace does, however, have competitors in the satellite radio business⁹. Figure 4.5 shows the beam footprint for Worldspace's AfriStar satellite alongside a Hitachi-built receiver for WorldSpace broadcasts. Corresponding satellites for Asia and South America will be launched mid- and late-2000.

Figure 4.5 AfriStar satellite coverage and satellite radio receiver

The WorldSpace system is fully digital and transmits a number of stations simultaneously in the L-band. Each station is a separate audio stream encoded in a variant of MPEG-3 audio. Different streams can be sent at different bit-rates; each stream occupies some multiple of 16 Kbps in the overall TDMA plan. Stations can switch encodings "on the fly" so that a number of language-specific commercials can be embedded in the same program by encoding each of the commercials at a lower rate than the overall rate for that station. The total number of channels thus depends on the exact coding rates chosen for each channel, though there will likely be more than 25 channels in each satellite beam.

⁷ Saudi (TV and 2 x radio), Myanmar TV, Chinese provincial TV (Guangxi, Shaanxi, Anhui, Jiangsu, Heilongjiang, Jilin, Henan, Qinghai, Fujian, Jiangxi, Liaoning, Inner Mongolia, Guangdong, Hunan, Hubei), Papua New Guinea TV, Egyptian Space Channel, Fashion TV, RTPi TV, Antena 1 Radio, Sky Channel, TVSN, Voice of America, Worldnet, Reuters TV, BBC, AP Television News, Voice of America, Worldnet, CCTV - Channel 4, Deutsche Welle TV and Radio, French TV5, TVE Internacional of Spain, MCM France, RAI International Italy, Radio Finland YLE, Radio France Internationale, Radio Netherlands - de Wereldomroep, World Radio Network, Radio Canada International, Swiss Radio International, Radio Exterior de Espana.

⁸ Worldspace Corp. web site: www.worldspace.com.

⁹ For instance Sirius Radio (www.siriusradio.com) has targeted U.S. consumers for a fee-based system in alliance with various car manufacturers.

Since the WorldSpace system is fully digital, it will convey data in addition to the audio streams. At the very least this will include the names of the songs and performers. WorldSpace Corp. also expects to transmit Internet web content via this means, though the Task Force believes that their system capacity may be somewhat too low for this to be commercially feasible.

Taken as a whole, increasing market penetration for satellite TV and radio poses two distinct problems for U.S. PSYOP. A narrow, technical problem is that U.S. forces have no available means to disseminate their PSYOP content to households that rely upon satellite services. In particular, the *Commando Solo* aircraft cannot provide this function for the variety reasons listed at the start of this section. A much wider problem, however, is that the PSYOP message now needs to compete against a very rich entertainment menu. As a result, it will become increasingly difficult for the PSYOP community to acquire "mindshare" in its target audiences.

On the other hand, as satellite systems become highly subscribed in one or more regions of the world, they offer an appealing medium for PSYOP dissemination since a single system generally offers full continental coverage at relatively modest cost. The insertions of PSYOP "commercials" and "specials" into existing, branded channels could prove a highly effective, and cost-effective, means for disseminating PSYOP content. Here DoD might wish to become an "anchor tenant" within new systems in order to ensure that such channels exist and are available for DoD use.

4.4 Media Trends in Telephony

As will be discussed, wireless telephony is very rapidly being built out across the world, and there is great interest in evolving cellular telephony systems into multimedia systems by providing higher data rates and non-voice services. This would then allow cellular systems to be used for dissemination of TV, radio, and web content. On a parallel, but unrelated, front the tight integration of computers with fax and voice dial-out systems has begun to allow widespread and economical delivery of voice and graphic messages through the public telephone system. Both these trends offer some promise as new ways to disseminate PSYOP content.

Cellular, PCS, and Wireless Local Loop. Both the developed and developing worlds are building out wireless telephony infrastructures very quickly. It is, however, difficult to provide aggregate worldwide growth figures since commercial market intelligence is generally carried out country by country. Table 4.1 shows a typical projection. Similar growth rates are expected for large areas of South America and Asia. Unfortunately, the technology base for wireless telephony is fragmented among a number of incompatible schemes (GSM, CDMA, TDMA, and various wireless local loop technologies). This makes it impossible to create a universal wireless telephony solution that is applicable worldwide.

Year	Subscriptions (000s)	Revenues (\$ millions)	Revenue Growth Rate (%)
1994	423.0	464.5	---
1995	1,313.5	1,407.2	202.9
1996	2,580.4	2,337.4	66.1
1997	4,414.0	4,048.0	73.2
1998	7,798.7	5,302.4	31.0
1999	12,086.4	7,215.6	36.1
2000	14,987.1	7,658.4	6.1
2001	18,134.4	8,559.4	11.8
2002	20,220.8	9,159.6	7.0
2003	22,060.9	10,147.5	10.8
2004	23,891.8	11,682.6	15.1

Table 4.1 Cellular / PCS subscriber and revenue forecasts for Brazil, 1994-2004 (Source: Frost & Sullivan)

Data-Enabled Cellular Systems. Cellular equipment manufacturers and service providers are currently rolling out data services as fast as possible. A confused assortment of protocols are currently vying for market share -- representative examples include Short Messaging Service (SMS), General Packet Radio Service (GPRS), Wireless Access Protocol (WAP), Cellular Digital Packet Data (CDPD), and others. Some of these are directly Internet-compatible, while others require gateways to the Internet. None has significant market share yet, although the only really widely available system, NTT DoCoMo in Japan, currently claims a million subscribers for its cellular data system with 40,000 new customers being added each month.

Figure 4.7 Emerging trends in wireless telephony (cell-phone) technology

As consumer interest in data service increases, today's cellular systems will need significant overhauls in order to efficiently provide high-bandwidth data services. Figure 4.7 pictures something like the current state of the art on the left, namely simple text messaging, and the hoped-for future to its right, namely full motion video and web browsing. The exact path by which current cellular systems will evolve to these future so-called "3G" systems is by no means evident. A number of potential migration paths have been proposed and a variety of incompatible upgrades are now being fielded. It is unclear to this Task Force when, and indeed if, these hoped-for upgrades will actually transform the voice cellular system into a data-centric system.

Computer Telephony Integration (CTI) – Automated Call-Out and Fax Broadcasts. For some years, computers have been tightly integrated with telephony systems in large call centers (for example, for telemarketing). Such systems combine the database functions of computers with voice and/or fax systems in a number of ways. Such systems can, of course, be used for delivery of arbitrary voice and graphic messages, either by call-in (where the other end places the call) or by call-out. In the most extreme form, CTI systems are used for voice and/or fax broadcast. Here, a single voice or fax message is delivered to a potentially unlimited number of recipients. In essence, an operator provides a voice recording or file containing a fax document, together with a list of thousands or tens of thousands of phone numbers, and the computers place a number of calls one after another to deliver the message to each of its intended recipients. Since the computer can tell whether a message has been fully delivered or not, it can keep placing a call or sending a fax until it has been successfully delivered. The computers can also distinguish a human respondent from a fax machine, and deliver a voice message to the former but a graphic document to the latter.

Such voice and fax broadcasts can be implemented in-house or out-sourced to any of a number of companies. Simple arithmetic shows the potential PSYOP impact of such technology. If each call takes 30 seconds, a single calling interface can place two messages per minute, or 120 per hour. Ganging 100 such interfaces can thus deliver 12,000 messages per hour, which can accommodate a mid-size town. In addition, international phone rates are falling rapidly; at today's best consumer rate of 10 cents per international minute, such a fax or voice message broadcast costs only \$1,200. This rate is likely to plummet in the near future as additional capacity comes online.

4.5 The Internet

The Internet is, of course, the dominant feature of the "new media" in our time. However, since it is large and highly decentralized, there are no definitive measures of its actual size or growth rate. For this study, the Task Force has relied on the most recently published figures (December 1999) from Telcordia's Dr. Christian Huitema, a well-respected researcher who produces monthly estimates¹⁰. Overall Dr. Huitema estimates the total number of Internet users at somewhere between 295.0 and 398.8 million, though

¹⁰ <http://ftp.telcordia.com/pub/huitema/stats/dec99.html>

of course this number is very hard to pin down. He further estimates that 78.9 million computers were directly attached to the Internet in December 1999, which is an annual increase of 36 million computers (84 percent) from the estimate of 42.9 million computers in December 1998. This figure represents those computers listed in the global Domain Name Service, and hence it represents only a subset of all computers that can access the Internet. For example, it does not include most home computers that connect via dial-in lines. The regional breakdown of Dr. Huitema's figures is as follows: United States, 60.7 percent; Europe, 24.2 percent; Asia, 12.2 percent; Latin America, 2.3 percent; and Africa, 0.7 percent. Note that even the relatively low percentage for Africa represents over half a million computers.

Web Sites. Web sites are so widely known that this report shall skip all discussion of them except to briefly remark that they are quite suitable for dissemination of PSYOP content.

Email. Email is probably the predominant means of communication for Internet consumers and could also be an excellent medium for PSYOP. It would be rather easy to find a large number of email addresses for users in a country, and then begin to send them email. This can be blocked, but such blocking is generally done by the receiving organization rather than by the service provider. Hence, one might expect a rather porous barrier to unsolicited email into a country. This email could of course contain images and sounds in addition to text. If desired, each message could be tailored to an individual recipient, thus providing some rough form of geographic tailoring and helping to keep opposing authorities somewhat in the dark about what everyone is receiving.

Chat Rooms and Messaging. Internet chat rooms may also have potential PSYOP uses, in that "guided discussions" could perhaps be used to influence how citizens think about certain topics. This example is already in practical use with the candidates in the U.S. presidential elections. China has begun to set up monitored chat rooms so its citizens can discuss a wide range of matters. In the Chinese approach, offending messages are deleted before, or just after, they have been sent to everyone. Such chat rooms might be a way to allow citizens of a country to air their grievances. While the originating point of a chat message is not hard to discover, there are ways around such monitoring. In China, for instance, a great many chat messages come from Internet cafes, and so cannot be traced back to specific people.

4.5.1 New Forms of Wireless Internet Access

The first "pure Internet" wireless networks are just beginning to emerge within the United States. Such networks are entirely designed for Internet devices; they are technically quite different from telephony systems, which have had the primary design goal of carrying human speech. Figure 4.8 shows a typical wireless Internet device (Palm VIITM) side by side with a network schematic for the RicochetTM network by Metricom¹¹. The Task Force does not have detailed market estimates for wireless Internet access, but Killen & Associates has forecast a 71 percent compound annual growth rate for this

¹¹ Metricom web site: www.metricom.com.

market, from \$1.3 billion in 1998 to \$19.2 billion in 2002. These figures include access through cellular systems as well as “pure Internet” systems.

Figure 4.8 Wireless Internet devices and metropolitan wireless Internets

At present, Ricochet™ is the only wireless Internet suitable for hand-held or vehicle-mounted devices and operational on a metropolitan level. It operates solely within the United States. The current Ricochet™ network covers the San Francisco bay area, Seattle, and Washington, DC, as well as a number of U.S. airports. It employs a proprietary frequency-hopping radio that operates in the ISM band. Within the past year, however, Metricom has had a significant infusion of funds (\$1.2 billion) in order to build out a higher speed version of this network across all major U.S. cities. When operational, this network will provide relatively high-speed (128 Kbps) and secure Internet access to any device that has a Metricom modem. Interestingly, these networks are much cheaper to build than those based upon cellular telephony technology, yet they will likely provide noticeably higher performance.

Since both the Internet and mobile wireless fields are extremely active and well-funded at the moment, the Task Force expects that a number of other companies will also begin to build out such networks in the coming year or two. At present there are some regulatory barriers to building such networks in various parts of the world (particularly Europe and Japan), where lower ceilings on the maximum allowable transmission power make such metropolitan networks economically infeasible. It seems likely, however, that such systems will eventually be built throughout the world.

4.5.2 The Internet and the Coming Impact of Fiber Optics

As interesting as the preceding technologies are, the Task Force believes that by far the most important technology driver for the next decade will be the extremely high-bandwidth fiber optic cables across which the Internet will run. Everything described above is an evolution of existing technology. The coming ultra-high-speed Internet technology, however, will be completely revolutionary. As a result, it is exceedingly

hard to predict. But a glance at figure 4.9 shows the magnitude of the changes that are almost literally on today's doorstep.

Figure 4.9 The build-out of extraordinary Internet bandwidth in the suburban United States

Figure 4.9 shows a typical Boston suburban street with a 288-fiber cable pulled by RCN Corp. during 1999 to provide a new residential communications infrastructure. Running with current top-of-the-line commercial equipment, this cable provides full-duplex bandwidth of about 23 terabits to a small region of the town. Broken down by household, that comes to more than 10 gigabits/second per house. Translating that bandwidth into TV and radio shows the extent of this revolution. A single HDTV channel occupies something less than 20 megabits/second. Thus, a given household could have as many as 500 HDTV channels streaming into it simultaneously -- with *none* of these channels shared with any other house in the town. Obviously, no house is going to receive 500 TV stations simultaneously, so if indeed the bandwidth is ever fully used, it will be used by something other than TV or radio. Thus far, of course, the driver has been the Internet, with its seemingly insatiable appetite for bandwidth.

Surprising as it may seem, the developing world probably will not lag terribly far behind the United States in Internet build-out. Today, for instance, although less than 5 percent of China's small companies have ever used Internet services, Frost & Sullivan estimates that over 50 percent are likely to go online within the next five years. Figure 4.10 shows projected annual sales of fiber optic cabling worldwide. The yearly production (and deployment) of fiber is expected to nearly double between 2000 and 2006.

Figure 4.10 Projected worldwide market for fiber optic cables (Source: Frost & Sullivan)

As can be seen from table 4.2, the highest growth rates for fiber optic cabling occur outside North America and Europe. In particular, the least developed parts of the world are projected to have compound annual growth rates (CAGR) of over 50 percent, though of course from a very small base.

Year	North America	Europe	Asia Pacific	Latin America	Rest-of-world
	(\$ millions)	(\$ millions)	(\$ millions)	(\$ millions)	(\$ millions)
1996	1,582.9	1,039.7	739.2	89.8	2.6
1997	1,681.2	1,228.8	895.8	154.6	3.4
1998	1,800.0	1,433.8	1,053.0	188.2	5.7
1999	1,856.0	1,650.9	1,255.7	230.1	10.0
2000	1,839.4	1,872.4	1,503.4	269.8	22.0
2001	1,826.1	2,002.1	1,790.3	316.3	32.8
2002	1,778.3	2,103.4	2,084.3	363.3	44.6
2003	1,794.7	2,189.4	2,283.7	404.2	64.7
2004	1,762.1	2,278.7	2,491.0	452.9	92.0
2005	1,784.1	2,213.4	2,746.4	510.8	148.1
2006	1,788.2	2,158.2	2,998.4	562.7	200.4
CAGR 1999-2006	(0.5)%	3.9%	13.2%	13.6%	53.4%

Table 4.2 Total fiber optic cable market: revenue forecasts, 1996-2006 (Source: Frost & Sullivan)

Even in the next few years, the Internet is likely to have a major impact on the distribution of radio and TV content within the United States and, a little later, in other parts of the world. Indeed, this process has already begun, though it is currently hampered by the very low bandwidth available in typical homes (53 thousand bits/second at most).

Internet Radio Stations. In recent years there has been an explosive growth of radio stations transmitting real-time audio streams through the Internet. One MIT database records more than 9,000 radio stations transmitting through the Internet¹². Any of these stations can be heard anywhere in the world by anyone who has a cheap PC and an Internet connection. The list of stations already available online is perhaps even more interesting than the sheer number of such stations¹³.

Internet TV Stations. More surprisingly, a number of TV stations are already transmitting through the Internet even though the typical household bandwidths are not yet high enough for satisfactory TV quality. A quick search of one vendor's web site¹⁴ found 85 TV stations broadcasting through the Internet. Transmissions originate in such countries as Brazil, Cyprus, Peru, Russia, Bahrain, Korea, Philippines, Slovenia, Croatia, and India. The Task Force expects the number of such stations to grow very rapidly once cable modems, ADSL, and other high-speed consumer Internet technologies have reached a critical mass.

Audio and Video On Demand. Of course it is a mistake to conceive of the Internet only as a replacement of conventional radio and TV stations. Even when restricting the discussion to only audio and video media, the Internet brings the enormous advantage of being able to supply media clips on demand. Thus, it is rapidly emerging as an important distribution medium for popular music and, in time, it will likely be a prevalent means for distributing video products. Table 4.3, which forecasts the number of free Internet audio players that will be downloaded in the coming years, gives some notion of the projected size of these markets. At present, Internet audio companies offer promotional audio files in order to entice users to use their software products. These free audio files also attract end users to purchase the full CD of the featured artist. By 2001, a wide variety of popular music content is expected to become available and the number of paid audio files is projected to rise to 28 percent of total audio downloads. By 2005, 52 percent of audio downloads are expected to be paid for, while 48 percent of audio downloads are projected to be free and used for promotional purposes.

1996	0	---
1997	5.8	---
1998	39.5	581
1999	43.4	10
2000	53.8	24
2001	65.1	21
2002	84.7	30
2003	96.4	14
2004	102.5	6
2005	126.3	23

Table 4.3 Forecast of free Internet audio player downloads, 1995-2005 (Source: Frost & Sullivan)

Trends in Personalization of Web Pages and Media Streams. Internet radio and TV stations will be further distinguished from their classic predecessors in that they will be highly personalized. The preferences of each customer will be maintained in a database and the media stream flowing to that customer will be tailored accordingly. Each customer will receive his or her own personalized stream of media content and commercials, targeted as carefully as the media supplier can manage. The first results of this technology are already widely deployed in personalized web pages and Internet storefronts. A "My Yahoo" page, for example, contains content tailored for the individual consumer, and the Amazon.com online store records previous purchases in an attempt to suggest tempting new offerings when a consumer re-appears. In a sense, such technology takes "narrow-casting" to an extreme -- it is precisely the *opposite* of broadcasting.

4.6 Other Media

A number of other media types, and means of dissemination, are also widely popular. Video games are perhaps the most popular. They can be disseminated by a number of techniques, ranging from diskettes to web downloads. Internet games allow a number of geographically dispersed players to participate in a large, shared virtual space. Web animations are also popular, as are Java applets. Other important media at this moment include CDs, CD-ROMs, and DVDs. All are suitable for PSYOP in some situations.

4.7 Summary of Media Content and Dissemination Channels

Table 4.4 shows a number of potential types of content (columns) and how such content can be mapped onto a variety of channels (rows). Those intersections marked with a "Y" are those in which a given type of content can be carried via a given medium. Shaded

areas indicate content that can be created and disseminated by traditional PSYOP. Only a very small subset of the potential types of content fall into this category.

Channel / Content	Broadcast?	Video	Audio	Text / Photo	Short Message	Interactive Voice	Interactive Web	Video Game
Radio								
AM / FM	Y		Y					
Shortwave	Y		Y					
Digital	Y		Y		Y			
Satellite	Y		Y					
Television								
VHF / UHF	Y	Y	Y	Y	Y			
Cable	a	Y	Y	Y	Y			
HDTV	Y	Y	Y	Y	Y			
Satellite	Y	Y	Y	Y	Y

Cassette			Y					
CD			Y					
CD-ROM		Y	Y	Y				Y

Table 4.4 Content types and distribution channels

Notes:

a. Cable is typically transmitted through coaxial cables. This would make it hard to insert content without permission from the cable's operator. Some parts of cable distribution systems are microwaves, however. In addition, some distribution to users is via RF (for example, MMDS and LMDS in the United States).

b. Although these media appear to be broadcast, in fact they are implemented by a number of individual sessions much like individual phone calls. These individual sessions are generally traceable by the operators of the local Internet service; hence, privacy cannot be guaranteed. In addition, entire web site addresses can be blocked rather easily by a local Internet service.

c. These media can be broadcast by the repeated sending of the messages to individual destinations. Since this is automated, it takes little trouble, but it does take a certain amount of transmission capacity to send so many duplicated messages. In addition, these transmissions can easily be monitored and/or blocked by the local Internet and telephone service providers.

d. As with the classic web, these features are easily monitored and/or blocked, assuming that the local Internet service provider can determine the addresses of the chat / messaging sites.

e. Basic cellular and satellite telephone service is one-to-one rather than broadcast. However there might be certain features of some cellular technology that would allow insertion of broadcast messages (audio or text).

f. Basic paging service is one-to-one rather than broadcast. However many pager technologies include groups (for example, for stock market or news updates). These could probably be used for short message delivery.

4.8 Findings

The following are the Task Force's findings on current and future trends in media creation and dissemination.

Fundamental Changes in Media and its Dissemination. The Internet is the most obvious sign of media change, but in fact change is occurring on all fronts. Conventional terrestrial broadcast of TV and radio grows ever less important as consumers switch to cable and direct-to-the-home satellite. Geographic broadcasting is breaking down as satellites broadcast TV and radio channels worldwide. Many thousands of radio stations are now broadcasting through the Internet. And web sites are rapidly becoming a new and as-yet unknown blend of media sites, newspapers, and discussion forums.

Unstable, Rapidly Changing Technology. The worlds of media content and media dissemination are currently in a state of extraordinary flux. Technological innovations are occurring at a rapid pace and impacting deeply enough to fundamentally alter the structure of the world economy. The stable world of conventional broadcast TV and radio is rapidly vanishing and in its place a large variety of new and incompatible technologies are being fielded around the world. No one can tell which, if any, of these new technologies will emerge victorious. But it seems evident that this unstable, rapidly changing environment is likely to last for years or perhaps even decades.

Narrow-casting. All current media trends lead away from the old broadcasting model in which a large number of consumers all receive a relatively small number of widely shared content streams and toward a tightly targeted narrow-casting model. At present, many consumers have hundreds of media channels at their fingertips. Very quickly, even the narrow-casting model will be superceded as media streams are specifically designed for individual consumers. Very large consumer databases will ensure that each consumer receives a stream of images, sounds, and advertisements that are aimed precisely at his or her taste.

Based on these trends, the traditional use of TV and radio broadcasts from an airborne platform (*Commando Solo*) is becoming a less effective method to disseminate PSYOP products in a tactical setting. Consumers in many parts of the world have access to a very wide range of media -- indeed, many may not even be able to receive *Commando Solo* broadcasts of UHF and VHF TV because they have cable or satellite TVs. The consumer's center of gravity is rapidly shifting to the Internet. Broadcasting is no longer how the media works. Instead, everything is becoming more tightly focused as the number of distinct media channels grows ever larger.

CHAPTER 5

FM and TV Broadcast from Aircraft

5.1 FM and TV Broadcast from Aircraft

A critical element of tactical PSYOP has been radio and TV broadcasts from a standoff airborne platform. Transmissions from aircraft altitudes offer an advantage over terrestrial transmissions because obstacles standing between transmitter and receiver in terrestrial transmissions -- such as vegetation, buildings, and terrain -- attenuate transmitted signals and degrade reception. For this reason, aircraft allow access to relatively large areas. The effective range of a transmitter generally improves with altitude, but it is subject to frequency-dependent absorption, reflection, and diffraction. In addition to the broad coverage made possible by altitude, an aircraft broadcast platform can be deployed anywhere on the globe and begin operating in a short amount of time. An element of survivability is also gained over fixed or even portable terrestrial stations.

Radio broadcasts occur in HF, VHF, or UHF. Commercial and government-sponsored radio broadcasters transmit amplitude modulated (AM) signals in the so-called AM band (535 to 1700 kHz) and in any of several short-wave (SW) bands ranging from about 2.3 MHz to 22 MHz. Frequency Modulated (FM) radio broadcasts occupy the FM band, which spans 88 MHz to 108 MHz. TV broadcasts, because of their much higher bandwidth, are confined to VHF and UHF in several TV bands: 54 to 72 and 76 to 88 MHz (VHF-L), 174 to 216 MHz (VHF-H), and 470 to 608 and 614 to 806 MHz (UHF).

The *Commando Solo* aircraft is the only current airborne asset equipped for broadcast PSYOP. A fleet of six EC-130E *Commando Solo* aircraft are operated by a reserve unit. Each is equipped with radio and TV transmitters covering HF, VHF, and UHF commercial and military bands and a variety of other equipment needed to broadcast messages in audio and video formats. The aircraft have six 1-kW transmitters -- two for VHF-L, two for VHF-H, and two for UHF -- and one 10-kW power amplifier that can be operated on VHF or UHF. Separate antennas for VHF-L, VHF-H, and UHF run along each side of the aircraft. Providing 6 to 9 dB gain, these antennas must be switched when the aircraft turns along a typical racetrack pattern. The received signal is degraded or lost during turns. When operated, *Commando Solo* transmitters saturate the front-ends of onboard communications and navigation equipment -- a problem that should be addressed and resolved with high priority.

The effective range of a broadcast transmitter is governed primarily by antenna height, effective radiated power (transmitted power multiplied by antenna gain), transmitted frequency, and receiver noise characteristics. Though the details of governing relationships are complex and usually treated by computer models, simple rules can be applied to predict overall performance.

The distance from the antenna to the earth's horizon is a very important parameter. For an idealized, spherical earth, this distance is the square root of two times the geometric

mean of antenna height and earth radius. This distance, d , scales as the square root of antenna height,

$$d = \sqrt{2 \cdot h_T \cdot R_0},$$

where h_T is the transmitter antenna height and R_0 is the earth's radius. Increased antenna height improves range, but doubling the height (an ambitious proposition) increases range by only about 40 percent.

For a spherical earth, a clear line of sight exists between the transmitter and a receiver antenna on the earth's surface inside this distance. Raising the receiver antenna increases the line-of-sight range by a term identical to the above equation, so the line-of-sight range becomes

$$d = \sqrt{2 \cdot h_T \cdot R_0} + \sqrt{2 \cdot h_R \cdot R_0},$$

where h_R is the receiver antenna height. The second term in this equation is dominated by the first when h_T is an aircraft altitude. Terrain, surface material properties, vegetation, and atmospheric conditions all influence the "actual" line-of-sight range; however, as a general rule, higher transmitter and receiver antennas imply greater range and the situation improves as the square root of height of either receiver or transmitter. Table 5.1 serves as an illustrative example where the receiver antenna is assumed at zero height.

Approx. antenna height (kft)	Range to horizon (mi)	Platform
1	39	Typical TV antenna tower
20	174	EC-130E, EC130J
40	245	Widebody aircraft (eg. Boeing 767)
60	301	Global Hawk, Gulfstream

Table 5.1 Antenna height and range to horizon

Table 5.1 shows that a receiver with clear line of sight to a 1,000 ft tower 39 miles distant would also have a clear line of sight to an EC-130E at about 20,000 ft and 174 miles distant. This table and the preceding equation can be used to roughly estimate effective transmitter range so long as transmitted power is sufficient for line-of-sight communications, or sufficient to overcome so-called R-squared losses. The point is that beyond ranges shown in table 5.1, signals begin degrading in a different way (a higher power of range or even exponentially) and much more rapidly with increased range.

Table 5.2 lists distances typical of operational constraints placed on an airborne broadcast system.

Target audience	Aircraft location	Distance (mi)
Belgrade	Hungarian border	100
Belgrade	Romanian border	50
Baghdad	Saudi border	250
Teheran	Persian Gulf	>300
Teheran	Turkey border	>300
Pyongyang	Korean Sea	40-50
Pyongyang	DMZ	80-100
CINC requirement for radio and TV		300

Table 5.2 Operational constraints on airborne broadcasts

Comparing the two tables above, it becomes clear that the current Commando Solo aircraft, the EC-130E, is inadequate for many scenarios even in an idealized situation. Given the real-world issues of obscuration by terrain, vegetation, and buildings, plus the need to fly somewhat behind a political border in order to avoid surface-to-air threats, it is clear why Commando Solo is most effective when transmitting into island or littoral nations. It is also worth noting that the CINC requirement for a 300 mile range may not be large enough to address several important scenarios.

The EC-130E platform currently used for Commando Solo flies at 18,000 feet. There is interest in cross-decking the existing Special Mission Equipment (SME) to an EC-130J platform that would fly at 24,000 feet. This increase in altitude would have only a marginal impact on Commando Solo performance and the Task Force is concerned that the SME hardware represents very old technology and thus projects major weight, size, and power restrictions on any platform that carries the current hardware. The Task Force is also concerned that the debate has focused on the platform and not the payload - the critical information transport mechanisms in support of PSYOP missions.

Effective radiated power is another important parameter determining broadcast range. When transmitter and receiver antennas are within line of sight, the received signal scales inversely with the range squared -- doubling the range requires four times the power to maintain the same signal quality. Beyond line of sight, this relationship becomes much more complicated. Absorption, scattering, diffraction, and reflection of energy from the transmitter are a strong function of frequency and can vary considerably with time of day, time of year, and even solar activity. Table 5.3 provides a qualitative summary of these effects.

Transmission type	Frequency range (MHz)	Band	Beyond LOS propagation
AM radio	0.535 - 1.7	AM	Reception beyond LOS due to diffraction; much longer range at night due to ionospheric reflection, some variation with season and sunspot cycle
FM radio	88 - 108	FM	Degraded reception beyond LOS; some absorption in foliage and other obstacles; some seasonal variation with foliage
TV	54 - 88	VHF-L	Degraded reception beyond LOS; some absorption in foliage and other obstacles; some seasonal variation with foliage
TV	174-220	VHF-H	More degraded reception beyond LOS; more absorption in foliage and other obstacles; some seasonal variation with foliage
TV	470 - 800	UHF	Highly degraded reception beyond LOS; significant absorption in foliage and other obstacles; more seasonal variation with foliage
Analog and digital telephony	50 - 400	VHF & UHF	Varies with frequency, as described above

Table 5.3 Effectiveness of transmissions from beyond line of sight

The dependence of propagation strength on frequency is also illustrated by typical effective radiated power for U.S. broadcasters: AM radio ≤ 20 kW, FM radio ≤ 200 kW, VHF TV ≤ 300 kW, UHF TV ≤ 5 MW. The largest AM radio stations on clear channels reach 1,000 miles or more at night while UHF and VHF TV stations with large antenna towers and high power typically reach 100 miles or less depending strongly on receiver antenna gain and height.

Other important factors determining broadcast range are receiver quality and bandwidth. Receiver quality in the AM band is less important than for VHF and UHF because atmospheric noise tends to dominate signal quality below 30 MHz or so. In the VHF and UHF, however, noise generated by the receiver is important and so newer receivers will tend to be useful with weaker signals. This is particularly true for the UHF. Larger bandwidth implies more receiver noise, so the audio portion of a TV transmission is typically useful beyond the range where the video becomes unacceptable. This effect is, to some extent, a result of the modulation and demodulation techniques used (typically FM for audio and AM for video) and of differences in the way noise is perceived on audio and video information.

Table 5.3 illustrates why *Commando Solo* performance is best for AM radio broadcasts and poorest for UHF TV broadcasts. All *Commando Solo* systems worked well in Haiti, Panama, and Grenada, as would be expected from tables 5.1 and 5.3. Radio broadcasts worked acceptably in Iraq and Kosovo, while TV broadcasts were not satisfactory. During the Kosovo campaign, *Commando Solo* was orbiting at 18,000 to 20,000 ft over Hungary -- about 100 miles from Belgrade. Transmitting 10 kW on UHF channel 21, the video quality was unacceptable while the audio was understandable, again in general agreement with the above discussion even though many details are omitted.

The above discussion and the Kosovo experience can be used to predict, with some confidence, how various options will perform if called upon in future military operations. Table 5.4 summarizes these qualitative predictions assuming a clear channel for each case.

Target audience	AM	FM	VHF TV	UHF TV
Island nations	EC-130	EC-130	EC-130	EC-130
Pyongyang	EC-130	EC-130	EC-130 + ERP, widebody	Widebody
Belgrade	EC-130	EC-130	EC-130 + ERP, widebody	Widebody
Baghdad	EC-130 night, widebody day	Widebody	Widebody + ERP, Global Hawk	Widebody + ERP, Global Hawk
Teheran	EC-130 night, widebody day	Widebody, Global Hawk	Global Hawk	Global Hawk

Table 5.4 Predicted performance of broadcast transmissions in selected operational scenarios

Table 5.4 illustrates the limitations of the EC-130 platform (whether the EC-130E or J variants), attributable primarily to its limited altitude. A widebody platform, flying at 40,000 ft and possibly with 3 to 6 dB additional ERP, would allow radio and TV broadcasts into many additional areas of interest. A Global Hawk UAV platform or a high-altitude unarmed platform flying at 60,000 ft could potentially stand off even further than a widebody; however, issues of payload capacity and flexibility call for careful consideration when comparing the two. At 60,000 ft there is only a 22 percent increase in horizon distance over a widebody (see table 5.1). On the other hand, loss of an unmanned Global Hawk to hostile action is considerably preferable to loss of a manned aircraft.

In the discussions above, a clear channel is assumed -- that is, there is no other radio or TV station transmitting on the frequency in question and there is no jamming. The first of these is a reasonable assumption because it can be safely assumed that several radio and TV channels will be free of existing transmitters even in a dense urban area. The VHF-L TV channels are most desirable for reasons listed in table 5.3, so these will often be occupied, as they are in U.S. urban areas. Next in desirability are the VHF-H channels, and finally the UHF channels, where degradation beyond line of sight is very rapid. Transmissions from *Commando Solo* into Belgrade were confined to UHF because of existing broadcasts into Belgrade and, very importantly, because of potential interference in neighboring countries. Performance deficiencies were clearly exacerbated by operation in UHF.

The question of jamming seems a very important one. If broadcast PSYOP are having a tangible effect on an opponent, then it seems reasonable that jamming will be present. The above discussion illustrates that broadcast quality is marginal in many cases,

especially against sophisticated adversaries including North Korea, Yugoslavia, Iraq, and Iran. Given the asymmetries of today's warfare, the placement of jammers on civilian centers would make them quite immune to attack. The very real possibility of broadcast jamming should, therefore, be included in any decision to significantly upgrade system performance.

Several options might be pursued in an effort to maintain the viability of U.S. broadcast PSYOP capabilities. One extreme is to keep the EC-130E fleet and install modest upgrades. This approach does not deny that there are serious inadequacies in the current platform's altitude capability and in the suite of onboard electronics, as demonstrated in Kosovo. However, it does recognize the rapid changes taking place in broadcast telecommunications and expects other broadcast modes to become available and popular in those portions of the world where *Commando Solo* would not perform adequately today, as discussed in chapter 4. Another approach that is currently being studied by DoD is to upgrade and cross-deck current *Commando Solo* equipment to EC-130J aircraft, which have slightly better flight performance and, most likely, lower maintenance costs. On the other end of the spectrum are approaches that would develop a new widebody or even high-altitude UAV (such as Global Hawk), complete with state-of-the-art transmitters and antennas capable of reaching perhaps 300 miles with TV and radio signals -- a large improvement over *Commando Solo* that would, at best, be marginal in Teheran. Such an approach might also require fewer aircraft due to longer endurance.

The Task Force has weighed all of these options and finds that the costs associated with cross-decking the current Commando Solo SME from the EC-130E to the EC-130J platforms (estimated to be about \$250 million) are excessive and would not result in substantively improved performance. Furthermore, the trends in future information transport discussed in chapter 4 indicate movement away from TV and radio broadcast in many parts of the world. For these reasons, the Task Force believes that these funds would be better spent for improvements in overall PSYOP capabilities, the utilization of modern media product creation and dissemination capabilities, and the development of modular TV and radio broadcast equipment to allow for their utilization on a variety of platforms.

CHAPTER 6

Recommendations

This DSB Task Force was originally created because of concern over the inability of the *Commando Solo* (EC-130E) aircraft to disseminate TV and radio broadcasts during the recent military operation in the Balkans. The Task Force chose to broaden its charter and address issues associated with PSYOP as part of an overall Information Operations (IO) campaign during peace, crisis, and armed hostilities. The Task Force also evaluated organizational issues associated with PSYOP forces within DoD and addressed issues associated with the PSYOP community's relationship to the Intelligence Community. Of particular interest is the on-going worldwide explosion of information creation and dissemination technologies and capabilities. The Task Force spent considerable effort addressing modern trends in information dissemination and media content creation. With those trends as a backdrop, the Task Force then assessed the viability of the current *Commando Solo* fleet and a variety of options currently being studied by DoD. The following recommendations were derived from all of these considerations.

Recommendation 1

The Task Force recommends that DoD create a PSYOP policy and planning staff, under the coordination authority of the Office of the Assistant Secretary of Defense for Special Operations and Low-Intensity Conflict (OASD(SO/LIC)), to ensure the integration of operational- and tactical-level PSYOP with strategic perception-management initiatives and to provide planning support for strategic PSYOP activities.

Recommendation 2

The Task Force recommends that rank structure and career paths within PSYOP forces should be reassessed and more specifically:

- *the senior PSYOP Advisor to the geographical CINCs should be an O-6 or equivalent civilian, and be assigned to the CINC Special Staff, and*
- *the Commander of the Joint PSYOP Task Force supporting the Joint Task Force Commander (typically a three-star flag officer) in theater should also be an O-6.*

Recommendation 3

The Task Force recommends that OASD(SO/LIC) and USSOCOM strive to improve overall product quality through increased reliance on commercial providers for high-quality products. Furthermore, the Task Force recommends that the PSYOP force be adequately resourced and trained to engage a stable of commercial media content providers who can deliver these quality products. The Task Force estimates this investment to be approximately \$10 million per year.

Recommendation 4

The Task Force recommends that the Defense Intelligence Agency be tasked by the ASD C3I to establish a psychological warfare intelligence element. ASD C3I should be charged to either (a) provide resources to the PSYOP community to implement a robust

organic program of open source acquisition, or (b) task the Intelligence Community to fulfill the need for on-the-shelf, worldwide basic information, including the media and cultural background information necessary to adequately inform PSYOP products in a given country. The Task Force believes that this can be accomplished without incurring an extra budgetary burden.

Recommendation 5

The Task Force recommends that ASD C3I make NFIP/JMIP funds available to USSOCOM for the express purpose of acquiring available data sets, particularly those for countries outside North America and Europe. The Task Force also recommends that CINCSOC work with the Foreign Military Studies Office (FMSO) to ensure the integration of these data sets with the World Basic Information Library (WBIL) and their community-wide accessibility. Moreover, the Intelligence Community should be further tasked through ASD C3I to develop methods and sources to obtain media use demographic information where it is not now available but where the United States might plausibly have future national security interests in which PSYOP might be employed. The Task Force estimates this investment to be approximately \$5 million per year.

Recommendation 6

The Task Force recommends that OSD work with the Department of State to fund, position, exercise, and maintain suitable distribution channels and brand identities, insofar as these can be reasonably anticipated for future PSYOP requirements. Policies with respect to the use of new and emerging transnational media should be developed and refined. Liberal reliance on recognized professionals and the generous use of highly qualified commercial entities are highly recommended. Buying good content on which the messages will "ride" is a necessary and desirable expenditure. The Task Force estimates this investment to be approximately \$10 million per year.

Recommendation 7

The Task Force recommends that DoD acquire the technical capability to understand emerging media dissemination techniques and technologies. Furthermore, DoD should provide the resources to acquire (rent or purchase) emerging media content and dissemination channels from commercial organizations. Here, DoD may be able to acquire good channels very cheaply by means of being an "anchor tenant." The Task Force estimates this investment to be approximately \$10 million per year.

Recommendation 8

The Task Force recommends that DoD maintain the current EC-130E Commando Solo fleet with existing Special Mission Equipment (SME). The estimated cost of \$250 million to cross-deck the SME to a EC-130J platform is not justified by the marginal increase in performance offered by this option. In addition, future worldwide media dissemination trends will limit the effectiveness of radio and TV broadcasts. The Task Force recommends that USSOCOM investigate the creation of small and easily reconfigurable information-dissemination packages, compatible with multiple platforms, including UAVs and leased aircraft, for a variety of missions. The Task Force estimates the initial

investment for design and development of these packages to be \$10 to \$20 million per year.

Recommendation 9

The Task Force has recommended annual funding increases (in recommendations 1 through 8) of approximately \$50 million per year. The Task Force believes that this increase would be readily supported by reprogramming the \$250 million that would be required to fund cross-decking of the existing Commando SME to the EC-130J platforms.

The prompt and effective use of PSYOP in military operations can avert crises, end wars, and save lives. The Department of Defense should prioritize Psychological Operations appropriately, because the misuse of PSYOP can cause untold damage to military operations. A relatively small investment over time can reap huge rewards for the United States and its allies, both diplomatically and militarily.

OFFICE OF THE SECRETARY OF DEFENSE
3140 DEFENSE PENTAGON
WASHINGTON, DC 20301-3140

27 October 1999

DEFENSE SCIENCE
BOARD

MEMORANDUM FOR CHAIRMAN, DEFENSE SCIENCE BOARD

SUBJECT: Terms of Reference--Defense Science Board Task Force on the Creation and Dissemination of all Forms of Information in Support of PSYOPS in Time of Military Conflict

You are requested to form a Defense Science Board (DSB) Task Force on all forms of information creation and dissemination in support of PSYOPS in times of military conflict. The Task Force is to support the Congressional directive for the Secretary of Defense to examine the creation and dissemination of all forms of information and the adequacy of the capabilities of the United States Armed Forces in this area to deal with situations such as the conflict in the Federal Republic of Yugoslavia.

In support of this Congressional direction, the Task Force should:

1. Assess the capabilities of the United States Armed Forces to develop programming and to broadcast factual information that can reach a large segment of the general public in a country like the Federal Republic of Yugoslavia;
2. Assess the potential of various airborne or land-based mechanisms to have the capabilities described above, including but not limited to desirable improvements to the EC-130 Commando Solo aircraft, and the utilization of other airborne platforms, unmanned aerial vehicles, and land-based transmitters in conjunction with satellites;
3. Assess other issues relating to the creation and dissemination of all forms of information in time of conflict, to include satellite broadcasts and the utilization of emerging mobile communication technologies;

The Task Force should provide a progress report by February 1, 2000 to the DoD so that the Secretary of Defense can provide his assessment and recommendations to the congressional defense committees by March 1, 2000.

The Task Force will be co-sponsored by the Under Secretary

of Defense for Acquisition, Technology and Logistics, and Assistant Secretary of Defense for Special Operations & Low-Intensity Conflict. Mr. Vince Vitto will serve as Chairman of the Task Force. COL Fred Gilbert will serve as Executive Secretary; and CDR Brian Hughes, USN will serve as the DSB Secretariat Representative.

The Task Force shall have access to classified information needed to develop its assessment and recommendations.

The Task Force will be operated in accordance with the provisions of P.L. 92-463, the "Federal Advisory Committee Act," and DoD Directive 5105.4, "The DoD Federal Advisory Committee Management Program." It is not anticipated that this Task Force will need to go into any "particular matters" within the meaning of Section 208 of Title 18, U.S. Code, nor will it cause any member to be placed in the position of acting as a procurement official.

CONGRESSIONAL LANGUAGE

Public Law 106-65

Title – National Defense Authorization Act for Fiscal Year 2000

Subtitle G — Other Matters

Sec. 1061 — Defense Science Board Task Force on Use of Television and Radio as a Propaganda Instrument in Time of Military Conflict

- (a) Establishment of Task Force—The Secretary of Defense shall establish a task force of the Defense Science Board to examine—
 - (1) the use of radio and television broadcasting as a propaganda instrument in time of military conflict; and
 - (2) the adequacy of the capabilities of the Armed Forces to make such uses of radio and television during conflicts such as the conflict in the Federal Republic of Yugoslavia in the spring of 1999.
- (b) Duties of Task Force: The task force shall assess and develop recommendations as to the appropriate capabilities, if any, that the Armed Forces should have to broadcast radio and television into a region in time of military conflict so as to ensure that the general public in that region is exposed to the facts of the conflict. In making that assessment and developing those recommendations, the task force shall review the following—
 - (1) The capabilities of the Armed Forces to develop programming and to make broadcasts that can reach a large segment of the general public in a country such as the Federal Republic of Yugoslavia.
 - (2) The potential of various Department of Defense airborne or land-based mechanisms to have capabilities described in paragraph (1), including improvements to the EC-130 *Commando Solo* aircraft and the use of other airborne platforms, unmanned aerial vehicles, and land-based transmitters in conjunction with satellites.
 - (3) Other issues relating to the use of television and radio as a propaganda instrument in time of conflict.
- (c) Report: The task force shall submit to the Secretary of Defense a report containing its assessments and recommendations under subsection (b) not later than February 1, 2000. The Secretary shall submit the report, together with the comments and recommendations of the Secretary to the congressional defense committees not later than March 1, 2000.

ABSTRACT

AUTHOR: Gary L. Whitley

TITLE: PSYOP Operations in the 21st Century

FORMAT: Strategy Research Project

DATE: 10 April 2000

PAGES: 37

CLASSIFICATION: Unclassified

A revolution in Psychological Operations (PSYOP) will occur in the near future. The Internet will be the vehicle to enable a revolution in PSYOP and improve the capabilities of PSYOP to achieve objectives specified in the National Security Strategy (NSS). The paper is structured to support this thesis by first providing a detailed definition and description of PSYOP. Next the importance of communication techniques in developing PSYOP methods is described. The understanding gained from these sections is then used to emphasize how the Internet can revolutionize PSYOP. Reflex control was presented as a method of PSYOP for the future. Then, based on the knowledge presented in this paper, some recommendations are made on how the Internet could be used to revolutionize future PSYOP campaigns. PSYOP has been an essential element of warfare since ancient times. PSYOP will continue to be a key strategic weapon to provide the ways to accomplish the objectives specified in the NSS. As Napoleon Bonaparte once said,

"There are but two powers in the world, the sword and the mind. In the long run the sword is always beaten by the mind."

PSYOP Operations in the 21st Century

A revolution in Psychological Operations (PSYOP) will occur in the near future. The Internet will be the vehicle to enable a revolution in PSYOP and improve the capabilities of PSYOP to achieve objectives specified in the National Security Strategy (NSS). The paper is structured to support this thesis.

First a detailed definition and description of PSYOP is provided. Next the importance of communication techniques in developing PSYOP methods is described. The understanding gained from these sections is essential to realize how the Internet can revolutionize PSYOP. Reflex control was presented as a method of PSYOP for the future. Then with the knowledge presented in this paper some recommendations are made on how the Internet could be used to revolutionize future PSYOP campaigns.

PSYOP has been an essential element of warfare since ancient times. Some of my favorite PSYOP quotes are contained below.

"To seduce the enemy's soldiers from their allegiance and encourage them to surrender is of special service, for an adversary is more hurt by desertion than by slaughter."

Flavius Vegetius Renatus, c. 378 AD

"One need not destroy one's enemy. One need only destroy his willingness to engage."

Sun Tzu

"There are but two powers in the world, the sword and the mind. In the long run the sword is always beaten by the mind."

Napolean Bonaparte

"It is your attitude, and the suspicion that you are maturing the boldest designs against him, that imposes on your enemy."

Frederick the Great, 1747

"As the excited passions of hostile people are of themselves a powerful enemy, both the general and his government should use their best efforts to allay them."

LTG Antoine-Henri Baron de Jomini, 1838

"The real target in war is the mind of the enemy command, not the bodies of his troops. If we operate against his troops it is fundamentally for the effect that action will produce on the mind and will of the commander; indeed, the trend of warfare and the development of new weapons – aircraft and tanks – promise to give us increased and more direct opportunities of striking at this psychological target."
Captain Sir Basil Liddell Hart, 1944

"On the fields of friendly strife are sown the seeds that on other days and other fields will bear the fruits of victory."
General Douglas MacArthur

"PSYOP...was a great threat to troop morale, second only to the coalition bombing campaign."
Iraqi General after Operation Desert Storm

"Killing the enemy's courage is as vital as killing his troops."
Carl Von Clausewitz¹

There are two purposes for this paper. One is personal and the other is to benefit the reader. On the personal side, the topic area of PSYOP was chosen to improve my knowledge in this area of warfare. To benefit the reader I have provided a detailed and descriptive definition of PSYOP. Also I have provided an explanation of a type of future PSYOP that can be effectively and efficiently employed as a way to achieve the ends as specified in the NSS.

Definition and Description of PSYOP

PSYOP have been employed for thousands of years. Since PSYOP have been conducted over an expansive period of time and across the spectrum of crisis and threats, it is essential that a definition be identified. There were many sources reviewed to derive a definition of PSYOP. The most complete and precise definition was found in Joint Publication 3-53. Accordingly, since this is our current doctrine, it will be used. The definition chosen and used throughout this paper was obtained from Joint Publication 3-53 Doctrine for Joint Psychological Operations:

Psychological operations are operations planned to convey selected information and indicators to foreign audiences to influence their emotions, motives, objective reasoning, and ultimately the behavior of foreign governments, organizations, groups, and individuals.²

It is also important to understand where PSYOP resides in our joint doctrine. In current joint doctrine, PSYOP is a subset of Information Operations (IO). Joint Publication 3-13 defines IO as actions taken to affect an adversary's information and information systems while defending one's own information and information system. Furthermore, PSYOP is identified as a capability in offensive IO. Joint Pub 3-13 defines Offensive IO as:

Offensive IO is the integrated use of assigned and supporting capabilities and activities, mutually supported by intelligence, to affect adversary decision-makers to achieve or promote specific objectives. These capabilities and activities include, but are not limited to, operations security, military deception, psychological operations, electronic warfare, physical attack and/or destruction, and special information operations, and could include computer network attack.³

Strategic PSYOP	International information activities conducted by United States Government agencies to influence foreign attitudes, perceptions, and behavior in favor or United States goals and objectives. These programs are conducted predominantly outside the military arena but can utilize Department of Defense assets and are supported by military PSYOP.
Operational PSYOP	Conducted prior to, during war or conflict, and at the conclusion of open hostilities in a defined geographic area to promote the effectiveness of the area commander's campaigns and strategies.
Tactical PSYOP	Conducted in the area assigned a tactical commander during conflict and war to support the tactical mission against opposing forces.
Consolidated PSYOP	Conducted in foreign areas that are inhabited by an enemy or potentially hostile populace and occupied by United States forces, or in which United States forces, or in which United States forces are based, to produce behaviors by the foreign populace that support United States objectives in the area.

Table 1 Categories of PSYOP⁴

Offensive IO is conducted at all level of war and therefore PSYOP are as well employed at each level. Additionally Joint Publication 3-53 defines the categories of military PSYOP as strategic, operational, tactical, and consolidated. These categories are defined in table 1 above.

Figure Colors of Propaganda/PSYOP⁵

The above Figure illustrates the types of PSYOP that can be conducted. This figure was obtained from a publication published in 1951. As you can see, the term used for PSYOP during this period of times was propaganda. The terms have changed since 1951 but the principles have remained the same. (For further information please refer to the glossary where definitions of several key terms in this paper are defined.)

You can swap the terms for basic definitions of black, gray, and white propaganda for PSYOP. Typically in the United States, the lead agency for conducting black and gray PSYOP is the Central Intelligence Agency. The military Services (the Army in particular) typically have a greater or equal role in conducting white PSYOP. Also it is important to note that the Department of Defense (DoD) does not conduct PSYOP within the United States or against our allies. This is confirmed through the definition of PSYOP as a subset of offensive IO. Therefore it is highly unlikely that the DoD or military Services would conduct offensive IO within the United States or against our allies.

It is also important to note that the utmost care must be taken in planning black or gray PSYOP. Sever damage can occur to credibility of public affairs (PA) and media channels if care is not taken in conducting black or gray PSYOP. Accordingly, white PSYOP should remain as such and not cross into gray or black PSYOP.

PSYOP Planning

The principles of developing PSYOP apply across the range of military operations. Although the complexity of the methodology varies with the target audiences, basic considerations for development of all PSYOP actions are the same. Actions essential to successful PSYOP are:

1. A clearly defined mission; analysis of all targets;
2. Actions that are evaluated for psychological implications;
3. A reliable medium or media for transmission;
4. Rapid exploitation of PSYOP themes; and
5. Continual evaluation of the results of PSYOP for relevance to the mission and goals.⁶

There are four general points to consider with regards to PSYOP. These are contained below.

1. Origination, including both human and mechanical sources,
2. Transmission, including both human and mechanical transmission whether, for example by means of staff commands or by means of electronic impulses.
3. Reception, both in terms of the physio—psychological impact of an actual physical effect on a human nervous system and in terms of the emotional or idea effect produced in the personalities, which are the recipients of the physical transmission.
4. Evaluation, whether by the originating the transmitting, or the receiving-personalities or authorities.⁷

PSYOP techniques are used to plan and execute truth projection activities intended to inform foreign groups and populations persuasively. PA provide objective reporting, without intent to propagandize. As open sources to foreign countries and the United States, PA channels can be used to disseminate international information. To maintain the credibility of military PA, steps must be taken to protect against slanting or manipulating such PA channels. PSYOP messages must be coordinated with counterintelligence planners and operators,

with military deception planners, and with operations security planners to ensure that essential secrecy is realized, counterintelligence operations are not compromised, and messages reinforce the desired appreciation of counterintelligence and deception as well as PSYOP plans.⁸

Planned military PSYOP may affect not only military targets but also political, economic, or social structures within the target area. The general objectives of joint PSYOP are:

1. To reduce efficiency of opposing forces;
2. Further the US and/or multinational war effort by modifying or manipulating attitudes and behavior of selected audiences;
3. Facilitate reorganization and control of occupied or liberated areas in conjunction with civil-military operations;
4. Obtain the cooperation of allies or coalition partners and neutrals in any PSYOP effort; and
5. Support and enhance humanitarian assistance, foreign internal defense, and/or foreign nation assistance military operations.⁹

A thorough knowledge of national and theater military security policies and objectives, joint operations planning skills and a thorough understanding of the customs, mores, and values of the target audience are required for PSYOP success. The development of the PSYOP plan requires research and analysis, development of a way to convey or deny information, production requirements, and dissemination plans.¹⁰

These sources of information should be accessible to or be activities observable by target groups. When appropriate, deception means can be used to convey messages to foreign groups having access to foreign intelligence. Planners must understand both the possibilities and limitations of each means and the factors to consider in their use. Planners should understand the difference between planning for joint operations and planning for overt peacetime PSYOP programs. Peacetime programs are planned in consonance with the respective US Ambassador's country plan and support national objectives and policy. Plans for military operations other than war (MOOTW) and war also support national objectives and policy but generally have a different focus for PSYOP than peacetime programs.¹¹

PSYOP and the Range of Military Operations

The role of PSYOP varies depending on the level of operational activity or environment. Typical MOOTW that can be supported by joint PSYOP include humanitarian assistance and disaster relief, nation assistance, security assistance, FID, counterdrug operations, and peace support operations. MOOTW not involving the use or threat of force activities provide training and in-theater access to allow for the facilitation and use of PSYOP during the transition to war. MOOTW involving the use or threat of force require the application of the diplomatic, military, economic, and informational instruments of national power. Nonlethal activities, such as PSYOP, can be decisive in MOOTW involving the use or threat of force. During war, PSYOP at the strategic, operational, and tactical level may enhance the success of operations at all echelons. Employment of PSYOP can be equally effective in supporting both offensive and defensive operations conducted by conventional forces. Special operations are also an integral part of modern warfare, which may support conventional military operations, or they may be conducted alone. Unconventional warfare, foreign internal defense, direct action, special reconnaissance, counterterrorism, and civil affairs are some of the special operations that may support PSYOP.¹²

Support for PSYOP

Intelligence; counterintelligence; Command, Control, Communications, and Computers systems (C⁴); and logistics support military PSYOP and are invaluable for the success of such actions.¹³ PSYOP planners must possess a thorough and current knowledge of these conditions to develop PSYOP targeted at selected foreign groups to influence the objective and emotional reasoning. Intelligence Support: This knowledge is obtained through the use of the intelligence cycle which is the process by which intelligence is obtained, produced, and made available to the PSYOP planner. The intelligence cycle has five steps: planning and direction, collection, processing, production, and dissemination. C4 Systems Support: Communication between staffs and commands that are planning and executing PSYOP actions are necessary for effective joint use of capabilities. A joint PSYOP communications plan should be prepared to ensure that communications systems are compatible and adequate. Logistic Support: PSYOP forces will normally deploy with a 30-day basic load of PSYOP supplies. This is a baseline planning figure and may not be sufficient to meet specific contingency mission requirements. Joint planners must ensure that PSYOP support requirements are taken into account when planning logistic support.¹⁴

PSYOP Wrap-Up

PSYOP are used to convey selected information and indicators to foreign audiences to influence their emotions, objective reasoning, and motives. In order to accomplish this goal, PSYOP must be directed at a clearly defined goal or objective, the ability to analyze and evaluate targets and their effects, a reliable media transmission, and a rapid ability to implement PSYOP. PSYOP depends on communication to ensure proper execution of the mission and objectives. Command and control, preplanning and support from all levels ensure this.¹⁵

PSYOP and the NSS

The above paragraphs provided a description and definition of PSYOP. From this information one can see that PSYOP is a way to achieve our objectives as identified in the NSS. PSYOP are a vital part of the broad range of US political, military, economic, and informational activities to achieve the ends of the National Security Strategy. When properly employed, PSYOP can lower the morale and reduce the efficiency of enemy forces and could create dissidence and disaffection within their ranks. There are several pertinent references in the 1999 NSS that PSYOP could be used as a way to advance the United States' national interests. These are found in the sections using military activities to shape the international environment.

The U.S. military plays a crucial role in shaping the international security environment in ways that protect and promote U.S. interests. Through overseas presence and peacetime engagement activities such as defense cooperation, security assistance, and training and exercises with allies and friends, our Armed Forces help to deter aggression and coercion, build coalitions, promote regional stability and serve as role models for militaries in emerging democracies.¹⁶

Our ability to deter potential adversaries in peacetime rests on several factors, particularly on our demonstrated will and ability to uphold our security commitments when they are challenged. We have earned this reputation through both our declared policy, which clearly communicates costs to potential adversaries, and our credible warfighting capability.¹⁷

We also are committed to maintaining information superiority - the capability to collect, process, and disseminate an uninterrupted flow of information while exploiting and/or denying an adversary's ability to do the same. We must keep pace with rapidly evolving information technology so that we can cultivate and harvest the promise of information superiority among U.S. forces and coalition partners while exploiting the shortfalls in our adversaries' information capabilities.¹⁸

Efforts to deter an adversary - be it an aggressor nation, terrorist group or criminal organization - can become the leading edge of crisis response. In this sense, deterrence straddles the line between shaping the international environment and responding to crises. Deterrence in crisis generally involves signaling the United States' commitment to a particular country or interest by enhancing our warfighting capability in the theater. We may also choose to make additional statements to communicate the costs of aggression or coercion to an adversary, and in some cases may choose to employ U.S. forces to underline the message and deter further adventurism.¹⁹

In each of these references, PSYOP can be employed to achieve the identified ends (to control the thinking and behavior of a group or individual). The need to integrate PSYOP with all national elements of power has been a precept for decades. A 1941 source on German Psychological Warfare in the 1930's states this as,

"Propaganda is not used for the sake of propaganda. It is used in conjunction with a military, diplomatic or economic objective [must now include informational]. It obtains its best results in neutral countries, or before the actual outbreak of war, or in stirring up disunity in non-belligerent nations. Nazi propaganda must win its major victories before the "shooting war" begins. In wartime it is chiefly an auxiliary weapon. It cannot win wars, nor can it prevent defeat, but its psychological techniques, if applied persistently and timed accurately, can be a deciding factor in battles, particularly in Total War."²⁰

Reflex Control and Human Network Attacks

The primary goal of PSYOP is to control the thinking and behavior of the target audience. To accomplish this you must act to manipulate the information the target audience receives. Typically the term given to the controller for information is a data processor. For an individual, the data processor is the brain. This is a vulnerable target since the brain has no firewall or virus protection to protect it from either deceptive or electromagnetic processes. As a result, the mind of the soldier on the battlefield, terrorist, or strategic leader is potentially the most exploitable and unprotected PSYOP target. These targets are vulnerable to human network attacks (HNA).

Russia has some interesting information-psychological operations developments in the area of human behavior control mechanisms termed *reflexive control*. Reflexive control is a type of HNA. The target of a HNA is the enemy's decision making processes, both human (the mind's soft data processor) and material (hardware data processing).

Technological developments make it possible to subject all people, from ordinary citizens to strategic leaders, heads of state, or military leaders, to a complex PSYOP offensive. Simulated and reproduced voices, fabricated provocative speeches delivered by virtual heads of state, and projected images of actual life situations can affect mind and achieve behavior control. This special information media, such as language, texts, images and sound, as future enemy weapons capable of exerting a "multilevel operational effect instead of simply a political or economic one. The target is the enemy's decision-making process, both human and material. The main task is to overwhelm opposing forces through the use of terror tactics, thereby upsetting their psychological stability. PSYOP start in peacetime and, if war erupts, run the spectrum of crisis."²¹

A further description of reflexive control is important here. Reflexive control involves creating a pattern or providing partial information that causes an enemy to react in a predetermined fashion without realizing that he is being manipulated. Its aim above all else is to influence command and control systems and decision-makers. The same type equipment used in a typical PSYOP will support reflexive control operations. In these operations the "information or facts" can now be fabricated in a much more realistic form in real time on radio or TV using a high-tech voice and image recording and editing equipment. Perhaps even more important, the means of psychological warfare are now more diversified, and its striking force has increased."²²

However, it is important to note that to conduct reflexive control operations we must employ black as well as gray PSYOP. Therefore these operations should be conducted with care to avoid loss of credibility with communication methods essential for conducting white PSYOP.

In Timothy L. Thomas's article, titled Human Network Attacks, he provides an excellent description of methods that could be used in a reflex control operation.

"Today, simulation, stealth and various types of camouflage technologies allow for the "mixing of the spurious with the genuine" and can cause errors in the enemy's decision-making. More important is acoustic technology because it creates deafening noises, such as explosions, whizzing sounds, rumblings and heartrending screams, to upset psychological stability. [Reflex control operations] will attempt to penetrate the mind of soldiers or key decision-makers to throw them into a psychological maze or cause psychological disorders or panic."²³

On the effectiveness of reflex control operations, he states:

"[Reflex control operations, as an] information weapon is more important than firepower in achieving objectives. His understanding is likely based on the belief that the use of the information weapons during the Cold War, such as the Strategic Defense Initiative or SDI, did more to defeat the Soviet Union and bring about its financial exhaustion and demise than any real weapons' use. [Reflex control] is also listed as a method for achieving geopolitical superiority and as a mechanism to control negotiations. In this regard reflex control would be used to influence a state's information element of power and thereby its decision-making process by formulating certain information or misinformation."²⁴

The following table contains the eleven types of mechanisms for use against systems, people, or groups in the field.

Distraction	During preparatory stages of combat operations, creating a real or imaginary threat against one of the most vital enemy places such as flanks and rear, forcing him to reevaluate his decisions to operate on this or that axis.
Overload	Often manifested by sending the enemy a large amount of conflicting information.
Paralysis	Creating the belief of a specific threat to a vital interest or weak spot.
Exhaustion	Cause the enemy to carry out useless operations, thereby entering combat with depleted resources.
Deception	During preparatory stages of combat operations force the enemy to reallocate forces to a threatened spot.
Divisive technique	Cause the enemy to believe he must operate in opposition to coalition interests.
Pacification	Through a peaceful attitude and approach cause the enemy to lose vigilance.
Deterrence	Create the impression of superiority.
Provocation	Force enemy action advantageous to your side.
Suggestion	offer information that affects the enemy legally, morally, ideologically or in, other areas.
Pressure	offer information that encourages society to discredit its own government.

Table 2 Eleven Types of Mechanisms²⁵

On the outer limits of reflex control, the Russian armed forces are studying a host of unusual subjects, almost all of which center on how information or electronic waves affect the mind. For example, a recent book offered an extensive set of algorithms designed to implant "suggestive influences" or what the author called "psycho viruses" into a person's mind.²⁶

PSYOP and Communication

PSYOP is communication. To employ successful PSYOP it is essential to use effective communication techniques to convey the message to the target audience. The function of PSYOP is to use communication to influence behavior. Therefore, a basic understanding of the nature of communication, the role of communication in a social environment, and the process of how people communicate with each other is necessary. Therefore we must define and analyze the principles of communication.²⁷

Definition of Communication

Communication includes the numerous processes by which one person influences another. This includes many human actions that include speech, written material, music, drama, Internet web sites, pictorial arts, and other forms of behavior.²⁸

Man as a social being develops various habit patterns that permit him to respond to particular gestures, verbal as well as non-verbal, and using this history of objects and events, he creates his particular world of reality. A person's understanding of a particular habit pattern is the set of responses that the individual generates as a result of the stimulus. The participation of the individual in the language process gives him the ability to communicate with himself (think) and with his social group. The entire process is structured around the social group. Human communication is the basis for group norms; it is the means by which social control is exerted, roles are allocated, coordination of effort is achieved, expectations are made manifest, and the social process is carried on. Communication should also be considered as the sharing of information. Each individual or social group considers information or ideas based on his needs, comprehending and using the information in a manner that best suits his particular interests.²⁹

To understand communications, you must understand people. To understand human communication it requires the ability to understand and relate the content of communication messages to the desires of people, groups, organizations, and societies. The ability to understand how people relate to each other is crucial.³⁰

Individuals living in society generally desire to adhere to the opinions, attitudes, and habits of those with whom they are motivated to interact. They form a culture. The culture influences individuals as well as influences each other's perceptions, and the individual's way of seeing reality is based on the *actual world* around him. All social groups have a culture and require

a degree of conformity. The group culture provides definitive methods and procedures to insure conformity to group norms and values.³¹

A final but significant point is that groups, like individuals have goals. And these goals often cannot be achieved without a degree of consensus. It is obvious that if a majority of the individuals cannot agree on the proper course of action, they cannot act collectively. It is only through meaningful communication that collective action and consensus can be attained.³²

The Role of Communication

Communication can be considered as the great relating tool. It relates individuals to each other and to historical perspective as well as to the culture of the group. This makes group functioning possible and allows societies to live in harmony.³³

With the understanding that an important function of communication is relating people to each other or to groups, or to history, the content of a message is significant. We can group the majority of social communication under four major functions from the originator as well as the receiver's point of view.

Originator	Receiver
To inform	To understand
To instruct or teach	To learn
To entertain	To enjoy
To persuade	To dispose or decide

Table 3 Social Communication Major Functions³⁴

It is important that PSYOP warriors understand that communication content of the PSYOP messages can be designed to perform all of the functions stated above, any one of the four, or any mix.

Often the role of communication found in United States policy is considered along rigid lines. Frequently the role of PSYOP is viewed as a loudspeaker and leaflet operation addressing only the persuasive function. A PSYOP organization that directs its efforts to only one function communication is at a distinct disadvantage competing with communication viewed as a political weapon and directed at the whole person, skillfully combining the four functions of communication.³⁵

The Communication Process

For maximum effect, propaganda demands:

1. A specific rather than a general theme;
2. Some trust of our motives on the part of the audience;
3. Timing such that the propaganda campaign can immediately precede the actions its intended to affect;
4. First class intelligence in three phases:
 - a. Social and cultural attributes of the people concerned;
 - b. Extent to which the people listen to or read our propaganda;
 - c. Extent to which it affects their actions; and
5. Accessibility, i.e., the audience must be able to hear our broadcasts or read our pamphlets.³⁶

All human communication must take place in the framework of social relations. The importance of understanding interpersonal relationships as an essential part of the communication process and the need for a clear vision of social pressures as part of the total communication process needs to be emphasized.³⁷

There are many variables to consider in order to identify effective communication.

Some of these are:

organizational membership; the audience's image of the sources; the time period; the group orientation of the audience member and the degree to which he values group membership; the activity of opinion leaders; the social aspects of the situation during and after exposure to the media, and the degree to which the audience member is forced to play a role; the personality pattern of the audience member, his social class, and the level of his frustrations; the nature of the media in a free enterprise system; and the availability of social mechanisms for implementing action drives.³⁸

Communication Climate

The communication climate is one of the social factors that affect persuasive communication. That is, what people say and how they react to a PSYOP message depends on where they are, who is listening, and what communication channel is being used. The

communication climate can be classified the private communication or public communication.³⁹

There are two types of private communication to consider: Face to face and interposed. Face-to-face conversation is one type of private communication: *Interposed* (private communications such as a letter, a telephone call, an electronic mail message, fax, etc.) constitutes the other.⁴⁰

Mass media or public communication channels can be face-to-face and public (mass meetings, cultural drama performances, movies, or operas) or private (the individual as a radio or television viewer, or reading a magazine, book, web site, or leaflet). The significant point is that the communication situation determines to some extent the kind of communication that goes on and the response that is likely to be made to it.⁴¹

For example, many techniques used to stimulate enthusiasm at a public rally would not be appropriately used in an individual, private environment. It is unlikely that a person listening to a radio in private would develop crowd excitement and its consequent behavior. Additionally, a person would not communicate with a stranger in the same manner as with a member of his immediate family group, nor would he communicate with a trusted friend in the same manner as with a government official.⁴²

A variety of communication techniques can be used to combine private and public communication. For example, a duplicate of a public poster can be prepared as a small handout or leaflet, or enhance on a web site, thus permitting the individual to discuss the poster in public and at the same time carry the message home to discuss it with members of his family.⁴³

The leaflet reinforces the government message and gives additional meaning to the public poster and the web site can provide branch to additional information or direct the individual where they can gain additional information. Also, the handout or leaflet tends to set in motion a functional communication group to discuss the poster for the second time (after the PSYOP cadre departs) in public.⁴⁴

Influence of the Group

The focus of this section is on the primary groups to which an individual belongs. These groups are the individual's family, friends, informal work teams, small military units, and the more formal groups. Within these groups the members are attracted to each other as personalities. These groups are characterized by their size, relative durability, informality, and face-to-face contact.⁴⁵

The response of the individual to communication cannot be accounted for without reference to his social environment and to the character of his interpersonal relationships. Four variables in the communication processes to consider in influencing the group are:

1. Exposure to the media;
2. Strengths and weakness of the different types of media;
3. Existing attitude or attitudes of the individuals;
4. The content of the message; and
5. The response of the individual to communication.⁴⁶

The influence of the group on communication is extremely important to PSYOP. PSYOP programs must be designed to communicate directly to the individual not as an isolated entity of society but rather that the individual is an integral part of an active social environment. This being the case, PSYOP intelligence and information gathering programs should not organize the collection of data as if each member of the target audience is isolated and in a sterile environment but as a member of a group. Man's attachments to these groups are significant; consequently, the opinions and activities shared with a group influence his response to all communication. In other words, interpersonal relationships must be considered to properly understand the communication process and to conduct effective PSYOP. Interpersonal relationships seem to be anchor points for individual opinions, attitudes, habits, and values.

This concept (the importance of the influence of the group) suggests that when people are interacting in the communication process, they generate and maintain common ideas and behavior patterns that they are reluctant to modify. Also, it is apparent that when communication concerns sensitive roles and standards of the group or group culture, it is usually checked with other members of the group.⁴⁷

PSYOP and the Internet

The use of the Internet jump-started the information age that began in the late 1990's. The use of the Internet is revolutionizing our lives. New improvements of higher access speeds and larger bandwidths will make the first decade of the millennium on this planet an amazing place. The Internet can be a tool to revolutionize PSYOP. There are four areas in which the Internet can be used to revolutionize PSYOP. These are to establish a PSYNET, coordination, implementation, and analysis of efficiency and effectiveness of a PSYOP campaign.

PSYNET would be a network similar to the SIPRNET or SCINET. This network would provide the means for PSYOP warriors to communicate and obtain information. The PSYNET is essential to accomplish the second area: coordination.

Coordination would be accomplished by establishing a PSYOP database. This database would contain items such as PSYOP lessons learned, current PSYOP campaign objectives, effective methods, etc. Also the PSYNET could be used to allow PSYOP warriors to exchange ideas as well as further develop this profession.

Implementation refers to methods to accomplish the PSYOP campaign. Reflex control is one of these implementation methods. As explained above, reflex control could entail developing simulated and reproduced voices, fabricated provocative speeches delivered by virtual heads of state, and projected images of actual life situations can affect mind and achieve behavior control. The PSYNET would be the way this message would reach the PSYOP target.

The PSYNET could easily be utilized to analyze the efficiency and effectiveness of a PSYOP campaign. A simple example of this is by monitoring a web site you have created to accomplish your PSYOP objectives. You can easily monitor who visits the web site and therefore determine what percentage of PSYOP target is accessing the web site. Through information data such as emails and voice communications you can gather hard data on the effectiveness of your PSYOP campaign.

The *bad guys* of the world are using the Internet to organize and share lessons learned. The United States must implement the PSYNET to level the playing field.

Conclusion

A revolution in PSYOP will occur in the near future. Improvements in hardware and software will allow for higher access speeds and larger bandwidths which will provide the means to overcome current Internet limitations. With these pending improvements realized, the Internet will be the vehicle to enable a revolution in PSYOP and improve the capabilities of PSYOP to achieve objectives specified in the NSS.

PSYOP has been an essential element of warfare since ancient times. PSYOP will continue to be a key strategic weapon to provide the ways to accomplish the objectives specified in the NSS. The Internet will be the tool to revolutionize PSYOP and make the first decade of the millennium on this planet an amazing place.

WORD COUNT = 5831

Glossary

The following provides some definitions of key terms in this paper.

Black propaganda - Propaganda that purports to emanate from a source other than the true one.

Grey propaganda - Propaganda that does not specifically identify any source.

Propaganda - Any form of communication in support of national objectives designed to influence the opinions, emotions, attitudes, or behavior of any group in order to benefit the sponsor, either directly or indirectly.

Psychological operations - Planned operations to convey selected information and indicators to foreign audiences to influence their emotions, motives, objective reasoning, and ultimately the behavior of foreign governments, organizations, groups, and individuals. The purpose of psychological operations is to induce or reinforce foreign attitudes and behavior favorable to the originator's objectives.

Psychological warfare - The planned use of propaganda and other psychological actions having the primary purpose of influencing the opinions, emotions, attitudes, and behavior of hostile foreign groups in such a way as to support the achievement of national objectives.

White propaganda - Propaganda disseminated and acknowledged by the sponsor or by an accredited agency thereof.

DISCLAIMER

This report, "The Art and Science of Psychological Operations: Case Studies of Military Application," was prepared by the American Institutes for Research (AIR) under Department of the Army contracts in response to a request from the Office of the Deputy Chief of Staff for Military Operations, Department of the Army.

Unless otherwise stated, views or conclusions contained in this report are those of AIR, the editors, or individual authors and are not necessarily those of the Department of the Army, the Department of Defense, or any other department or agency of the U.S. Government. Furthermore, the U.S. Government does not necessarily endorse or concur with the statements made or the conclusions drawn by any of the authors or contributors to this casebook.

It should also be noted that many of the original source publications carry specific disclaimers on their mastheads. Therefore, no implication should be drawn concerning the original source publishers' views regarding any article published by them, without consulting the original source publication.

Comments and questions on this report are invited and should be addressed to AIR.

FOREWORD

This collection of essays has been compiled by AIR using information in the open literature, unclassified government documents, and original contributions. In scope it covers the entire spectrum of military psychological operations (PSYOP). Appropriate consideration is given to related civilian activities as well as to relevant aspects of communication theory. Emphasis is placed on the entire operational field encompassed by such terms as "international communications," "political warfare," "cultural affairs," "psychological operations" (PSYOP), and "psychological warfare."

The editors have sought to illustrate the effective and noneffective uses of PSYOP and to describe the problems encountered and the solutions adopted by military and civilian personnel involved in PSYOP/Information activities during recent decades. Contrasting points of view were deliberately included in the casebook to provide a balanced as well as a general view of the state of the art. Some of the contributions may be considered controversial, depending on the reader's point of view. Where copyrighted material has been quoted, permission has been obtained for its use.

Comments, corrections, additions, and suggestions for factual, interpretative, or other changes will be welcomed. They may be addressed to:

American Institutes for Research

PREFACE

AIR, operating under a contract with the Department of the Army, has developed this two-volume anthology in the form of a PSYOP casebook. It has been prepared in response to a request from the Office of the Deputy Chief of Staff for Military Operations, Department of the Army.

PURPOSE AND SCOPE

This publication has been produced as a part of the overall research program undertaken by the Department of the Army to improve the capability of the United States Army to conduct PSYOP/information programs under a variety of circumstances in many different environments. The major focus of attention has been placed on psychological operations of military relevance, with special emphasis on the types of activities that may confront U.S. personnel in the two decades ahead.

In content, the editors have sought to cover the whole range of U.S. public international communications whether they be described as international information, cultural affairs, or psychological operations, and whether or not they be conducted by members of a military service or personnel of a civilian agency. The editors also have touched upon the ways in which PSYOP is employed elsewhere, with the hope that such material will serve to broaden the American understanding of how others around the world attempt to communicate effectively across cultural barriers and international borders.

COMMUNICATION THEORY AND PSYOP

The science of communication theory is relatively new; more than half of all research, most of the important books and articles in the field, and most of the great figures in the study of communications have become well known only in the last twenty years. Moreover, increasingly for the last decade and a half it is in the context of communication theory that psychological operations—PSYOP—has been studied. Therefore these volumes will include several timely essays on communication theory.

ORGANIZATION

The Art and Science of Psychological Operations is an anthology bringing together both original and previously published material. In effect, the essays comprise an analysis of the state of the PSYOP art. Some of them also provide conclusions and recommendations for the future. The individual essays, which are organized into chapters, deal with the nature and scope of PSYOP and communications; national policy and PSYOP; organizational and personnel matters; policy objectives and operational goals in Volume One; PSYOP intelligence requirements, sources, and methods; social science research (including communication theory) and PSYOP; media, methods, and techniques; evaluation of effectiveness; and foreign ideology and propaganda in Volume Two.

SOURCES

The types of selections that have been incorporated in this casebook

include professional and scholarly publications, original contributions, foreign and domestic PSYOP-related material, excerpts from official memoranda and directives, lecture notes, letters, and newspaper items. An attempt has been made to ensure a reasonable geographic coverage by providing examples from all areas of the world. For example, Algeria, Burma, Cameroon, New Zealand, Nigeria, Portuguese Guinea, Taiwan, and Rumania are among the more than 30 countries treated in the text.

METHODOLOGICAL NOTES

General

The casebook is designed to serve primarily as background information for training in the field of psychological operations and as an introduction to the more important elements and principles of PSYOP. It is intended to serve not only as a point of departure for the uninitiated but also as a useful reference. The use of overly sophisticated material requiring a substantial social science background has been avoided. On the other hand, articles dealing in overly simplistic terms with principles painfully obvious to the reader have been excluded.

The editors have, however, intentionally included several somewhat advanced papers in the section on research in Chapter VII and on PSYOP effectiveness in Chapter IX. In Chapter VII, the selections give an indication of how sophisticated social science research can contribute to PSYOP. Similarly, the content of Chapter IX would have been incomplete and anachronistic without reference to the methodological thinking current in the 1960s and early 1970s. It is believed that all the articles lend themselves to an understanding of the subject without an extensive background in communications research.

Secondly, most of the case studies have been purposefully selected to complement and supplement a standard reference in the field titled, *A Psychological Warfare Casebook*, written in 1956 by William E. Daugherty and Morris Janowitz. Changing perspectives of the nature and scope of PSYOP since that time, as well as changes in the politico-military environment in which PSYOP is carried out, have played an important part in the updating process. In this respect, the editors have given due weight to relevant events occurring since the publication of the PSYWAR casebook and have tried also to portray the new conceptions, methodologies, and techniques that have been developed to improve the effectiveness of PSYOP.

Thus, this compilation of case studies represents PSYOP generally in the 1960s, the situations experienced and the lessons learned in that decade. It is noted that although most of the incidents described took place between 1960 and 1972, some of them happened earlier but are best analyzed in the literature of the 1960s.

Philosophically, the editors of this casebook have tried to indicate the new concerns in PSYOP, the changing conceptions of the field as a whole, and the trends in the use of new methodologies and techniques to improve

its effectiveness. It is with reference to the change in conceptualization of PSYOP over the last fifteen years and to the trend of thinking in the early seventies that PSYOP is viewed in this book as communication. When the question is asked, "What is PSYOP?", the answers of different generations and different experts vary. Yet, as noted earlier, increasingly over the last decade and a half, psychological operations is studied in the context of communication. Although "persuasive" and "purposive" communications are the focus of this study, many scholars in the communications field argue that all communication is "purposive" and hence "persuasive." There is no need, in the context of present purposes, for this anthology to align itself with one or the other of these schools of thought.

Editorial Method

The desire to cover the "open" literature as thoroughly as possible and to make this an essential source book for both military and civilian personnel interested in PSYOP and communications has made it necessary to be as concise as possible. It has therefore been necessary to excerpt many selections on the basis of relevance and concision. Except in the very few cases where the essays were "adapted," the excerpting is indicated by the use of ellipsis points in both copyrighted and non-copyrighted material. Only in the "original" and editors' essays were editorial changes, other than purely stylistic ones, made. Where necessary, the footnotes in each essay were renumbered, but not otherwise altered in form. The notes pertinent to a particular essay appear at the conclusion of that essay. Bibliographic citations for most sources used by the essay authors are found at the end of each chapter.

In as far as possible, the editors sought the consent of authors and organizations, even when their material was not copyrighted. The copyright holder, at least, was provided with a copy of the material in its proposed form. A particular note is made of the willingness with which publishers, editors, and authors responded to requests for permission to reprint material. In some cases, they even offered to update, substitute, or revise their articles, and when time permitted, the editors were able to take advantage of this. Some authors even suggested that they were flattered to be included. The undersigned, however, look at this the other way around: this book needed their contributions.

Inevitably in a work such as this—in which authors represent many nationalities, professions, and perspectives—the reader will find some material in spoken or translated English. For example, in those contributions illustrative of the day-to-day output of military units engaged in actual operations, a kind of clipped but useful military style is employed. Such a style was retained because it has a feel of immediacy and serves as an example of real PSYOP in action.

As in any anthology, one is advised to consider the article's original date of publication in one's reading. A further result of the use of the case study approach is the fact that articles do not have an inherent order and

flow. Although each selection has been placed in a chapter on the basis of its contributions to the topic covered in that chapter, an overly rigid linking of the several selections would be an arbitrary enterprise, misleading in some cases, since many contributions are illustrative rather than conclusive. The editors, therefore, have used the introductory comments at the head of each article to place the contribution in its situational context in many cases. However, this means, in some instances, that emphasis has been placed on aspects the contributing author did not necessarily consider to be preeminent, given his sometimes different purpose. Furthermore, because of the disclaimers carried in the mastheads of many of the original source publications, no implication should be drawn concerning the original source publishers' views on any articles published by them, without consulting the original source.

The chapters of this anthology, as well as the articles themselves, stand alone in large measure, even though references and cross-references reflect the interdependence of the various aspects of the PSYOP process as a whole. It is to be noted that because of the use of the casebook approach, style varies markedly from one article to another, providing a diversion from a single manner of expression.

Finally, a concerted effort has been made in the selection process for this compilation to stress the importance that the "PSYOP-related" fields have for effective psychological operations. Moreover, admittedly, controversial analyses, conclusions, and recommendations are found in several of the articles. These have been included not only for the purposes of the casebook already discussed, but to stimulate thinking. Essays featuring contrasting points of view are presented to provide a general idea of the range of thought of the individuals working in the field.

At any rate, this study looks at psychological operations analytically and conceptually as well as descriptively. Above all, every action and all inaction communicate. The goal in PSYOP must be to ensure that, through the combination of action and words, the desired message is the one that is transmitted. This is as true for nations as it is for individuals and groups.

THE ART AND SCIENCE OF PSYCHOLOGICAL OPERATIONS
CASE STUDIES OF MILITARY APPLICATION

CHAPTER I. INTRODUCTION

PSYCHOLOGICAL OPERATIONS IN THE 1970s: A PROGRAM IN SEARCH OF A DOCTRINE*

BY ROBERT F. DELANEY

An overview of U.S. PSYOP in the past and its implications for the future.

I. BACKGROUND

Projection of American military strategy into the 1970s must be done with careful attention to the total national experience of the postwar era, which is seen by qualified observers as coming to an end. Not only does the United States face a considerably different geo-political situation in the 1970s, but for the first time in thirty years, the American economic resource base is admittedly limited, thus exercising a restraining influence on continued sizeable economic and military assistance programs abroad and defense fiscal year budgets at home. Extension of military thinking into the decade ahead, however, involves considerably more than analyses of the shifting balance of great power relationships as measured against the ever present risk of nuclear warfare.

The entire sweep of American military experience since 1945 is now subject to review. Indeed, in the opinion of such scholars and observers as Samuel Huntington, Thomas Schelling, Morton Halperin, Adam Yarmolinsky and Lyman Kirkpatrick, the United States will have missed a greatly needed opportunity to prepare its national future in a sane, responsible manner if a review is not made. Yet, such a review will most likely be painful, for the parochial and bureaucratic interests of the foreign affairs community and the military establishment will be subject to scrutiny, at times unfavorably. Nonetheless, the need for a sweeping review is quite evident. It would seem that an American style Esher War Committee, paralleling its famous early 1900 British counterpart, should address the doctrinal, organizational, and operational makeup of the American strategic posture and its military force structure. The times call for nothing less.

This paper attempts to address one small segment of such an overall perspective: psychological warfare doctrine and psychological operations past and future. It should be clearly understood that a critical analysis of future American psywar doctrine and its implementation cannot be precise. Psychological operations are not yet fundamentally quantifiable.¹ Beyond the field of public opinion research, social science has not yet developed reliable, accurate measuring techniques with direct applicability to field psychological operations.

But, it is the writer's view that psychological operations suffer less from impreciseness and lack of measurement of effectiveness than from a

*Adapted from a paper presented at the Inter-University Seminar on the Armed Forces, Chicago, Ill., November 1971. Reprinted with the permission of the author.

basic lack of definition, acceptance, and understanding. As a result, its very position within the national security structure is questionable and, in consequence, the organizational influence and the role of psychological operations have never received their proper due. There is ample historical reason for this position: in general, and despite notable but singular American achievements in the field, especially during World War II and at the outset of the "Cold War," American psychological doctrine and its implementation, both civil and military, have been deficient.

II. EVOLUTION OF PSYCHOLOGICAL OPERATIONS

American psychological doctrine is an outgrowth of three concepts: first, a felt national need for explaining America's position in and to the world; second, a pragmatic conviction that advertising, née propaganda American style, was an instrument peculiar to the American genius and deserving of national attention; and third, a reluctant acceptance of the proposition that psychological warfare, somehow or other, represented a tactical weapons system usable in war-time circumstances.

On the basis of this rather simplistic design the United States slowly evolved a doctrine of use variously termed and organized as propaganda in World War I, psywar in World War II, international information in the "Cold War" period (1947-60), and psychological operations in the Korea-Vietnam era. In retrospect, this pragmatic approach precluded the development of a single national doctrine and left the concept and programs to be fragmented among various agencies of government much as it stands today. The result for the policy makers and national leadership was a series of less than satisfactory half-triumphs and bureaucratic rivalries that by 1970 had caused a skeptical Congress to wonder about the cost effectiveness of American psychological initiatives.

In point of fact, however, the organizational impasse which so impeded the proper conceptualization of the psychological factor in national security planning and operations was only one reason for American myopia in this area. At root, a much more fundamental skepticism was at work, an anxiety deriving from the foundations of national character: in essence, Americans distrust political intrigue, propaganda and psychological manipulation. This, despite the impressive psychological victories of our history dating from the impact of the Declaration of Independence, to the offer of free land to the Hessians in the Revolutionary War period, down to the triumph of idealism in Wilson's Fourteen Points.² This suspicion is still with us and it is constantly reflected by Congressional refusal to permit the U.S. Information Agency to disseminate its output within the United States without specific per-case approval of Congress. While the American people have become quite accustomed to the manifold forms of commercial advertising, and while this same advertising industry and its expert practitioners have pioneered world acceptance of marketing and public relations, the political beliefs of the American people continue to resist the notion that psychological factoring has now become an instrument of modern statecraft. Americans tend to be long on

introspective idealism and short on patience; long on solutions and short on conceptualization. So too is it with the American overview to events psychologically considered or propaganda developed as a national motif. The American public believes rather than disbelieves that short tactical bursts of propaganda, wartime psychological coups cleverly arranged are acceptable, but deplorable in times of peace.

The psychological shortfalls in American policy and doctrine are due more to weaknesses in national world view than to technical deficiencies in operations. As Lippmann in his classic *Public Opinion* pointed out, "The world that we have to deal with politically is out of reach, out of sight, out of mind."³

This is a lesson still to be learned despite the Vietnams of this era, the communications revolution, and the intuitive American sense that something is wrong with our world view. It is precisely in our world view—a combination of innocence, idealism, and shrewdness that one finds the seeds reflecting national reluctance to enter fully into the international arena, though it scarcely can be doubted that in terms of treasure, commitment, and involvement the United States has done just that in the past quarter century. But as de Madariaga once pointed out, the world is full of foreigners, and Americans devoutly believe this as a psychological axiom of life. In short, America, as Max Lerner suggested, is a mixture of idealism and materialism based upon the "lengendry of America as the land of freedom."⁴ From this belief there has evolved historically a peculiarly American world view: America's institutions are best suited for the pursuit of freedom; America is a force for peace in a cynical world; America fights its wars emotionally and totally with a view to return to normalcy as soon as possible.⁵

Against this background one can begin to sense the dilemma presented by the development of the psychological factor in national security affairs. For an idealistic, technologically oriented people, and its leadership to accept the premises of psychological warfare and its political constructs in peace and war as a normal permanent instrument of policy is a barrier that the nation has not yet breached. Fundamental to any long term pragmatic use of the psychological weapon is a determination as to whether America's world interests are subject to moral or realistic judgments as the bases of action programs. Strangely, if one studies the published observations of such diplomatists as Dean Acheson, George Kennan, and John Foster Dulles, there is a constant tension or conflict between the moral and the realistic in foreign affairs, an outgrowth no doubt of the idealistic and the pragmatic strains in our national makeup.⁶ The fallout of this indecisiveness, amidst a history both strong in heroes and humanitarianism, as well as replete with villains and crassness, has resulted in the hobbling of a potentially vital aspect of modern military and diplomatic endeavor. Nonetheless, the United States has from time to time been enamored of the tool that is political warfare, psychological operations, international information, or progaganda,⁷ and it has been

through this manner of fretful advance rather than through a considered national policy that psychological doctrine and its operations have grown in toleration if not in total acceptance during this century.

The first World War provided the stage for the massive and widespread introduction of propaganda and psychological warfare as instruments of modern conflict. The worldwide effort was a curious mixture of success and failure based upon what Paul Linebarger perceptively identified as each belligerent's "peacetime nonpolitical propaganda facilities."⁸ The German effort foundered largely on national arrogance, bureaucratic inflexibility, and a firm belief in the Clausewitzian precepts of military victory. In short, Imperial Germany failed to communicate. At the time, and during the interwar years, it was a critically overlooked lesson. Britain, on the other hand, performed brilliantly on the psychological and political warfare front, exploiting the "rape of Belgium," German field terror, and the traditional bonds of Anglo-American language, commercial, and cultural ties. Yet British organizational efforts in the psychological area were compounded of four years of rivalry, agency jousting, and split commands. However, by 1918 the British had settled on an exportable Ministry of Information effort, a clever intelligence and communications security organization (monitoring and censorship), feeding both military and civilian channels, and a domestic National War Aims Committee which addressed the people of the United Kingdom.

The French effort, unlike the British, which featured its superb press communications and news facilities, was more modest and largely circumscribed by press control, image building, and astute diplomatic and cultural campaigning.

For the United States, the psychological warfare of World War I was a national departure from tradition, a giant step forward into the then-emerging world of international communications. It was both a temporary and a reluctant step, as seen by the structures which developed to harness and exploit the national motivational war effort and to "advertise" America as George Creel, presidential advisor and civilian director of the successful, free-flowing, and controversial U. S. Committee for Public Information, so proudly affirmed. The American effort as seen in the Creel Committee touched the civilian population, addressed neutrals, propagandized the enemy, supported our Allies, and even coped with the delicate matter of censorship. Administratively, Creel's bureau was supervised by a committee including the secretaries of Navy, War, and State. An intense rivalry, if not jealousy, arose between the State Department and the Creel Committee over jurisdiction abroad, a forerunner of behavior to be repeated in the immediate post-World-War-II period by the State Department and the Office of War Information (OWI) over the Voice of America. In contrast, the U. S. Army military intelligence quietly and effectively engaged in combat leaflet operations (at that time the only major available front line weapon) and pioneered enemy morale

studies, based upon a reading of German language press and indepth prisoner interrogations. The net effect of the army's program and Creel's innovative world advertising campaign was to lead to a German conviction that American propaganda was all-pervasive, and an American conviction that advertising was a unique native ability destined for greater things. It was out of this milieu that in the 1920s and 1930s America produced Walter Lippmann (who had served in the G-2 psywar effort) and his classic study of *Public Opinion* (1922); Edward L. Bernays (fresh from promoting the creation of the Czechoslovak Republic as a member of the Creel Committee), a leader in the public relations industry; and a George Creel, confident in his belief of *How We Advertised America* (1920), who could not switch to selling presidents.⁹ The organizational structure of World War I had passed into the society at large, and as Henry Stimson once remarked we had removed ourselves from the business of reading other people's mail.

And so the American republic lapsed into its disastrous period of normalcy which persisted largely unchallenged until the eve of World War II. Great strides were made domestically in advertising, public relations, and mass communications. Social science research began its first efforts into market research, audience measurement, content analysis, and communications feedback. Radio made its commercial entry into the American market place as a new, prosperous entertainment medium. The motion picture arrived as a determinant of middle class values, a form of propaganda in itself. The techniques of propaganda and psychological warfare in typical fashion were being put to efficient, pragmatic use in America's *Middletown* environment.

However, as America turned inward politically and psychologically, a new world struggle was in the making. The march of Nazi and Fascist totalitarianism had begun. The affairs of empire and aggression were met in political struggle. Psychologically, the tempo accelerated, and for the first time during the Spanish Civil War (1936-1939), shortwave radio played a role in warfare. The stage for radio warfare had been carefully set; it was no accident. Beginning in 1927 Holland had started broadcasting to the Dutch East Indies. In 1932, the British Broadcasting Corporation commenced its Empire Service (later to evolve into the famous BBC External Services). Nazi Germany launched its *Auslandsdeutsche* programs in 1933; Fascist Italy followed in 1935 with broadcasts to Italians in Latin America; and that same year Japan initiated Japanese and English broadcasts to Hawaii. France joined the race in 1936. The United States did not follow the lead until war had set in. The Voice of America dates from 1942. In addition, British, French, Italian, and German informational and cultural activities were increased around the world. The arena was being prepared systematically for the terror of total warfare and the intensity of ideological conflict. In Russia, the Soviet experiment had survived and the Communists were busily perfecting techniques of subversive propaganda. Shortwave radio as a form of contact across vast

Siberian distances quickly became an instrument of news, indoctrination, and communications. Political warfare, psychological conditioning, and national propaganda became everyday tools in the hands of the totalitarian mandarins. In commenting on the situation, Whitton and Larson carefully summed up the state of psychological preparations in the inter-war years:

Propaganda reflected with remarkable accuracy the foreign policies of the respective states. Aggressive states employed aggressive propaganda, revolutionary states subversive propaganda. The peaceful states either used no propaganda at all or entered the psychological conflict only when forced into it. . . . However, as the powers were preparing for the great trial of arms they had commenced the struggle. . . . with all-out radio war.¹⁰

A somewhat bewildered yet confident civilian America entered the lists December 7, 1941. With the enthusiasm of near perfect morale and conviction bred of the rightness of the "great crusade," America mobilized. With mobilization came the organization of a formidable, complex, and jurisdictionally divided psychological warfare machine. It was a study in American political fear, executive compromise, and bureaucratic rivalry involving Nelson Rockefeller's cultural operations in Latin America, coordinated through the State Department; General William Donovan's covert psywar responsibilities within the uniformed Office of Strategic Services (O.S.S.); Elmer Davis' civilian Office of War Information with duties in foreign and overt propaganda; and the individual armed services' effort in special warfare. In 1942, O.S.S. was given authority to develop psywar plans in support of military programs; by 1943, O.W.I. was given responsibility for official domestic war information dissemination, foreign information, and overt propaganda with linkages to the military through the Joint Chiefs of Staff and Theater Commanders. Psywar in the field was handled by a psychological warfare division in the European Theater and a psywar branch in the southwest Pacific area. In Europe, American psychological warfare liaison with the British was excellent; in the Pacific, cooperation with Admiral Louis Mountbatten's command was minimal.¹¹

It was largely on the bases of this multiple effort among often competing agencies that America's great reservoir of human talent and communications expertise was sent to war psychologically. American psychological doctrine was based upon two concepts: unconditional surrender and total victory. Politically, history has shown that the Allies might have achieved peace sooner had total victory not been the goal. Technically, while U. S. doctrine whatever its shortcomings was implemented with ingenuity and professional proficiency, by war's victorious end with military triumph at hand, the psychological weapon was once again largely dismantled. The reasoning paralleled the World War I experience: a democracy does not freely engage in political propaganda; psychological warfare is political trickery reluctantly used in all-out conflict.

Conspicuously absent from the early post-World-War-I-and-II arguments waged against the use of psychological warfare or propaganda

agencies in peacetime was the increasing role of ideology and systematic psychological manipulation of attitudes and events in the international arena. In this vein, the Congressional Record in 1918 could report such statements as:

A bureau of publicity to exploit the various acts and departments of the Government, . . . is a very dangerous thing in a Republic because. . . it has tremendous power, and in ordinary peace-time I do not think any party or any administration would justify or approve it.¹²

Yet, the highly democratic and parliament-conscious British consider psychological operations in a much more systematic and long term manner which might be summarized as (1) determining the opinion not only of an opposing government but of the public on whose support that government depends and then (2) influencing that opinion.¹³

Thus, while British realism expressed the Crown's modest but well-defined approach to psychological and political warfare, and while the Soviet Union was mounting a massive and aggressive postwar propaganda effort directed at the West, the United States was fast retiring its psychological and communications functions. No fundamental doctrinal evaluation or psywar critique flowed from the wartime experience. Few scholars or thinkers addressed the problem.¹⁴ The answer to America's postwar psychological posture came not from doctrine or from organization, for both were largely lacking, but from the fear generated by the worldwide propaganda, subversion, and espionage of the Soviet Bloc led by the USSR. In the name of anti-Communism, the U.S. government girded itself reluctantly once again, and, as part of the rearming, the Voice of America was saved from extinction, a residual information effort was maintained within the State Department, and cultural relations were, interestingly enough, upgraded in image and vitality. The military services, constrained by budgetary restrictions, inexperienced career personnel, and a World-War-II mentality, relegated psychological operations to contingency plans and reserve mobilization billets. The armed forces could not afford the luxury of the psychological weapon.¹⁵

It was on this thread of organizational chaos and doctrinal fear that the U. S. fought the Korean police action, a desperate, bloody exercise in political warfare which left Americans and their military leadership profoundly frustrated and disappointed because the American urge to victory, military decision, and decisiveness had been blunted. U.S. military professionals mindful of the administrative and personnel difficulties of World-War-II psywar were content to allow an unprepared, unequipped, and uncertain U.S. Information Agency¹⁶ to carry the major burden under President Harry Truman's "Campaign of Truth."¹⁷

During this entire postwar period of intensifying "Cold War" (1948-60), the American emphasis was largely on organization and channels, a calculated effort to satisfy the various interested governmental agencies. However, individuals and government-sponsored research urged clearer assignments of responsibility, an acceptable priority for psychological doctrine, and a trained professional cadre capable of operating internationally across the spectrum of psychological and informational

activities. It was during this period that American psychological doctrine and operations first began to mature, if not to be fully accepted or implemented as modern instruments of statecraft. Pushed by the Army (especially the Office of the Chief of Special Warfare), supported by the Department of Defense's Special Operations and Psychological Operations groupings, and encouraged at the White House level by such leading citizens (and practitioners) as C. D. Jackson, William Jackson, and Nelson Rockefeller, the movement, slow in operation, began.¹⁸ Although the State Department continued to view propaganda and psychological operations as a combination of gimmickry and conduct unbecoming a diplomat, the press of world reality pushed the United States inexorably toward an awareness of the new psychological dimension of international political communications. Without quite realizing it, the psychological factor was becoming the "new diplomacy."¹⁹

Throughout this era the central civilian agency in the drama—the U.S. Information Agency (U.S.I.A.)—moved with caution and uncertainty. Created in 1953 by executive order as an independent agency of government charged with "telling America's story abroad," the Agency was given responsibility for overt international information activities of the U.S. government, some responsibility for "gray" area propaganda and liaison in the darker arts with the contingency military offices concerned, and an even more nebulous relation with the Central Intelligence Agency and its parent National Security Council. In addition, U.S.I.A., by arrangement with the State Department, was responsible for the operation abroad of cultural relations. Thus, one agency, never really completely accepted by the Congress, was charged with U. S. overseas press relations, overt propaganda, cultural relations, and from time to time (as in Korea and later in Vietnam) psychological warfare activities.²⁰ The Agency gradually developed an operational split, and no wonder, with a continuum of responsibilities, some almost contradictory (commented one officer: "waging psyops in Korea in one tour of duty and being cultural officer in Moscow the next tour is not exactly conducive to consistency and credibility"), little authority within the higher councils of government, and a career orientation among its officers toward the State Department's foreign service officer corps.²¹ It was a time approximating what Bernard Rubin describes as the need for the emergence of "psychological peacemaking."

III. THE SOVIET PSYCHOLOGICAL CONCEPT

Against this extended background of administrative and policy uncertainty, the Soviet Union through its international Communist network and ideological control mechanism developed a worldwide "organizational weapon" emphasizing a Pavlovian-repetitive doctrine of propaganda, a highly developed sense of tactics based upon political and psychological goals, and a competence in informal transnational penetration approximating what Andrew Scott terms "the revolution in statecraft."

While Americans argued about how to present the truth, and how to

organize for psychological operations, the Soviets raised ideology to an almost medieval level of zeal, and practiced indoctrination as a tried and true instrument of agitation and propaganda. Organizationally, there was no question but that the Soviets appreciated both the high risks and high rewards of aggressive political and psychological warfare. Starting with Lenin, who was a superb political organizer and propagandist, the Soviet state with its Communist ideology never lost sight of world opinion and psychological advantage. Their approach, contrary to the American technique, was not, as Wilbur Schramm has pointed out, "the word," but rather the hardened organizational cadre. "With the Communists," he observed, "there is no sharp separation between words and deeds, between political and military warfare."²²

One can attempt to sum up the basic postwar distinctions between the American and Soviet approaches. The Americans have traditionally failed to integrate the psychological principle at the highest levels of government. Psychological warfare has been considered an orphan both of military operations and foreign affairs programming. Operationally, American practitioners have tended to be media oriented, public relations inclined, suspicious of communications research, and firm believers in the spoken and written word. As suggested, the Soviets, for their part, have been organizationally zealous, doctrinally oriented, and inclined to integrate psychopolitical inputs into strategy and tactics, whether diplomatic or military, before implementing programs of operations.²³

IV. DEVELOPMENT OF THE PSYCHOLOGICAL FACTOR

As pointed out in the conference report treating "American Public Diplomacy," whatever the pragmatic successes or shortfalls of American psychological operations may have been in the last half century, and despite intense Soviet interest in the psychological weapon, dramatic new inputs—involving technology, mass communications, private and public constituencies, and instant news—have arrived on the scene, changing forever the earlier political and military stance of psychological operations, and projecting a vastly different set of circumstances to be considered by Americans in the decade ahead.²⁴

There is little doubt that the communications revolution of the 1960s, involving the worldwide availability of transistor radios, television, and multichannels of communications, including satellites, has made its mark on doctrine and policy of democrat and totalitarian alike. Today, the psychological impact of rising expectations and rising frustrations converge at a point on the communications spectrum, making the psychological consideration of policy an absolute must. Political communication, as Murray Dyer long ago pointed out, must be organized and respected.²⁵ This fact of psychological life is now generally accepted whether it be in the "selling of a president" or, as James Reston put it, in dealing with the "artillery of the press."²⁶ Thus, the advent of a world communications grid has forced the acceptance of a new psychological dimension in international politics and war. A goodly measure of the distress, anger, and frustration over Vietnam stems from the operations of this psychocom-

munications network. Older precepts of privilege, sanctity of information, news censorship, primitive propaganda principles, hallowed military traditions, and standard tactical operating procedures have been literally torn asunder, and the task for the 1970s comprises a basic rebuilding and re-formation of concepts. In the modern idiom of audiovisual communications, it is increasingly difficult to separate domestic information from international political communications. It is likewise well nigh impossible to divide act from word, example from preachment. The spectacular rise of television as a worldwide political instrument has rendered largely ineffective American compartmentalized psychological and propaganda operations, whether they be military as in Vietnam, informational as practiced by U.S.I.A., or news promotional as increasingly urged by government public affairs specialists.²⁷ What these developments suggest, of course, is that not only have our preoccupations and moderate successes in technique become outmoded, but the twenty-year search for a psychological doctrine has been overtaken by a revolution in technology, which as McLuhan has shown, led both to a "world tuned in" and yet sophisticated enough to differentiate between the hard images of radio and television and the frequently softer hues of official spokesmen and psychological warriors.²⁸

V. U.S. ORGANIZATION FOR PSYCHOLOGICAL OPERATIONS

Following what might be historically described as phase I of the "Cold War" (1948-1960) in which the United States stood firm politically and ideologically in defense of its overseas commitments, the complexities of Cuba, the Dominican intervention, and the extended Vietnamese conflict descended upon us and America, again, unprepared psychologically, entered the era of wars of national liberation, a complex model of social, psycho-political, and military factors designed to exploit national vulnerabilities, erode social and economic institutions, and encourage eventual indigenous insurgent takeovers of developing countries. From a psychological point of view, the choice of weapons was and is superb. A modern, conventional high-technology military force is at a basic disadvantage in such a circumstance. The warfare is more political, terroristic, and unconventional than traditionally military. It is warfare fought politically with the help of guerrillas and military force rather than warfare fought militarily with the help of political force. At no point, as Sir Robert Thompson has warned again and again, was the United States prepared adequately to understand and cope with this style and concept of people's war.²⁹ By 1962, President John Kennedy had tried to retool for political warfare with emphasis on Special Forces operations, military advisors, psychological operations, and coordinated overseas mission activities.³⁰ With the war escalating in 1965, President Johnson ordered creation of new forms to counter the threatening success of a Communist-directed people's war. The effort was organizational rather than doctrinal. At the Washington level, interested agencies under State Department chairmanship were layered into the Senior Interdepartmental Group with Interdepartmental Regional Groups immediately below. Beyond that, a Washington-level Vietnam Working Group was established and at the

theater level psychological operations were coordinated and directed by the Joint U.S. Public Affairs Office (JUSPAO) with direction for military political warfare and combat psychological operations flowing from this innovative, functional joint civil-military organization.

However, despite a determined bureaucratic effort at coordination, the intensity of the war, the backlash at home brought on by the psychological impact of the communications revolution, the growing frustration of the U.S. Army over its increasing difficulties, and the U.S.I.A. reluctance to practice psychological warfare on a limited resource base led to a splintering of the U.S. psychological effort in-country. Once more, doctrine, never strong, suffered, and technique became an end in itself.³¹ Today, with America firmly entered into the 1970s, the permanent organization of national PSYOP is still in large part philosophically ad hoc and administratively careerist oriented; the military, principally the U.S. Army, is still limited by manuals, inflexibility, and the system—although the Army has imaginatively established a career pattern for personnel interested in psychological operations, military assistance, and civil affairs. The time is opportune for a searching review of military-civil operations in the psychological-informational, counterinsurgency, and cultural areas.

VI. TOWARD A DOCTRINE OF THE 1970s

This paper has treated at considerable length the evolution of the American approach to psychological doctrine and operations. It has attempted to indicate where modern communications and Soviet Communist concepts enter the equation. It has done so because it is very nearly impossible to grasp the strengths and, above all, the weaknesses of the U.S. psychological effort without a fairly detailed review of where we are today and where we have come from, psychologically speaking. It seems apparent from what has gone before that America faces a serious task in pulling its psychological forces together for what promises to be the first full decade of instant world communications.

Let us briefly summarize the state of the art:

1. The United States lacks a coherent, government-wide doctrine of psychological operations.
2. The State Department still resists development of psychological initiatives in favor of traditional diplomatic method and leverage.
3. The U.S. military, for whom psychological operations remain tactically and politically important in a revolutionary era of change, has largely failed to adjust to the technical and professional standards required in today's communications environment.
4. The U.S. Information Agency stands in need of re-examination and reorganization. It has slowly lost its mission in the onrush of events and change, and it continues to maintain a structure based essentially on 1953 models.
5. Diplomacy secretly arrived at has given way to international politics psychologically arrived at. Both Moscow and Washington, not to mention Peking and Hanoi, are painfully aware of the open covenant of

public opinion and the growing participation of the masses in affairs of the earth.

Where does this situation leave the cause of the psychological dimension?

First, it demands that reality be faced. The United States has no alternative but to accept the necessity of a prudent psychological doctrine based upon legitimate and achievable foreign policy and national security needs and goals. A State Department that resents the loss of historic authority should no more prevent the updating of doctrine and technique than should a weakened Information Agency resist the implications of modern communications research or the military refuse to develop expertise in and sensitivity to psychological intelligence.

In the 1970s psychological operations of necessity will grow in importance and will encompass the entire foreign and military affairs community. The process has in fact already begun. Military planning and decisionmaking today risk failure if the psychological dimension is overlooked.³² A recent U.S. Navy-sponsored study went so far as to suggest that to be responsive to the strategic environment and support the limited objectives of U.S. policy, "military operations should be conceived, planned, conducted and evaluated in the light of what they may or do communicate to foes, allies, and neutrals among diverse populations."³³ This type of thought does not surprise the modern communicator or psychological planner, but it does represent a departure for the policy decisionmaker. Yet evidence is rapidly accumulating that the new communications environment is at last being accepted in the strategic planning process. As such, it would appear likely that the psychological factor in national security will be in the 1970s a fully accepted equal to military, political, and economic inputs.³⁴

If, as a result of reality, psychological doctrine does evolve as a handmaiden of necessity, it will surely not be confined to military PSYOP, but rather it will become an integral consideration in the development of national strategy and policies. It will cut across the government propaganda effort, across administration public affairs postures, information and cultural affairs. It will affect military training and deployments, tactics, and future operations. The 1970s will, in short, bring about a psychological environment made mandatory by communications technology and information flow.

This thesis is reinforced when one considers the array of security problems we face today without ready solution. For example, what permanent impact has the first televised war in history—Vietnam—had on domestic and foreign public opinion? Given the high discipline and strong psychological motivation of guerrillas and insurgents involved in "wars of national liberation," how can conventional military strategies be expected to defeat mobilized resistance and public opinion? How is mass opinion to be analyzed and mobilized in insurgencies? How is national policy to be sustained by popular support in the face of mass involvement through instant communications? One could extend the list almost indefinitely, but it is sufficient to observe that in such a world the psychological factor

becomes a basic consideration, and a doctrinal approach must inevitably follow.

Another area of change in the 1970s will be the reorganization of the military and foreign affairs approach to psychological operations. The Department of Defense, the military services, the State Department, U.S.I.A., and the Central Intelligence Agency will be forced to reform agency structures to conform to national need. Indeed, the intelligence community itself will be called upon to accept the challenges of warfare and diplomacy psychologically waged in what will be a major step forward in providing facts and information fundamental to the operational soundness of such programs.

Finally, after a long period of intellectual hostility there will be a gradual rapprochement between the community of psychological operators and the research community. The 1970s should provide the impetus for pointed experimentation and research leading to development of techniques for the measurement of effectiveness, methodologies of analysis, and key psychological indicators. With the advent of communication theory, and its rapid advance, the professional calling and training of the psychological and information specialist will take on new meaning. The journalist turned propagandist, the teacher turned cultural ambassador, the military officer turned psy-warrior and advisor will move from the intuitive state (which will still be needed) to the professional level of communicator.

The 1970s will see a change in military environment, in professional training, in world cultural and psychological contact. Nation building will give way in our military assistance plans to the civic culture; military tactics will be leavened by increased attention to communications; and national strategy will find the psychological dimension as readily acceptable by the decade's end as the tank and machine gun were by November 1918.

NOTES

¹. As deputy assistant director of field operations (Joint U.S. Public Affairs Office) in Vietnam, 1965-1966, and later as Assistant Director (research) of the U.S. Information Agency, the author found the effort to devise workable methodologies both urgent and futile.

². The development of the Fourteen Points is in itself a fascinating insight into the potential of psychological operations. Edward L. Bernays in an interview with the author (7 June 1967) affirmed that the Creel Committee on Public Information, which functioned as a World War I temporary agency, was basically responsible for the development and initial dissemination of the 14 Points. The initiative came from Creel's representative in Russia who saw political advantage to be gained in Central and Eastern Europe by such an announcement.

⁴. Max Lerner, *America as a Civilization*, Vol. II (New York: Simon and Schuster, 1966), p. 883.

⁵. While it is outside the scope of this paper, it is the widespread questioning of these beliefs, occasioned by the youth generation, the Vietnam War, and the challenge to governmental credibility that has brought serious ferment to American society and its institutions.

⁶. See Jane Van Hoogstrate, *American Foreign Policy: Realists and Idealists* (St. Louis, Mo.: Herder, 1960).

⁷. Typical of American ambivalence is the confusion engendered by the profusion of terminology carefully defined to explain and rationalize why America engages in psychological persuasion. For example, the Joint Chiefs of Staff, the U. S. Information Agency, and the

Central Intelligence Agency can and do agree to definitions but the agreement ends there, and individual agency practices vary widely.

⁸ Paul M. A. Linebarger, *Psychological Warfare* (New York: Duell, Sloan and Pearce, 1954), p. 62.

⁹ The literature of America's World War I propaganda effort is largely personal, idealistic and immodest. Among the most informative books are the following: George Creel, *How we Advertised America* (New York: Harper and Brothers, 1920); Harold D. Lasswell, *Propaganda Techniques in the World War* (New York: Knopf, 1927); Paul Linebarger, *Psychological Warfare*; and James Mock, and Cedric Larsen, *Words that Won the War* (Princeton, N.J.: Princeton University Press, 1939).

¹⁰ John Whitton and Arthur Larson, *Propaganda* (Dobbs Ferry, N.Y.: Oceana, 1963), pp.38-39.

¹¹ W. E. Daugherty, writing as co-editor (with Morris Janowitz) of *A Psychological Warfare Casebook* (Baltimore, Md.: Johns Hopkins Press, 1958.) said of the period "U.S. propaganda was more the result of trial and error planning and ad hoc improvisations than of case blueprinting." (p. 126). The literature, however, is rich in the rather innovative, often brilliant successes organized by U.S. practitioners ranging from the operation of Radio Luxembourg to the U.S. Navy broadcasts aimed at German submariners, and Captain Ellis Zacharias' profoundly effective broadcasts to the Japanese home islands.

¹² U.S. Congress, House, *Congressional Record*, 65th Cong., 2nd Sess., 1918. (Congressman Gillett) (Washington, D.C.: Government Printing Office), p. 7915.

¹³ See M.R.D. Foot, *SOE in Europe* (London: HMSO, 1966) for an insight into the British approach.

¹⁴ Among the faithful and concerned few were scholar/practitioners such as Harold Lasswell, Phillips Davison, Paul Linebarger, C.A.H. Thomson, Daniel Lerner, Hans Speier, and Martin Herz.

¹⁵ It is a sad truism that until the Vietnam War the American military hierarchy, conventional and hardware oriented as it then was, saw little need for psywar expertise, especially since career men found it "promotionally disadvantageous" and, perhaps more tellingly, were suspicious of the talented, unorthodox, decidedly nonmilitary "psy-warriors" who filled the ranks during wartime.

¹⁶ The saga of our international information effort and the organizational ups and downs of the information agency is without the scope of this paper: nonetheless, the story is symptomatic of our national indecision regarding the role of psychological operations.

¹⁷ In fairness to the military, delimitation agreements and organizational arrangements bridging the Truman-Eisenhower administrations, ranging from JCS contingency planning (largely army oriented) to the Psychological Strategy Board and the Operations Coordinating Board, were efforts to place psychological policy control within the State Department control, and action programs within CIA and USIA purview, with the military services often cast as subsidiary role players.

¹⁸ Tribute must be given to the many able experts in the psychological vineyard ranging from Murray Dyer for his rethinking of doctrine, Lloyd Free and his pioneering work in international public opinion research, Paul Blackstock for his careful examination of Soviet and Nazi psychological techniques, Wilbur Schramm for his studies in mass communications, Joseph Klapper for his analyses of shortwave propaganda, and Robert Strausz-Hupe for his penetrating theory of Sino-Soviet protracted conflict based on the psycho-political dimension.

¹⁹ See A. S. Hoffman, *International Communication and the New Diplomacy* (Bloomington, Ind.: Indiana University Press, 1968). Also W. P. Davison, *International Political Communication* (New York: Praeger, 1965). During this period as operations and doctrine were being argued and advanced, government experts writing under pseudonyms often took their cases to the public. Typical of this category of period argument were John Amory's *Around the Edge of War*. (New York: Potter, 1961); and Christopher Felix's *A Short Course in the Secret War* (New York: Dutton, 1963).

²⁰ In time of declared war, USIA would fall under military field control. This is legally acceptable, but in point of experience rather useless since Korea, Cuba, Dominican Republic, and Vietnam were involvements short of declared war.

CHAPTER II THE NATURE AND SCOPE OF PSYOP

INTRODUCTION

During the 1960s, the use of psychological instruments for national political and military purposes expanded dramatically. As a result, by the early 1970s military employment of PSYOP was no longer limited to combat propaganda or psychological warfare, was no longer viewed, as in World War II and Korean conflict times, as a specialized and subordinate operation. Today the scope of PSYOP encompasses diverse activities—nonmilitary as well as military—in support of national objectives.

PSYOP is communication and therefore covers the entire field of human action. (See the essay by Phillip Katz in this chapter.) Giving rise to the greater scope attributed to the psychological factor in international political and military relations has been a fuller understanding of the field of communication. Communications research has grown so rapidly that many sociological and psychological concepts previously confined to the academic world have influenced or compete to influence revisions of PSYOP concepts and doctrine.

As long as PSYOP retained its constricted image as a minor and almost arcane support to military operations, such matters as rational training, thorough understanding, systematic evaluation, and resulting improvement were elusive. Recognition that PSYOP is essentially a form of communications has both clarified the wide range of potentially contributing fields (for example, psychology, sociology, communications, political science, economics, and anthropology) and, at the same time, obfuscated many of the previously accepted assumptions of PSYOP by subjecting it to the debates going on within these diverse fields.

Even the recognition in the early 1970s that communications are an important part of the political strategy of all countries did not result in a willingness to fully acknowledge psychological strategy and initiatives as acceptable in American political and military operations in peacetime. For years, reluctance to accept the use of persuasive communications precluded the development of basic conceptualization and systematic doctrine. Thus, it is understandable that confusion arose about several doctrinal concepts. Some contended that official Defense Department definitions were too broad and nebulous.

The situation might have continued indefinitely if the United States had not become intimately involved in the socioeconomic development of many foreign nations in the 1960s. The cruciality of communications was evident in carrying out this massive and multifaceted commitment to assist developing areas. Technical cooperation, security assistance, development of supporting national consciousness—each aspect of the American effort depended upon communications. In this context, a specific area of concern is how PSYOP relates to other overseas, nonmilitary missions and activities such as civil affairs, civic action, community relations, troop information, and public information.

Perhaps as a result of this experience, a large effort to integrate psychological operations with the other techniques of supporting national objectives was undertaken in the military. By the early 1970s this effort was still in its formative stages, often reflected more in training and long-range planning than in operations, but the recognition that PSYOP was closely related to other politico-military tools was clear. Indeed, the U.S. Army, in particular, attempted to develop career programs recognizing PSYOP as one of the key politico-military fields.

The essays in this chapter reflect the broad range of thought associated with the nature and scope of PSYOP: the reasons for its importance, its relationship to communication theory, the context of its employment, and the relationship of PSYOP to other Army activities as well as to broad policy objectives. Whatever fluidity of thinking is represented by these essays, PSYOP portends to become an even more essential activity in the years ahead.

ORIGIN OF PSYOP TERMINOLOGY*

BY WILLIAM E. DAUGHERTY

An account of the origin of the terms PSYWAR and PSYOP

It has been amply demonstrated that American employment of propaganda, psychological warfare (PSYWAR), psychological operations (PSYOP), or whatever one chooses to call the activity that these terms are intended to describe is neither revolutionary nor un-American. In this essay the origins of the terms "PSYWAR" and "PSYOP" will be described.

PSYWAR AND PSYOP

The terms "psychological operations" and "psychological warfare" are often used interchangeably to identify an activity or function as old as human conflict or intercultural group relations. Both terms, however, are known to be of relatively recent origin. Psychological warfare was first used in 1920 and psychological operations in 1945.

The British military analyst and historian, J. F. C. Fuller, is believed to have been the one who coined the term "psychological warfare," when in 1920, in a scholarly analysis of lessons learned during World War I, especially as these related to the employment of such new weapons as armor, he allowed his mind to wander imaginatively about the character of the future battlefield. In his treatise on tanks he prophesied that traditional means of warfare, as then known and understood, might in time be

replaced by a purely psychological warfare, wherein weapons are not used or battlefields sought . . . but [rather] . . . the corruption of the human reason, the dimming of the human intellect, and the disintegration of the moral and spiritual life of one nation by the influence of the will of another is accomplished.¹

Although Fuller's employment of the term is believed to have been the earliest recorded use of the phrase, there is not thought to be any direct connection between his use and the widespread adoption of it by Ameri-

*Original essay by William E. Daugherty.

cans on the eve of World War II. The British did not adopt the term to describe what both they and the Americans hesitated to describe as propaganda operations. Instead of employing the term "PSYWAR," the British adopted the term "political warfare" to describe those activities that Americans came to identify in time as psychological warfare or PSYWAR. Since World War II the British have followed American practice and now use the term "SYWAR" to describe the activities they previously identified as political warfare. The earliest recorded use of the term "psychological warfare" in an American publication occurred in January 1940 when an article entitled "Psychological Warfare and How to Wage It" appeared in a popular American journal.²

The earliest recorded use of the term "psychological operations" occurred early in 1945 when Captain (later Real Admiral) Ellis M. Zacharias, U.S. Navy, employed the term in an operation plan designed to hasten the surrender of Japan. Without any description or explanation, the term was used in the context "All psychological operations will be coordinated both as to times and trends in order to avoid reduction of effectiveness of this main operation."³ The next use of the term was in 1951, when the Truman Administration renamed an interagency strategy committee giving it the title Psychological Operations Coordinating Committee. Neither in 1945 nor in 1951 did the use of the term "psychological operations" create so much as a ripple of interest.

Although the Department of the Army made the change in 1971, it was not until the 1960s that psychological operations came to supplant psychological warfare as the all-inclusive term in common use. Any explanation of this development must take into account the fact that Americans have become increasingly concerned about the continued use of a term that includes the word "warfare" to describe an activity that is directed to friends and neutrals as much or more than to hostile or potentially hostile people. Examples are the Lebanon crisis of 1958 and the Dominican Republic intervention of 1965.

In the late 1960s, with the widespread use of psychological operations in Indochina, emphasis was placed upon the need to integrate PSYOP with other training and operations and upon the reinforcement which other missions could lend to psychological operations. The psychological objective of military assistance and civic action, for example, was more fully stressed.

WHAT IS COMMUNICATION?*

BY YASUMASA TANAKA

A discussion of the process of communication as it relates to persuasion.

From mentalists to behaviorists, over the last quarter century, an intensive effort has been made to construct a general model of human behavior. Models which can explain human behavior have recently been constructed by a number of behaviorists. Among these is a variety of "cybernetic models" that variably take into account the communication and control aspects of human behavior. In the simplest terms, these models presuppose a series of psychological processes in which one individual's or organization's behavior, in the form of explicit "output" information produced by him or it, is dependent upon the "input" information that an individual or organization may receive from other people or organizations and from the environment. In order to examine their validity and discover their relevance to our problems, let us look briefly at a few of them.

As an initial point of reference, it is useful to keep H. D. Lasswell's classic formula in mind. The scientific study of communication, he says, involves discovering "Who Says What, In Which Channel, To Whom, With What Effect."¹

There is another type of model, the "cybernetic" one, first introduced by C. E. Shannon for telephone communication and subsequently adjusted for human communication situations by C. E. Osgood.^{2, 3}

On the basis of the "theory" of these models, we now can make a more formal statement about the nature of human communication behavior. We can assume the existence of various processes of *decoding* and *encoding* between input and output events. *Decoding* here refers to the way in which the individual human (or organization) receives input information from his environment—namely, the internal reaction caused by the input on the subject. *Encoding* designates those processes whereby the individual human (or organization) chooses some response, in the form of output, to the environment surrounding and affecting him. That which psychologists call the "mediation process" is thus considered as the bridge between *decoding* and *encoding*. In the simplest terms, it is the process which "mediates" between the sensory nervous processes of *decoding* on the "input" side and the motor nervous processes of *encoding* on the "output" side. Even in comparatively simple acts, such as making a speech, an individual's communicating behavior is complex, susceptible to many factors, as suggested above, and it is a continuously renewing process whereby he is always adapting to his environment.

At this point the term *feedback* is also relevant. It has been stated thus:

The action is initiated by an "incongruity" between the state of the organism and the state that is being tested for, and the action persists until the incongruity . . . is removed.⁴

*Excerpts from "Psychological Factors in International Persuasion," *The Annals of the American Academy of Political and Social Science*, Vol. 398 (November 1971), pp. 50-54. Reprinted with the permission of the American Academy of Political and Social Science and the courtesy of the author.

According to this view, the fundamental building block of the social system is the feedback "loop."⁵

Dealing with the complex organization and mechanisms of government, Karl Deutsch defines *feedback* as "a communication network that produces action in response to an input of information, and *includes the results of its own action in the new information by which it modifies its subsequent behavior.*"⁶ In other words, by this feedback mechanism, individual humans (and organizations) can correct errors and adjust their behavior to the continuously renewing environment.

Furthermore, in view of the present state of communication technology, interpersonal interaction is not necessarily limited to a face-to-face situation. The whole or part of an encoded message may be quoted in a newspaper, or broadcast by radio and television, or even relayed via a communication satellite to local stations in foreign countries, for literally universal "mass consumption." Then, as the feedback loops become more complex, the source will need some extended "scanning" devices or "monitors," to gather feedback information. He will continuously need to keep an eye on local and national newspapers, radio or television newscasts, and even on the mass media in foreign countries!

PERSUASION AND THE EFFECTS OF COMMUNICATION

Persuasion may be defined as the art of "winning men's minds by words." The basic premise here is that persuasion is an act of communication. We must note, however, that it is a special kind of communication, and it is not involved in all communication situations in which behavior is influenced by a set of input stimuli. In order to be persuasive in nature, the communication situation must involve a conscious attempt by the communicator to influence the thought and behavior of the receiver through the transmission of some message.

Persuasive communication, therefore, implies a judgment of the situation in terms of the intentions of the communicator and the resultant thought or behavior change of the receiver. Persuasive communications can thus be judged with respect to their success in producing desired thought or behavior, or their failure to do so. Examples of success or failure of persuasive communications can be easily seen in election campaigns, advertising, or international diplomacy.

Research on persuasive communication embraces the study of persuasiveness, on the one hand, and persuadability on the other. It also involves the study of attitudes—how they are formed and how they can be changed. The focus of recent research on persuasion is on interrelationships among these variables, and the studies have been increasingly empirical or "experimental," oriented toward the theory of attitude organization and change.

Comprehensive reviews and summaries of the relevant literature on the subject can be found in recent publications by E. P. Bettinghaus,⁷ R. L. Rosnow and E. J. Robinson,⁸ and W. J. McGuire.⁹

PSYOP AND COMMUNICATION THEORY*

BY PHILLIP P. KATZ

Communication involves the total spectrum of human actions. In itself, communication is neither fact nor fiction; it is what the recipient believes it to be.

The purpose of this essay is to relate current communication theory to PSYOP. As noted in the introduction to this chapter, PSYOP is communication. To be precise, the function of PSYOP is to use communication to influence behavior. Therefore, a basic understanding of the nature of communication, the role of communication in a social environment, and the process of communication (how people communicate with each other) is necessary in order to develop meaningful and dynamic PSYOP programs.

THE NATURE OF COMMUNICATION

Communication, in a very broad sense, includes the various processes by which one person influences another and involves the total spectrum of human actions, including speech, written matter, music, drama, the pictorial arts, and other forms of behavior. Charles Cooley defines communication as "...the mechanism through which human relations exist and develop—all the symbols of the mind, together with the means of conveying them through space and preserving them in time..."¹

Melvin De Fleur notes that man is born into an ongoing and elaborate culture, and an important aspect of this culture is the "set of conventions which exist concerning the relationship between signs and their referents."² Man as a social being develops various habit patterns that permit him to respond to particular gestures, verbal and other, having as their

* Original essay by Phillip P. Katz.

referents objects and events as they occur in their particular world of reality. A person's understanding of a particular symbol is the set of responses that the individual generates as a result of the stimulus of the symbol. The participation of the individual in the language process gives him the ability to communicate with himself (think) and with his social group. The entire process is structured around the social group. Human communication is the basis for group norms; it is the means by which social control is exerted, roles are allocated, coordination of effort is achieved, expectations are made manifest, and the social process is carried on.³

Communication should also be considered as the sharing of information. Each individual or social group considers information or ideas based on his needs, comprehending and using the information in a manner that best suits his particular interests.

Human communication involves action; it is not mystical or magical; it is routine, daily, accepted, and normal. To understand communications one must understand, in a very real sense, people. Training in communication is deeper than language training. It requires the ability to understand and relate the content of communication (messages) to the aspirations of people, groups, organizations, and societies. The ability to understand how people relate to each other is crucial. For example, if a communicator develops a series of persuasive messages directed toward a guerrilla force, a very real understanding of interpersonal relationships at squad, platoon, and company levels is necessary for effective communication. In support of this point, Elihu Katz and Paul Lazarsfeld state that a key to understanding the content and dynamics of individual opinions and actions is accurate comprehension and knowledge of the content and dynamics of small groups.⁴

Individuals living in society generally desire to adhere to the opinions, attitudes, and habits of those with whom they are motivated to interact. The social reality of group life makes it clear that individuals influence each other's perceptions, and the individual's way of seeing reality is based on the "real world" around him. On the whole, all social groups require a degree of conformity, and a revolutionary movement develops definitive methods and procedures to insure conformity to group norms and values.

A final but significant point is that groups, like individuals, have goals, and such goals often cannot be achieved without a degree of consensus. It is obvious that if a majority of the individuals cannot agree on the proper course of action, they cannot act collectively. It is only through meaningful communication that collective action and consensus can be attained.

THE ROLE OF COMMUNICATION

Communication then, can be considered as the great relating tool. It relates individuals to each other and individuals to historical perspective. This makes group functioning possible and allows societies to live in harmony.

However, very seldom does communication have a single function, nor is the manifest content of the message always the important content. Harold Lasswell lists the functions of communication as follows: first, the surveillance of the environment; second, the correlation of the parts of society in responding to the environment; and third, the transmission of social heritage from one generation to the next.⁵ With the understanding that an important function of communication is relating people to each other or to groups, or to history, and that the latent content of a message is significant, we can classify the vast majority of social communication under four major headings:

1. To inform
2. To instruct or teach
3. To entertain
4. To persuade

The above classification is from the viewpoint of the sender or the originator of the message. From the receiver's point of view we should list:

1. To understand
2. To learn
3. To enjoy
4. To dispose or decide

It is important that PSYOP program managers understand that communication content (messages) can be designed to perform all of the functions stated in the previous paragraph, any one of the four, or any mix.

David Berlo makes the point that the inform-persuade-entertain distinction has led to confusion in that there has been a tendency to interpret these purposes as exclusive entities; that is, one is not giving information when he is entertaining; one is not entertaining when he is persuading, and so forth.⁶ This is not so! Yet the distinction is frequently made. Berlo emphasizes this point as follows:

...it is popular today to distinguish between education (inform), propaganda (persuade), and entertainment (entertain). In the public media, we try to distinguish, between educational programs and entertainment programs—without providing any reasonable basis for such distinction. Some professional communicators in the press and education state that they are not trying to persuade people, they are merely giving them information. Others view the entertainment industry as something independent of persuasion and ignore the effects their messages might be having on the levels of knowledge, thought processes, and attitudes of their audiences. The theatre, for example, is a distinguished vehicle of communication with a considerable tradition and heritage. Many people would classify the theatre as an "entertainment" vehicle: Yet countless examples could be given of plays that were intended to have, and did have, significant effects on an audience, other than "entertainment." *7

The inform-instruct-entertain-persuade distinction causes difficulty if we assume that these are independent functions of communication. As

* Reprinted from David K. Berlo, *The Process of Communication: An Introduction to Theory and Practice*, 1960, with the permission of Holt, Rhinehart and Winston, Inc., copyright holder.

indicated above, sometimes it is difficult to relate them directly to experience; that is, "knowing one when we see one." Too often the message (leaflet, speech, skit, newspaper article, or movie) is the only item examined in order to determine communicative purpose.

The inclination to consider the role of communication along rigid lines is often found in U.S. policy. Frequently, the role of PSYOP is viewed as a loudspeaker and leaflet operation with a persuasive function. Furthermore, even the United States Information Agency (USIA) separates its activities into "information" and "cultural" programs, with the tendency to consider information programs from the viewpoint of the American journalist; to associate cultural programs with the objectivity of the U.S. educator; and to view persuasive programs as a function of the propagandist or PSYOP. Of course, a PSYOP organization that follows a rigid distinction as to the functions of communication is at a distinct disadvantage competing with communication viewed as a political weapon and directed at the "whole person," skillfully combining the four functions of communication.⁸

To the National Liberation Front (NLF) in Vietnam, for example, social institutions such as schools and membership associations are as important as the mass media in the total PSYOP effort. Especially at the tactical level the agitprop cadres of the NLF keenly understand the multipurpose function of communication.

Therefore, a single NLF cultural drama program provides the audience with information, instruction, and entertainment, all designed to persuade the target to adopt the political and social viewpoints of the NLF. Hence, it is again emphasized that PSYOP, especially in an insurgency environment, such as that in Vietnam in the 1960s, should integrate all functions of communication in an unmistakably coordinated PSYOP program.

THE COMMUNICATION PROCESS

All human communication must take place in the framework of social relations. The importance of understanding interpersonal relationships as an essential part of the communication process and the need for a clear vision of social pressures as part of the total communication process was emphasized previously. Joseph T. Klapper, Director of Social Research for the Columbia Broadcasting System, provides considerable evidence to support the thesis that effective persuasive communication must relate to the total social situation and that mass media are "not so terribly powerful" in persuasive communication. Specifically, Dr. Klapper writes:

More recent studies, both in the laboratory and the social world, documented the influence of a host of other variables [in persuasive communication] including various aspects of contextual organization; the audience's image of the sources; the simple passage of time; the group orientation of the audience member and the degree to which he values group membership; the activity of opinion leaders; the *social aspects of the situation during and after exposure to the media*, and the degree to which the audience member is forced to play a role; the personality pattern of the audience member, his social class, and the level of his frustrations; the nature of the media in a free enterprise system; and the availability of social

mechanisms for implementing action drives. The list, if not endless, is at least overwhelming and it continues to grow ^{9*} (emphasis added).

Communication Situation

The communication situation is one of the social factors that affects persuasive communication in that generally what people say and how they react to a PSYOP message depends on where they are, who is listening, and what communication channel is being used. P.J. Deutschmann has classified the communication situation as private communication and public (mass) communication.¹⁰ He lists face-to-face conversation as one type of private communication; another category would be what he has labeled "interposed" (private communications such as a letter or a telephone call).

It is apparent that in private communication one tends to be less formal and use different signs, words, and symbols. For example, members of the Armed Propaganda Teams (APT) (Viet Cong who have rallied to the GVN) frequently employ private communications to get the "Chieu Hoi message" to the families of known Viet Cong. The teams speak with the authority of experience; they are convincing; they have the personal answers to questions likely to be asked, and by their presence give proof that the Chieu Hoi Program delivers its promises. Furthermore, they can sincerely portray their inner feelings about their decision to defect from the ranks of the Viet Cong.

Mass media communication channels can be face-to-face and public (mass meetings, cultural drama performances, movies, or opera) or private (the individual as a radio or television viewer, or reading a magazine, book, or leaflet). The significant point is that the communication situation determines to some extent the kind of communication that goes on and the response that is likely to be made to it. For example, many techniques used to stimulate enthusiasm at a public rally would not be appropriately used in an individual, private environment. It is unlikely that a person listening to a radio in private would develop crowd excitement and its consequent behavior. Moreover, a person would not communicate with a stranger in the same manner as he would with a member of his immediate family group, nor would he communicate with a trusted friend in the same manner as with a government official.

A variety of communication techniques can be used to combine private and public communication. For example, a duplicate of a public poster can be prepared as a small handout or leaflet, thus permitting the individual to discuss the poster in public and at the same time carry the message home to discuss it with members of his family. The leaflet reinforces the government message and gives additional meaning to the public poster. Also, the handout or leaflet tends to set in motion a functional communication group to discuss the poster for the second time (after the PSYOP cadre departs) in public.

Influence of the Group

Four intervening variables in the communication processes have been stated in the literature as: first, the exposure to the media; next, the differential character of the various media; third, the existing attitude or attitudes of the individuals; and finally, the content of the message.¹¹ On the basis of many communication studies, Katz and Lazarsfeld have shown that a fifth variable should be added. They conclude that the response of the individual to communication cannot be accounted for without reference to his social environment and to the character of his interpersonal relationships.

The focus of this section is on the primary group to which an individual belongs—his family, friends, informal work teams, small military units—and the more formal groups such as farmers' organizations, youth groups, defense groups, and so forth.¹² Katz explains that within these groups the members are mutually attracted to each other as personalities. Such groups are usually characterized by their small size, relative durability, informality, and face-to-face contact.¹³

The influence of the group on communication is profoundly important to PSYOP; yet, for the most part, there is a tendency in U.S.-sponsored PSYOP programs to direct communication to the individual as an isolated entity of society rather than to the individual as an integral part of an active social environment. That being the case, many PSYOP intelligence- and information-gathering programs tend to organize the collection of data as if each member of the target audience is isolated and in a sterile environment. Man's social attachments are significant; consequently, the opinions and activities shared with a group influence his response to all communication. In other words, interpersonal relationships must be taken into account to understand properly the communication process, and to conduct effective PSYOP programs. Katz states that interpersonal relationships seem to be anchorage points for individual opinions, attitudes, habits, and values."¹⁴

This concept (the influence of the group) suggests that when people are interacting in the communication process, they generate and maintain common ideas and behavior patterns which they are reluctant to give up or to modify by themselves. Also, it is apparent that when communication concerns sensitive roles and standards of the group, the communication is usually checked with other members of the group. In this respect, two important communication concepts for PSYOP are (1) the two-step flow of communication; and (2) the reinforcement function.¹⁵

Two-Step Flow of Communication

Considerable research has shown that the image of the simple, direct effect of the mass media is an oversimplification. The closer one observes the workings of the mass media, the more one realizes that their effects depend on a complex network of specialized personal and social influences. It appears that the mass media as such have marginal effect in persuasive communication about political or social programs. For PSYOP

this means that: (1) interpersonal communication significantly counteracts or reinforces messages transmitted by a source, and that (2) influence spreads gradually in a group via various combinations of mass media and interpersonal networks. A series of studies has demonstrated that communication frequently flows from the various media, reaching first selected opinion leaders (or key communicators) and then, in turn, less active members of a group. Specifically, there could be and usually is a filter, or intervening factor, between the stimulus (the PSYOP message) and the resultant opinions, decisions, or actions of the group. This is what is meant by the two-step flow of communication. Some research has shown that even if there is direct communication, people will go to the key communicator for an interpretation or comment, which acts as a form of filter in the communication process. Katz has commented that it is a result of investigations dealing with the role of the opinion leader that communication research has joined those fields of social research which have rediscovered the primary group.¹⁶

These studies, many of them products of the Bureau of Applied Social Research at Columbia University, found: first, that the influence of other people on specific decisions tends to be more frequent (and certainly more effective) than the influence of the mass media; second, that people are influenced most by their close associates and those who are of the same socioeconomic status; third, that intimate associates tend to hold opinions and attitudes in common and are reluctant to depart unilaterally from the group consensus even when a mass media appeal seems attractive; and finally, that opinion leaders tend to be more exposed to mass media than other members of the group.

Reinforcement Function

It has been stressed that an individual's response to persuasive communication is based on and reinforced by his regular interpersonal relationships. In all societies a normal person usually consults a member of this primary group before taking decisive action in response to persuasive messages. In other words, the tendency is to have a close friend or a relative reinforce his attitude toward the subject contained in the PSYOP message. For example, a great number of the Viet Cong rally to the government of Vietnam's Chieu Hoi Program through an intermediary who is a relative or trusted friend. Many do not defect until they receive assurance from a relative or friend that the government of Vietnam will keep its promises concerning good treatment and other aspects of the amnesty program.

A form of reinforcement (in reverse) is this technique used by the Viet Cong cadres in their attempt to deter defection. To illustrate—a Viet Cong or North Vietnamese army soldier claims to his comrades that he was captured by the GVN or the U.S. forces and that he had subsequently escaped. He then testified that while a prisoner he was treated badly and that he had firsthand knowledge that the government of Vietnam did not abide by their good treatment policy.

The research findings on reinforcement substantiate the fact that inti-

mate associates tend to hold opinions and attitudes in common and are reluctant to depart unilaterally from their group consensus. The importance of face-to-face communication (as a reinforcement function) was stated by a district chief to his American advisor as follows: "Americans have much but no talk. VC no have much, but have talk, talk, talk. We must talk."¹⁷

Society and the Communication Framework

The norms and constraints of the society as a whole also affect the communication framework. In any society there are things one usually does and things one simply does not do; things one generally believes without challenge and ideas one generally does not entertain because of the society that one has grown up in. Consequently, some ideas and traditions can be challenged, others not. Society determines how, why, to and from whom, and with what effects communication occurs.

For example, the central objective of communication for Communist China is to mobilize the entire Chinese population in support of Communist policy. For them, the appeal is all-embracing, addressing itself to the whole person. Every aspect of the society is concerned with the objective, including the social institutions, such as schools and membership associations.¹⁸

The political regime relies on the radio-loudspeaker system to promulgate new directives, to encourage the study of Mao Tse-tung's works, and to stimulate revolutionary enthusiasm generally. In Peking, for instance, the day begins at 5:30 a.m. with neighborhood loudspeakers pouring forth the music, "The East is Red." This is usually followed by the reading of one of Mao's sayings. Various methods have been used to increase the size of radio-listening audiences. One method is an organized effort to promote collective listening; another method is the use of radio-diffusion exchanges or wired-radio speakers. With regard to wired radio, Franklin Houn writes:

The Chinese Communists feel, on the basis of their experience, that radio-diffusion exchanges are valuable instruments of agitation for higher labor productivity, and of socialist education among workers and peasants, including the news distribution on national and international affairs. They also see its great value in transmitting and explaining policies and decrees of the party and government, disseminating scientific knowledge and guidance on sanitation, giving weather reports, enriching the cultural life of the nation, and mobilizing the population to undertake emergency works.¹⁹

In addition to radio, Communist China, in its efforts to reach the total society, has stressed the habit of reading. One effective method is to supplement printed newspapers with mimeographed newspapers, handwritten wall newspapers, and countless blackboard newspapers in small villages and settlements, factories, schools, public organizations, cooperative farms, and company-size units of the army.

Response of the Entire Personality

Schramm says that meaning comes not merely from a dictionary definition; it has factual, emotional, connotative, and denotative content. It is the response of the entire personality to a set of signs, and a person learns these responses in a social, not a sterile environment.²⁰ Consequently, a

person's experience with the symbols and their referents is the only meaning that anyone can read into a message. As an example, the motion-picture cartoon showing Donald Duck as a soldier had a denotative meaning rather than the intended connotative meaning to the Africans who viewed this kind of presentation for the first time. In a similar way, any effort to explain the abstract principles of representative democracy to a politically unsophisticated target can be a frustrating experience. Certainly, the meaning that two people perceive in a message depends on finding an area in which the experience of the two individuals is sufficiently similar so that they can share the same signs efficiently.

Therefore, if PSYOP programs are to have meaning, the first requirement is to understand that the source and the receiver must find an area where their experiences are sufficiently similar so that they can communicate (share the same signs efficiently). Schramm uses the term "frames of reference" to explain the concept that two people can communicate efficiently only in those areas where they have a common fund of experience. He says:

The sources can encode, and the destination can decode, only in terms of the experience each has had. If we never learned any Russian, we can neither code nor decode in that language. If an African tribesman has never seen or heard of an airplane, he can only decode the sight of an airplane in terms of whatever experience he has had. The plane may seem to him to be a bird, and the aviator a god borne on wings.*²¹

The concept of frames of reference can be visually portrayed by two circles. If circles around A and around B are considered as their frames of reference, then the areas wherein they can communicate efficiently with each other are represented by the overlap of the two circles. If the circles do not meet because they have no common experience, then communication is impossible. If the circles have only a small area in common, then it is going to be difficult to get the intended meaning across from one to the other. It is suggested that one difficulty experienced by sophisticated urban Vietnamese, in attempting to communicate with rural audiences, is that there is no overlap of their frames of reference. In other words, a significant problem in intercultural communication is finding the area where the experiences of the communicator and the receiver are similar.

Also it is important from a PSYOP viewpoint to understand that the VC soldier who picks up a leaflet or listens to a PSYOP radio broadcast not only brings to the message his language but certain beliefs and values, some lightly held and others he is prepared to defend stubbornly against change; and certain loyalties to persons and groups—these include a sense of the kind of behavior that is expected of him as a member of those groups, and a keen sense of the possible social consequences of going against the norms. If he decides that the PSYOP message is interesting and promising enough, he selects some or all of the cues it offers, interprets them according to his frame of reference, and disposes of them according to his needs, his values, and the social imperatives and

*Reprinted with permission of the University of Illinois Press, copyright holder.

the constraints he feels. To cite one obvious example, if a PSYOP leaflet (directed to a VC soldier) contains information about a GVN victory over an unknown VC unit in a distant province, it will be of little interest. On the other hand, if the leaflet presents facts and meaningful data about his own unit, if it provides names of people that he knows, and if it has a picture of a friend that he recognizes, it is highly probable that the message will have meaning and the frames of reference will overlap.

Concept of Total Transmission

The decisive step in the communication process is to "transmit" or deliver the message to the intended audience by an appropriate channel. The use of the term "transmit" in this context involves more than the physical dissemination of leaflets or the delivery of audio messages. It is a four-step "total transmission" process in that: first, the message must attract attention; second, it has to be selected; third, it has to be interpreted; and fourth, it should be used at least in part as intended by the source. This "total" process generally applies to all communication, whether the purpose is to inform, to instruct, to entertain, or to persuade. The first three elements of the process will be discussed in this section and the fourth in a subsequent section on Relation to Purpose.

The critical step in the communication process is, of course, to attract attention, so that the message will be given consideration by the audience. All sorts of gimmicks and devices are used to attract attention with the hope that a particular item will be selected for consideration. The newspaper headline, the flashy photograph, the fancy cover on a novel, the display outside of an auditorium, the attractive young lady in a television commercial—all are intended to attract attention. In operations in Vietnam, messages are placed on attractive calendars, put on soap, kites, and numerous utility items such as plastic shopping bags and wash-basins.

The next step is to get the audience to read or listen to the message. Reading or listening takes energy, and, generally, man operates to conserve his energy. The more energy required to make a response, the less likely it is that response will be made—other things being equal. David Berlo states that when the decision is made to perform or not perform a given communication behavior, it is based on the relationship between the amount of reward and the amount of energy required.²²

It is suggested that the reason the safe-conduct pass scores highly as a selected item among enemy soldiers is the expectation of much reward for little effort. For one thing, this PSYOP message is usually direct and brief. Moreover, the safe-conduct leaflet is usually interpreted by the enemy soldier as additional insurance (it could save his life), so the reward is high.

Schramm notes that many times people select things accidentally or on impulse. Much is the result of role patterns or habits learned from

obscure experiences. Yet over the years people tend to seek the kinds of communication that have rewarded them in the past. Furthermore, people tend to develop considerable loyalty to their favorite magazine, radio station, opera, Broadway show, television program, or trusted friend.

Berlo writes that Schramm's concept can be expanded to include more than the selection of a message.²³ Basically, he notes, we react to those things that are worth the effort and make decisions accordingly. He defines the fraction of decision as:

$$\frac{\text{Expected reward}}{\text{Expected energy required}} *$$

After the selection of an item of communication, the next step is acceptance. This depends largely on what Schramm terms the "face validity" of the message, and on the reader's judgment (interpretation) of the originator's credibility. Carl Hovland, Irving Janis, and Harold Kelly note that the credibility of a message depends on two factors. In their words:

... a recipient may believe that a communicator is capable of transmitting valid statements, but still be inclined to reject the communication if he suspects the communicator is motivated to make nonvalid assertions. It seems necessary, therefore, to make a distinction between (1) the extent to which a communicator is perceived to be a source of valid assertions (his expertness) and (2) the degree of confidence in the communicator's intent to communicate the assertions he considers most valid (his "trustworthiness"). In any given case the weight given a communicator's assertions by his audience will depend upon both these factors, and this resultant value can be referred to as the "credibility" of the communicator.*²⁴

Many people regard the radio as more credible than the newspaper; others have the opposite opinion. A great number of studies confirm that attitudes toward the source to which information and news are credited are likely to affect the acceptance of a message. The very large number of studies which fall under the heading of "prestige suggestion" bear on this problem.²⁵

As one example, an NVA sergeant stated that he was strongly influenced to defect by a GVN leaflet in the form of a testimonial from a former comrade. The PSYOP message contained three points: first, it related how this NVA soldier was wounded during a specific action and was left on the battlefield for three days; second, the message explained that the wounded soldier was "rescued" by the South Vietnamese army and immediately sent to a hospital; and third, the testimonial emphasized that as a prisoner of war the soldier was receiving good treatment. The NVA sergeant went on to explain that he was able to relate the information in the leaflet to the source (a former comrade) and with the actual

*Reprinted from David K. Berlo, *The Process of Communication: An Introduction to Theory and Practice*, 1960, with the permission of Holt, Rinehart and Winston, Inc., copyright holder.

*Reprinted from Carl I. Hovland, Irving L. Janis, and Harold H. Kelly, *Communication and Persuasion: Psychological Studies of Opinion Change*, 1953, with the permission of Yale University Press, copyright holder.

battle, and it was accurate. At this point he began to doubt the information given him by the VC cadre about the cruel treatment of prisoners.²⁶

In a similar manner, statements from high-ranking or prestigious VC or NVA defectors (Hoi Chanh) attract attention and add credibility to messages. One rallier declared that a message from a former VC colonel cast doubt on the credibility of their cadres. The troops asked, "Why should such a high-ranking individual leave the Front and urge his comrades to defect?" A former member of the Viet Cong stated, "I believed the Colonel and I decided to rally." Many Hoi Chanh stated that messages from defectors who were senior party members upset their frame of reference and values.

A significant number of Hoi Chanh emphasized that they judged truth (credibility) in a variety of ways. They considered what they had been told by the cadres and other sources; or they would make a judgment as to how much of this information they actually believed; or, they could consider what information they received from interpersonal relationships (or what they heard); and, finally, what they actually had seen for themselves.²⁷

The NLF understand that communication is likely to be rejected when the credibility of the source is questioned. Therefore, they make a determined effort to ensure that their agitprop cadres are expert and have the confidence of the people. In fact, the ideal cadre is a model of dedication, sobriety, and skillfulness.²⁸ He is concerned with not only the techniques of communication but also with substance. Obviously, from the above discussion, any systems approach to audience analysis for PSYOP programs must consider the four elements of the "total transmission" process. First, Does the message attract attention? Second, Is it being accepted and does its source have credibility? Third, Is the message being understood as desired by the source? And finally, With what effect?

Relation to Purpose

The effect of communication is directly related to its purpose. If the purpose is to provide "pure" news or information and this is accepted by the reader, viewer, or listener, then the communication has had effect. Furthermore, if the purpose is to instruct or educate and the student does well, it is assumed the instructor communicated effectively. If an audience usually responds favorably to an entertainer, then his popularity and success are assured.

Persuasion

Persuasion, especially in support of military operations, requires a planned program of communication to fit the social environment. Furthermore, it is presumptuous and boastful to believe that persuasion can be accomplished with a single message; it requires, as already emphasized, maximum integration of communication media, both mass media and face-to-face communication. It needs one other vital element—an institution; that is, an organization and managers who understand the communication process and the role of media in programmed communication. Effective persuasive communication cannot be random in nature.

In order to persuade, the communication must activate certain psychological dynamics that are related to the individual's perception of his social environment, his needs, his social relationships, and his beliefs and attitudes. To accomplish any substantial change in attitude, persuasive communication must bring about a psychological process in the receiver. Both it and informative communication must get through, but for persuasion it is not enough to bring about a psychological process in the receiver; it is necessary to set in motion the particular dynamics by which the receiver will, in effect, change himself. This is the essential difference between persuading and informing.

In military PSYOP programs, the receiver in a hostile area looks at a hard persuasive message as "another piece of propaganda from the enemy." He comes to it with his defenses up and he is prepared to be skeptical; he asks, What is there for me in the message? He comes to the message with a set of personal relationships and loyalties, and he feels deeply dependent on many of them. He comes with a set of perceptions in regard to his future role in his environment, and he is not prepared to change without good reason. Thus, persuasion requires much skill, patience, and a great deal of current knowledge about the individual (target) and his social environment.

Techniques of Persuasion

Numerous studies and investigations deal with techniques used in persuasion communication. Arthur Cohen writes that the validity of many persuasive techniques has long been argued by propagandists, educators, and public speakers.²⁹ He asks four cogent questions about such techniques. First, What role does the organization of the arguments play in the effectiveness of a persuasive appeal? Is it more effective to present one side of an issue or to present both sides? Second, Should the conclusion be stated conspicuously in a persuasive communication, or should the reader draw his own conclusion? Third, When a single side is presented, should the strongest argument be used first or at the end? When two sides of an issue are presented, which side should be presented first? Fourth, In a persuasive message, what type of appeal is most effective in stimulating an individual or group to accept a message? For example, What is the effect of fear-arousing propaganda? Of sentimental messages? Of using an ambiguous source? Of using rational appeals? We do not have the answers to many of these questions, especially as they are related to foreign cultures and societies. The above questions are important in a systematic framework for PSYOP, and the answers will be different for the various cultures and subcultures of a society.

An example of a persuasive leaflet message that did not have the desired effect is one disseminated to VC soldiers that stated, "If you do not rally immediately, we will kill you to the last man. We really don't care whether you rally or not; we are quite willing to accomodate your desire for death by killing you."³⁰ Usually the reaction to such a message is one of anger and a stiffening of the soldiers' will to fight.

Many NVA and VC prisoners assert that messages emphasizing hardships, such as lack of food and medical treatment, are not effective because they always expected to face such hardships. In the words of one Communist soldier, "Hardships are the lot of the revolutionary soldier and the natural thing; only the weak and cowardly are influenced by such enemy propaganda." On the other hand, the less dedicated, and especially the younger soldiers, suggest that the truth be told them about the hardships, in particular the lack of medicine. One high-ranking VC defector is of the opinion that sentimental and nostalgic PSYOP messages are of no value, and he emphasizes that persuasive messages should be factual and to the point.³¹ Yet, numerous other VC soldiers repeatedly state that emotion-provoking poems and nostalgic letters are the most effective of the PSYOP messages. The transmission of emotionally persuasive messages to the civilian population "exploiting" VC atrocities is another example of the uncertainty concerning emotional appeals. For the most part, such messages proved to be counterproductive. From the viewpoint of the source, the purpose was to "persuade" the civilian population that the Viet Cong were evil and had no regard for the people or their property. Many such messages, however, only served to increase tension and fear, so that in some cases the PSYOP message tended to reinforce the NLF in its program to obtain cooperation from the people.

It should be noted that two diverse examples have been presented dealing with the use of fear-arousal or imminent threatening messages—one to a military and the other to a civilian audience. The use of the imminent threat or fear-arousal message to the military audience did not have the desired effect. It is suggested that the reasons are: first, the esprit of the primary military group; and second, the fact that military training and indoctrination tend to build resistance to fear-arousal messages. On the other hand, the VC use of terror and threat-arousal techniques on civilians has, in many instances, had the desired effect. This can be attributed to several circumstances: first is the fact that the average civilian group is less organized and disciplined than the military (It is interesting to note that in those areas of Vietnam dominated by militant religious organizations, the use of fear arousal by the Viet Cong has not, generally, been effective), and second, the use of fear-arousal techniques has been effective in those areas where the presence of the VC infrastructure is known and the use of the "carrot" and "stick" approach (by the Viet Cong) is prevalent.

It is obvious that additional research is needed concerning the use of persuasive appeals in support of PSYOP programs, especially in an insurgency environment. Therefore, determining valid persuasive communication techniques that are applicable to an insurgency environment is an important essential element of information (EEI) for PSYOP programs.

The Role of Interpersonal Persuasive Communication

Overwhelming evidence indicates that in persuasive communication, face-to-face contacts were among the most important influences stimulat-

ing opinion change. The investigation by Paul Lazarsfeld et al. in *The People's Choice* disclosed that radio, newspapers, leaflets, and other mass media had only a slight influence on voting; what influenced people most was other people—friends, family, community contacts. As already noted, it was shown that ideas flow from television, radio, and newspaper first to opinion leaders, and from them to the less active elements of the group. Lazarsfeld emphasizes that this was a surprise to those who considered the mass media as omnipotent.³²

Joseph Klapper supports this viewpoint when he writes that “mass communication ordinarily does not serve as a necessary and sufficient cause of audience effects, but rather functions among and through a nexus of mediating factors and influences.”* He notes that on those occasions where the mass media influence change, one of two conditions is likely to exist. Either the mediating factors will be found to be direct; or the mediating factors, which normally favor reinforcement, will be found to be themselves impelling toward change.³³ As stated above, Katz and Lazarsfeld also conclude that personal influence is the most important in persuasive communication.

The Communist movement clearly stresses the importance of interpersonal persuasive communication when it urges the cadres to “mingle with the people as water is mixed with flour to bring about a consistent rising.” Pike writes that the NLF clearly understood what all knowledgeable communicators know:

that the simple communication of facts is often ineffectual in changing men's opinions, [that] majority opinion reinforced by social pressure counts for much more than expert opinion or leadership assertions, and [that] people tend to misinterpret what they hear or read to suit their own preconceptions.³³ (Emphasis added.)

Hence, the VC and NLF units emphasize that, if the revolution is to succeed, units everywhere must launch PSYOP programs and motivate the people to take part “in the revolutionary task and realize the Party's policy line.” A political directive from an NVA division in II Corps stated that, “In civilian proselytizing, in addition to the task of helping the people to improve and stabilize their lives, we must attach importance to propaganda in order to create a revolutionary influence among the masses.” Numerous VC documents stress the importance of interpersonal communication between the soldier, cadres, and civilian population; mass media, for the most part, are of secondary importance to the VC.

A COMMUNICATION MODEL

To recapitulate, every communication situation differs in some ways from every other one. An attempt will be made in closing to isolate certain elements that all communication systems have in common. In any case, one should constantly remember that this brief discussion is incomplete, in that this short section cannot possibly list all of the ingredients of the communication process nor adequately discuss how they affect each

* Reprinted with permission of the Free Press. Copyright © 1960 by the Free Press, a corporation.

other. The purpose of this last part, then, is to provide the basic ingredients of a communication model and stress the dynamic nature of the process.

Basic Elements

Communication models contain three fundamental elements: the person who speaks or writes; the speech, illustration, or written material produced; and the person who listens or reads.

Institutional Model

All communication must have some source. This can be a person or group of persons (such as an institution) with a purpose. The fundamental purpose of a PSYOP organization, as an institution, is to: (a) code (write or design messages), (b) transmit messages, and (c) influence the audience as intended by the source. The communication encoders (writers, designers, and artists) are responsible for taking the ideas or the guidance from the institution and putting them in a code (language) expressing the source's purpose of PSYOP objectives. It is important to understand that the encoders are not separate entities of the model; they are extensions of the source. (See figure below.)

Since PSYOP programs are always conducted through an institutional base, it is obvious that the individual encoders (B¹) through (B⁵) in the figure below are not free agents; the language of the messages, the illustrations, and the channels (D¹) through (D⁵) are determined by the institution. This complicates the communication process and makes it vulnerable to error. There is likely to be filtering and distortion at any stage. Wilbur Schramm expresses the chances for error in this way:

. . . if the source does not have adequate or clear information; if the message is not encoded fully, accurately, effectively in transmittable signs; if these are not transmitted fast enough and accurately enough, despite interference and competition, to the desired receiver; if the message is not decoded in a pattern that corresponds to the encoding; and finally, if the destination is unable to handle the decoded message so as to produce the desired response—then, obviously, the system is working at less than top efficiency. When we realize that all these steps must be accomplished with relatively high efficiency if any communication is to be successful, the everyday act of explaining something to a stranger, or writing a letter, seems a minor miracle.^{*37}

An important requirement of any communication system is that the receiver (E) of the message, and the encoder (B) must be in tune. This is easy to see when communication is considered from a mechanical viewpoint—obviously, if an audience is expected to hear a radio broadcast they must have radio receivers and be tuned to the proper frequency or channel. However, mechanical instruments and devices do not themselves really communicate. “Being in tune” with the audience requires people, and people who understand communication techniques, attitudes, and other people who may be different from themselves. Therefore, communication involves more than language skills; it requires a great deal of knowledge and insight. Most of the communication process occurs in what Schramm refers to as the “black box” of the central nervous

*Reprinted from Wilbur Schramm, “How Communication Works,” *The Process and Effects of Mass Communications*, ed. Wilbur Schramm, 1955, with the permission of the University of Illinois Press, copyright holder.

A Communication Model.

system, the contents of which we understand only vaguely. Schramm emphasizes that "we are therefore dealing with analogies and gross functions, and the test of any model . . . is whether it enables us to make predictions—not whether it is a true copy of what happens in the 'black box'—a matter of which we cannot speak with any great confidence."³⁸

In summary, clearly some PSYOP encompasses more than loudspeaker and leaflet operations. PSYOP and communication involve the entire population, and from a communication viewpoint, the environment is complex—targets are varied and seldom clear cut. Consequently, the scope of communication programs is extensive, many channels are used, and a variety of techniques, including the full spectrum of communication procedures, are programmed.

To gauge the effect of PSYOP programs, it is necessary to consider the objectives and performance of political, social, or economic programs being supported. If the primary programs are seriously deficient and these deficiencies are understood by the people, no amount of PSYOP will persuade the people that the programs are worth while. Therefore, the effect of persuasive communication is highly dependent on a variety of factors including PSYOP policy itself, credibility, the channel and techniques used, and the role of group dynamics.

PSYOP

WHAT IS IT* **

BY RAYMOND J. BARRETT

Efforts to delineate the concept of psychological operations have been impeded by a reluctance to acknowledge PSYOP as an instrument of strategy.

What is a psychological operation? Is there a psychological aspect to our national security policies and programs? Is there another dimension

*Excerpts from "PSYOP: What Is It? And What We Should Do About it." *Military Review*, LII, no. 3 (March 1972), pp. 57-72.

**The views expressed in this article are the author's and do not necessarily reflect those of the State or Defense Departments. Statement by Editor of *Military Review*.

to our efforts other than the direct impact of our diplomatic, military, and economic activities?

Clearly, the results we achieve do not depend simply on what we do. They also depend on how others perceive our actions. The views of others frequently determine whether they act in ways beneficial or detrimental to the U.S. national security goals we seek through our diplomatic, military, and economic activities.

Thus, there clearly is a psychological aspect to our national security policies and programs. Often, it is the critical element in whether we are successful or not. Psychological operations (PSYOP) respond to this aspect of our national security efforts; they are designed to get others to respond in ways beneficial to achieving our goals.

COLD WAR

The development of the cold war illustrates the reality and importance of psychological considerations. The confrontation between the West and the Soviet Union stemmed from many things. But clearly, a critical factor was how each side viewed the other's actions. The Soviets, having suffered two devastating attacks in 25 years, were intent on absolute security in Eastern Europe. They perceived Western attitudes toward Eastern Europe as being incompatible with this overriding Soviet concern. The United States and Western Europe saw Soviet statements and actions as implacably hostile, aggressively expansionistic, and a direct threat to their very existence.

These perceptions motivated the diplomatic, military, and economic actions of both the Soviets and the West. The pattern of action and reaction multiplied each side's perceptions of the other in ways that steadily deepened the confrontation.

Another salient feature of the cold war has been the role of ideology. The Communists brought to postwar prominence a way of thinking attuned to psychological considerations. The Communist sees the world in an ideological framework. The way the thought of Mao Tse-tung has dominated China's conduct is a salutary reminder of the absorbing concern of the Communist mind with ideology.

Communist China now distributes publications abroad in some 40 languages and broadcasts about 1,500 hours a week in 38 different languages. In the Soviet Union, Tass sends out 75,000 words a day, and foreign broadcasts total over 1,000 hours a week in 40 languages. The volume of these efforts indicates graphically the attention devoted by the Communists to psychological considerations.

A LIVING HERITAGE

Soviet and Chinese ideological and psychological activities often sound like massive polemics of questionable sincerity. However, ideology has real meaning for Communists. Marxist-Leninist ideology is a living heritage. It assures Communists they are right in trying to extend their sway over the rest of the world, and it tells them they will win. The latter conviction also endows their efforts with a patience that contrasts with US impatience for results.

The theoretical certainty of their ideological goals allows Communists to be flexible about means. They can play on the contradictions that bother others without regard to their own complete consistency. An ideological approach also highlights concern for "ideas." This is obviously a frame of mind adapted to identifying and exploiting the psychological aspects of international developments.

Americans, too, approach human behavior and international events from their own conceptual point of view. But the central and explicit Communist concern for ideology has so broadened and deepened the psychological aspect of international relations as to give it a new dimension. The Communist approach to the world incorporates a pervasive effort to foster social climates and public opinion that will affect domestic and international policies in the Communist interests. These Communist activities have often had a direct impact on our diplomatic, military, and economic capabilities. Hostile psychological operations can drive out good deeds.

U.S. REPUTATION

In this connection, it is instructive to examine candidly the deterioration of the reputation of the United States. Why has the Soviet Union maintained a relatively favorable image? Why have the rapes of Hungary, Tibet, and Czechoslovakia made little lasting impression? How could a society that must build a wall to retain its members be attractive to the peoples of the world seeking freedom? In contrast, why has worldwide obloquy attached to the US efforts in Vietnam?

It is no accident that words like "intervention," "imperialism," "exploitation," and "fallout" have become common currency and loaded with unfavorable connotations. Similarly, "peaceful coexistence" and "wars of national liberation" have become acceptable concepts with desirable aspects. In contrast, the words "capitalism" and "capitalist" have been all but universally tainted as involving social injustice and the "exploitation" of man by man.

"Socialism" has become a "good" word, and the Communist countries label themselves "the Socialist Camp" and dedicate their efforts to "Socialist fraternity." Simply labeling a relationship "colonialist" or "neocolonialist" creates a stigma and puts it on the defensive. Soldiers fighting for the government in the Congo became "mercenaries," a derogatory word. On the other hand, the revolutionaries in the Dominican Republic were labeled "constitutionalists," a "good" sounding word.

The United States had a highly favorable image at the end of World War II, and it has given others vast aid and made many sacrifices. Yet the United States is in disrepute in much of the world. In contrast, the Soviet Union has repressed dissent by force, proclaimed a dogmatic ideology, and given far less aid than the United States and several other countries. Yet the Soviet Union has a great deal of sympathy and support in many quarters of the world. How has this come about?

IMAGE OF POWER

Power—or, more exactly, the image of power—has been an important

element. Soviet nuclear power has obviously affected the views of others. The Soviets have adroitly projected an image of power. They have not hesitated, for instance, to dwell on the terrors of nuclear warfare. The Soviet threat is credible enough that they can utilize it to heighten fears of the USSR in many segments of world opinion.

These fears lead to worry about "provoking" the Soviets. "You cannot expect the Soviets to be reasonable if you keep provoking them" runs the plaint. The result is unremitting pressure on the United States to make concessions. We are placed constantly on the defensive, and the United States incurs opprobrium if it does not make repeated, unilateral concessions.

The Communists have shrewdly used their concepts to exploit the aspirations of the developing world. Those struggling to achieve or develop independence were not receptive to the idea of taking control of their destinies gradually. More important to them than advice and assistance are pride and sense of self-realization. In an atmosphere of both poverty and aspirations, the idea of pitting one person against another seems destructive. The concept of working together for the common good seems highly desirable—and translates readily to sympathy for things labeled Socialist.

These attitudes obviously offered a fertile field for Communist psychological exploitation. Admittedly, the Communist could be more freewheeling because they had few direct interests that might be damaged. But they were also astute in playing up to the concerns of the newly independent countries. Delegations from these lands were freely brought to Moscow and Peking, and key Chinese officials, in particular, paid them flattering attention. China diligently portrayed itself as the model for, and friend of, revolution in the Afro-Asian world. Through skillful activities and constant repetition, Communist tenets have been given vague but wide acceptance by many peoples and governments throughout the world.

The United States also had tremendous assets that would seem to have offered it far greater opportunities than the Communists enjoyed for achieving identification with those seeking independence. The United States was the modern model of national independence from a colonial empire. It articulated the ideals of life, liberty and the pursuit of happiness.

UNITY AND DIGNITY

American history, for all its faults, centered around the pursuit of unity and dignity out of diversity. American society and economy, for all their serious defects, offered a quality of life well beyond that achieved previously. The United States accepted the principle of national traditions in a pluralistic world while the Communists, as the Brezhnev doctrine made blatantly clear, had one doctrinal concept for all the world. Yet, despite these seeming advantages, the climate of opinion has clearly changed against the United States and has imposed important practical constraints on what we can do in the world.

In the current era of insurgency and potential or actual instability, psychological considerations are the central element. Public attitudes toward government and violence are crucial. Vietnam has made clear that governmental legitimacy and security stem from a state of mind as much as a set of physical factors.

Psychology is similarly crucial to the success of the Nixon doctrine. The framework of U.S. security is our network of multilateral and bilateral defense treaties. Clearly, the viability of this arrangement depends on continued rapport and confidence. Successful partnership is in many ways, a frame of mind.

Under the Nixon doctrine, we are essentially engaged in developing the self-confidence of our allies. This effort involves our allies' perceptions of their problems and capabilities and of their neighbors and of us. The success of the Nixon doctrine also involves how our allies' neighbors, particularly those who might threaten them, view our capabilities and resolve, as well as those of our allies. All of these elements are heavily psychological.

ERA OF NEGOTIATION

The era of negotiation that the United States seeks has similarly important psychological aspects. The willingness to negotiate is also a frame of mind. President Richard M. Nixon has referred to the need for a spirit of negotiation in which each side defines its interest with concern for the legitimate interests of others. At the same time, a productive spirit of negotiation must stem from a position of confidence and not of weakness. Clearly, all of these actions are heavily underscored with psychological implications. Serious negotiation is more than atmospherics. It comes down to specific steps. A central factor in maintaining our troop levels in Europe was the destabilizing effect a cut might have on the Soviet evaluation of the American will and commitment to the North Atlantic Treaty Organization. An important element in proceeding with the *Safeguard* antiballistic missile system has been the belief that it would motivate the Soviets to negotiate more productively at the Strategic Arms Limitation Talks.

Deterrence itself is, in the main, based on psychology. Deterrence relies on influencing the thoughts, perceptions, and actions of potential foes in ways that will discourage or prevent them from acting in a manner inimical to our security.

We can also point to examples in which the United States used psychological considerations adroitly and realized clear benefits. One was the "atoms for peace" program in 1953. This program offered a practical way to provide nuclear fuels to third countries for peaceful purposes. It also created a favorable impression for the United States among those countries eager to gain access to nuclear power as a key step toward self-development. And, at the same time, it embarrassed the Soviet Union by highlighting its reluctance to engage in a similar program.

OPEN SKY PROPOSAL

Another example was the "open sky" proposal that President Dwight D. Eisenhower made at the Geneva Summit Conference in 1955. The concept was forthright and clear. Each country would allow complete freedom to inspect its territory from the air.

This approach offered a realistic way to put aside many of the worries and uncertainties that led to fear of a surprise nuclear attack. The move clearly illuminated the Soviet reluctance to accept any form of verification which would be essential to meaningful strategic arms agreement. The proposal offered dramatic evidence that the United States was willing to cooperate toward arms control despite its strategic dominance. It completely changed the atmosphere of the summit conference and of world public opinion in ways favorable to the United States.

A more recent example of psychological benefits for the United States arises from our landings on the moon. Obviously, these explorations have caught the interest of most of the world. The worldwide anxiety during *Apollo 13's* near tragedy underscored the tremendous empathy of the astronauts and our space program. This human concern and interest have comprised a singular asset for the United States that has helped counterbalance the opprobrium that Vietnam has produced.

KEY FOREIGN GROUPS

This review of the reality and importance of psychological considerations in international relations points the way toward defining psychological operations. The key point, clearly, is how pertinent foreign groups perceive actions that are important to US national security. What we want, therefore, are responses by key foreign groups that will further the achievement of important U.S. interests. We must, in short, influence these foreign groups.

Psychological operations, therefore, are those efforts designed primarily to influence the opinions, emotions, attitudes, and behavior of key foreign groups in ways that assist in maintaining the national security of the United States. This statement sounds crass and self-centered, but our survey of recent international developments makes clear that the question is not whether psychological considerations will play a key role, but how.

A positive approach to psychological considerations generally is mutually beneficial to the foreign groups and the United States. What is involved is seldom a Machiavellian manipulation of the beliefs of others against their best interests. Generally, what is needed is an honest effort to understand and respond to the cultural conditioning and aspirations of others to achieve a result beneficial, in some degree, to all concerned.

The response that will most often benefit the United States—peaceful change, international cooperation, economic development, and improved communications—is also beneficial to the other country (or countries) concerned. Often, the US interest will be well served simply by the country avoiding coming heavily under the domination of the Soviet

Union or China. Efforts to influence others cannot be always open and above-board, but the goal, as these considerations make clear, is not an invidious one.

Psychological operations are not something apart from the diplomatic, military, and economic elements of our national security policies and programs. Nor are they a substitute for these other sources of power. They draw on and reinforce these activities and make them more effective. Psychological operations are ineffective without these other activities. The psychological success of the United States in the Cuban missile confrontation of 1962 was possible because the United States psychologically utilized effective military capabilities while the Soviet Union did not. Psychological operations are essential if the United States is to serve its best interests—the skillful nonuse of its great power.

One difficulty in defining more precisely the idea of psychological operations is that the concept has a certain vagueness about it. It is hard to visualize. We can see a diplomat, or a military weapon, or an economic development project, but it is hard to point to anything equally concrete and say, “that is a psychological operation.”

This difficulty stems from the intimate interdependence between psychological considerations and the other elements of our national security policies and programs. What is appropriate in psychological operations is closely interrelated with our other activities and to whom, where, and why we do them. We cannot separate and identify a single national PSYOP doctrine or strategy. By the same token, psychological operations involve more than simply information, communications, or even propaganda.

OPERATIONS DEFINED

Efforts have been made to develop adequate working definitions of psychological operations. The Joint Chiefs of Staff have defined the operations, for military purposes, as those that:

... include psychological warfare and, in addition, encompass those political, military, economic and ideological actions planned and conducted to create in neutral or friendly foreign groups the emotions, attitudes, or behavior to support the achievement of national objectives.

“... Another proposal develops the concept of ‘strategic psychological operations’ as aimed at influencing and shaping decision-makers’ power to govern or control their followers.”

These definitions tend to suffer from overstatement, overinclusiveness, or vagueness. It is hard to tell from these definitions what is, and what is not, a psychological operation. Greater precision seems necessary if we are to have a workable concept.

WARTIME SITUATION

We can clarify better what is involved by looking at an extreme case—the situation in wartime. Here, our goals are starker. It is easier to see whom we want to influence and the value to us of influencing them in certain ways. We want the enemy to stop fighting. The ability of our forces to move toward this goal is greatly improved if we can persuade

enemy troops to defect or impair their morale so as to lower their abilities as fighting forces. Leaflet and other operations are carried out to achieve these ends. In this instance, psychological operations become something clear and concrete.

The broader impact of psychological considerations is similarly clearer in wartime. It is not just our military forces, economic measures, and diplomatic efforts that induce an enemy to stop fighting—although they are essential. We improve our chances of getting an enemy to stop fighting if we increase his doubts and fears and the thought that he has more to lose than to win by continuing.

The German perception of the demand for “unconditional surrender” almost certainly lengthened the war in Europe, and strongly influenced the way it ended and the shape of the postwar world. Japanese attitudes toward the Emperor and U.S. awareness of this concern had a great deal to do with ending the war in the Pacific and the more favorable postwar events in that area.

We have trouble delimiting psychological operations because we live in an era that is neither peace nor war. Our goals are not as unambiguous as they are in wartime, and the usefulness of our efforts to influence others is correspondingly less clear-cut. We face a dilemma because we long for a world of peace and freedom. Unfortunately, conflict, however we label it, exists in the world in which we must live. We must acknowledge it clearly, both to endure it and to move from it to an era of negotiation. For both purposes, attention to psychological considerations is essential.

* * * * *

IS INTERNATIONAL PERSUASION SOCIOLOGICALLY FEASIBLE?*

BY DANIEL LERNER

Persuasive communication usually has its greatest effect in reinforcement rather than conversion. However, some contemporary problems have been exacerbated, not ameliorated, by international communication.

The answer to the question of whether international persuasion is sociologically feasible, in general, is obviously Yes. International persuasion is sociologically feasible, on the face of it, because it has occurred in many different times, places, and circumstances. Our task here is to differentiate the circumstances under which international persuasion is more, or less, feasible.

The central point is that international persuasion is subject to the same conditions as any other form of persuasive communication. In general, international persuasion is more feasible when it operates upon existing predispositions in the foreign audience. That is, obtaining a “reinforcement effect” is far more feasible than obtaining a “conversion effect” for international, as for all, persuasive communication.

A second major condition is that the feasibility of international persua-

* From “Is International Persuasion Sociologically Feasible?” *The Annals of the American Academy of Political and Social Science*, Vol. 398 (November 1971), pp. 41-49. Reprinted with the permission of the American Academy of Political and Social Science and the courtesy of the author.

sion hinges directly upon the historical and existing state of relations between the sending and receiving nations. Where there is a long tradition of friendly relations between two or more nations, messages are likely to pass between those nations more freely and more effectively. Since the motives of the sender are not suspect, in such a friendly relationship his messages are more likely to be accepted at their face value. Such messages will, in this important sense, clearly be more persuasive. A case in point is the exchange of messages between Britain and America.

The situation is reversed when there is a tradition of hostility between the sending and receiving nations. Under these conditions all messages passing between the two hostile nations are likely to be carefully scrutinized and, in the absence of positive evidence to the contrary, treated with suspicion of motives and doubt of purposes. Clearly, such conditions greatly reduce the feasibility of international persuasion. The obvious case in point is communication between the United States of America and the USSR.

The state of the world political arena, at any given time, provides a third major set of conditions which affect the feasibility of international propaganda. When the world arena is relatively pacific, the flow of international traffic is likely to be larger, freer, and therefore more persuasive. In times of war and crisis—war being the most extreme form of international crisis—the world communication network contracts. Comparative studies in content analysis have shown that this contraction operates within as well as between nations. The vocabulary of crisis tends to become more limited and constrained as the crisis deepens and lengthens.

WARTIME PROPAGANDA

Fewer symbols are used to articulate national policies and defend national actions. A single symbol such as "national defense"—as was shown in the studies of Pool, Lasswell, and Lerner—is used to rationalize and justify a great variety of actions which, in times of peace, are justified in terms of other symbols.¹ This internal contraction of communication is multiplied in the international arena. In times of war and crisis, nations appear to talk to each other through clenched teeth. As symbolism contracts, skepticism rises and persuasion is reduced. "Listening to the enemy," in some countries, becomes a crime.

Yet it is essential to note that, even under the extreme hostility of total war, some measure of international persuasion remains feasible. The conspicuous examples are the great propaganda and psychological warfare "campaigns" of the two world wars. Harold D. Lasswell's classic study of World War I established this point.² My own study of the Allied campaign against Nazi Germany provides further documentation for World War II.³ People in Germany, both military and civilian, not only listened to the enemy but increasingly came to believe what he was saying as the war increasingly went his way.

International persuasion, under wartime conditions, has been feasible in the measure that the sender has met the two major conditions mentioned above: credibility and reinforcement. The outstanding example of successful building of credibility is, of course, the wartime British Broadcasting Corporation. The BBC established its reputation for truthfulness largely by being truthful. The core of this "strategy of truth," as practiced by BBC, was never to tell lies—or, more precisely, never to tell lies that could be found out.

An illustration of the BBC technique was its practice of beginning each newscast—all day, every day—by giving first place to British setbacks, losses, defeats. Over the years this produced an image of BBC truthfulness that made it a model of credibility, in Germany as well as elsewhere. Ultimately, this asset of wide credibility became the basis for the high order of persuasiveness which BBC attained during the critical middle years of the war (1942–1943) and for the important role it played in persuading a large number of significant Germans that they had lost the war in its final years (1944–1945).

Reinforcement as a central condition of persuasion is vividly illustrated by the military propaganda campaign against the *Wehrmacht*. The specific case in point was the campaign to increase the surrender rate among German soldiers. During the years when Germany occupied most of Europe, and seemed likely to win the final victory, such propaganda was not feasible. As the tide began to turn, however, and German military units encountered severe dangers and increasing deaths, the predispositional machinery for surrender came into operation.

Central to the Anglo-American propaganda effort at this point, was its abstinence from direct attacks upon Hitler. All German soldiers had sworn an oath of loyalty to the Führer and many of them, even under conditions of extreme peril in combat, felt themselves bound unto death by this oath. The Allied propaganda campaign avoided challenging this deep psychological commitment; that is, it did not seek a "conversion" effect. Rather, it moved steadily in the direction of "reinforcing" any predisposition to surrender among soldiers in losing combat. The most effective single message concerned a "safe conduct pass" promising them good treatment as prisoners of war. The psychological basis of its reinforcement impact has been described by Edward Shils:

Belief in the veracity of this appeal was no doubt based on the attitude that the British and the Americans were respectable, law-abiding soldiers who would treat their captives according to international law. As a result of this predisposition and the wide use of the safe-conduct leaflets, as well as our actual practices in treating prisoners well, the German soldier came to have no fear of capture by British or American Troops.⁴

In passing, it is interesting to note that the psychological warfare campaign against Japan in World War II followed the same strategy. The Emperor, as key symbol of Japanese identity and loyalty, was never directly attacked by Allied propaganda. Instead, as Japanese soldiers found themselves increasingly in painful and perilous situations, Allied

propaganda sought to make surrender easier ("to grease the skids") for those Japanese soldiers who were already predisposed to it.

PROPAGANDA SINCE WORLD WAR II

These examples from the propaganda campaigns of World War II illustrate that international persuasion is feasible even under the most extreme conditions of international crisis. Other examples of more recent vintage can be supplied by most readers A particularly interesting case to ponder is that of "nuclear blackmail." How are we to evaluate the "international persuasion" exercised by Khrushchev's atomic threats during the Suez crisis of 1956? How are we to evaluate the "international persuasion" exercised by the airlift during the Berlin crisis or by Kennedy's standfast language during the Cuban missile crisis? Although appraisals of these essentially propagandistic activities have varied, it is plain that they did in fact considerably influence the course of events. Further studies will help to clarify the underlying "code" that made these international communications persuasive.⁵

Other topics in the relationship between international communication and "persuasibility" merit careful scholarly attention.⁶ Among these is the role assigned to the numerous and various organizations for international cooperation that have been created since World War II. Examples on the Western side are the European Community, North Atlantic Treaty Organization, and the general Agreement on Tariffs and Trade.⁷ Also relevant is the transformation of the Pan-American Union into the Organization of American States. Of special interest, in terms of world communication, is the global network of alliances parallel to NATO that has been constructed by the United States: CENTO (Central Treaty Organization), SEATO (South East Asia Treaty Organization), and ANZUS (Australia, New Zealand and the United States). Parallels on the Soviet side of the bipolarized world arena are the Council for Mutual Economic Assistance and the Warsaw Pact, which seek, largely through communication techniques, to guarantee the military and economic cohesion of the communist states under Soviet management.⁸

A communication operation of explicit global purpose is the United Nations. The UN has been subject to the strictures affecting all "legislatures" that seek to govern units of unequal power on the basis of parity, that is, one vote per head. Successive governments of France, for example, have made it clear that they do not take seriously any "legislation" enacted by a body in which the vote of Gabon is equal to that of France. This view, stated less candidly and brutally, is shared by many other large member-states of the UN, including the USA and USSR. The long-term success of the UN, however, is less likely to be determined by its activities as a "legislature" than by its effectiveness as a "forum" of world communication. It is this aspect of the UN that most deserves study by communication specialists.

Perhaps the most complex problem of feasibility in "international persuasion" arises from the worldwide concern with development. Involved there is nothing less than the future of international relations between the rich and poor countries of the world. Sociologically, the disparities are

enormous. Consider the single disparity of per capita income that separates the United States, which is moving toward \$6,000 per annum, from India, which is just barely getting beyond \$60 per annum. These simple figures represent what economists call "orders of magnitude." Between \$60 and \$6,000 per person per year stretches a money gulf that encompasses virtually everything we call the modern way of life. As Paul Samuelson has put it, most of what is distinctive in modern culture may be the common characteristics of any society that exceeds a per capital income distribution of \$3,000 per year.

The relatively few rich countries of the world have nearly everything the the numerous poor countries of the world do not have but are seeking to acquire.⁹ An urban, literate, technological, participant, and rich society like the United States can now feed itself by the labor of less than 7 percent of its population—and still have a lot of food left over to give, sell, or destroy. A rural, illiterate, overpopulated, underequipped, and poor country like India cannot feed itself adequately even with the labor of over 70 percent of its population. We are speaking here of economic disparities—in a sense which includes social, psychological, and political disparities—that cumulate to several large "orders of magnitude."

A WIDENING GAP

To return to our original question: "Is international persuasion sociologically feasible?"—under such conditions no easy, optimistic answer is possible. Indeed, the record of the past twenty years of effort in "development communication" is marked with failures and frustrations. When President Truman initiated the "bold new program" of development in 1949, most people concerned with development communication set out on their great enterprises on the premise that they would create a "revolution of rising expectations," and that this revolution would be a Good Thing. It would be good because rising expectations, according to the pattern established over five centuries of Western history, would stimulate the poor peoples of the world to revive the energies and acquire the skills needed to satisfy their new wants.

As it turned out, this was easier said than done. The poor peoples of the world have indeed lived through a "revolution of rising expectations" during the past twenty years, but their wants have not been satisfied. Far from it. On the contrary, the gap between the rich and the poor nations has continued to increase over these years.¹⁰ This is a major complication in international communication between rich and poor countries.

Another major complication is that the gap between what people want and what they get has widened within as well as outside most of the world's poor lands. This increasing imbalance in what I call the "Want/Get Ratio" (WGR) has led the poor peoples in the direction of a "revolution of rising frustrations." I have presented this view of our global future elsewhere.¹¹

It remains, in concluding this brief overview of feasibility, to indicate why international communication has been less "feasible" over the past two decades of development. The failure of development efforts has been, in large measure, a failure of development communication. We have

taught the poor people to want the "good things of life" available in the rich countries. We have not taught them how to get what they want.

Where we have failed in the past two decades we must now learn to succeed in the next two decades. The technology needed to do this job is available in the form of transistors, satellites, and the spinoff from these major technological advances of the past few years: video tapes, audio tapes, kinescopes, cassettes. This technology can be adapted to the needs of poor countries with relative ease. The harder communication task is to create "software"—that is, to integrate men, ideas, programs, and management in a "continuous feedback loop"—which can make productive use of the available hardware.

So grand a purpose will involve a massive and concerted effort of transnational experimentation, evaluation, and action. This effort cannot be made by the rich nations *for* the poor nations. It must be done by the rich *with* the poor nations, acting in cooperative enterprises. The key word cannot be "transfer"; it must be "transformation." In the end, a true world communication network will become operative only when the poor nations of the world can demand, and deserve, "equal time" with the rich nations.

This is not now the case by a long shot. The current technology of global communication is mainly in the hands of the superpowers. As a result, traffic flows in the world communication network tend to be unilaterally from the rich to the poor, from the strong to the weak. In such a system, all "disparities"—economic, social, psychological, political—contaminate international communication. It is in the interest of all those who believe in "equal time" to help construct this indispensable condition for the just, and effective, operation of a truly global communication network.

Only then will international persuasion, on a world basis, become sociologically feasible—in the worthwhile sense proposed by the editors of this journal.

PSYOP AND RELATED ACTIVITIES*

BY FRANCIS M. WATSON, JR.

As communication involves the total spectrum of human actions, so all human interaction, irrespective of intent, communicates: PSYOP policies and actions should be considered in terms of this premise.

In any meaningful study of psychological operations, the PSYOP concept must be defined and its parameters identified against those military activities that support or are closely related to PSYOP and against the total psychological impact a military force has on its target audiences. This essay seeks to discuss the connection between PSYOP and its supporting and related military activities.

In this review, note will be taken of matters that can be considered as having psychological impact on the audiences which PSYOP is seeking to reach. That is, although no determination will be attempted about whether or not an action was planned or conducted, in contrast to being simply incidental to the military operation or presence in the area under study, PSYOP is here considered to include psychological warfare and propaganda and to encompass those political, military, economic, and ideological actions that are believed, in fact, to impact on the emotions, attitudes, or behavior of neutral or friendly foreign groups as they relate to the achievement of those U.S. objectives stated or implied in the literature studied.

Attention will therefore be given to each of the following activities, as being so closely related, or intricately involved, in audience impact as to be inseparable from PSYOP:

1. Civic Action
2. Civil Affairs
3. Community Relations
4. Public Information
5. Intelligence
6. Troop Behavior
7. Populace and Resources Control

These activities and functions must be identified rather precisely at the outset. Some definitions of the terms used in this review must be made. Precise points of departure must be established from which appraisals can be made that may have some usefulness in the future development of doctrine or the design of training programs, for even a cursory review of

* Original essay by Francis M. Watson, Jr.

the reports and other literature dealing with these functions indicates great similarities in the names of some of the activities undertaken, and also great differences in objectives. For example, some of the same activities may be undertaken as civic action and community relations, but differences in goals, funding, and technique are great. Thus, each of these functions will be defined and the doctrine and tactics intended for each will be stated and briefly discussed.

CIVIC ACTION

Civic action is listed in the *Dictionary of U.S. Military Terms for Joint Usage*, hereafter referred to as *JCS Pub 1*, as synonymous with military civic action and was defined in the late 1960s as:

...the use of preponderantly indigenous military forces on projects useful to the local population at all levels in such fields as education, training, public works, agriculture, transportation, communication, health, sanitation, and others contributing to economic, and social development, which would also serve to improve the standing of the military forces with the population. (U.S. forces may at times advise or engage in military civic actions in overseas areas.)¹

Conceived within the context of attitude-and-opinion-change efforts, civic action has been repeatedly used in the field to influence civilian groups toward various objectives sought by the military forces, as well as to achieve environmental improvement.

Although many writers contend that the U.S. military has been conducting civic-action-type activities throughout its history, the specific program to which *JCS Pub 1* addressed itself, and which has received so much emphasis in the field, seems to have begun much more recently. Virgil Ney attributes the origin of the present concept to

...Ramon Magsaysay, a former World War II Filipino guerrilla captain, [who] became Secretary of Defense of the Republic of the Philippines. His astute appraisal of the Hukbalahap insurgency was that basically not all Huks were Communists. . . . There was a large group of good Filipinos within the Huk insurgency movement who were there only because of political factors. Magsaysay decided that it was possible to counter insurgency with other than military or violent tactics. In reality, his new tactic was "civic action" and it was based upon subtle but practical operations conducted by the troops in order "to make friends and influence people" in favor of the *de jure* government.²

Brought to the U.S. Armed Forces as a Cold War technique and spurred by the Draper Report³, civic action has received attention ever since. For example, the early PSYOP and civil affairs field manuals do not refer to the concept but it appeared in both in the early 1960s under such headings as "cold war techniques" or "counter-insurgency operations." The 1962 civil affairs manual indicated that:

Civic action, an aspect of civil affairs, is any function performed by military forces in cooperation with civil authorities, agencies, or groups through the use of military manpower and material resources for the socio-economic well-being and improvement of the civil community with a goal of building or reinforcing mutual respect and fellowship between the civil and military communities.⁴

The Office of the Chief of Military History dates the origin of civic action as follows:

There was one provision of the 1961 [Congressional] Act that had appeared first in the Mutual Security Act of 1959. Although the concept of civic action had been used previously in Iran and extensively in the Armed Forces Assistance to Korea program following the Korean War, it did not become official until 1959. . . . Some

C.A. [Civic Action] programs had been initiated under this provision in the 1959-1961 period, but the big impetus came in the 1961-1965 period.⁵

U.S. Army Colonel Robert Slover testified before Congress on civic action in June of 1961. He told the legislators, "civic action should be looked upon as both a preventive or countering measure to prevent deterioration in a country, and also as a technique of guerrilla warfare. . . ."⁶ Slover was a civil affairs specialist and one of the Army's prime spokesmen on civic action at that time. The thesis of his testimony before Congress—and he quoted considerably from FM 41-5, the joint-service manual on civil affairs—was that action was a means for demonstrating brotherhood between the civilian and his own military forces in the improvement of political, economic, and social conditions in their country. Again, these are matters heavily laden with psychological subtleties well within the scope of PSYOP. PSYOP manuals themselves have very little to say about civic action, although they do allude to PSYOP exploitation of civic action successes and PSYOP officers' advisory assistance to their own commanders and indigenous military forces on civic action programs. In the field, however, civic action is effected under the aegis of G5/S5 officers, most of whom seem to be PSYOP-oriented.

Any consideration of contemporary civic action and PSYOP must also embrace community relations:

...in spite of interdepartmental agreement on the definition of the term, "military civic action" has come progressively closer and closer to meaning anything that any soldier or unit does for "the people" that appears at the time, and to the doer, to be good for them [the people]

Others have expressed similar concern for the mixing of military-civil relations programs involving psychological impact:

...the term "civic action" has been used to refer to a wide range of activities that have traditionally been known in the military by other labels, such as engineering, civil affairs (or military government), public relations, civil defense, troop-community relations, and psychological operations.⁸

COMMUNITY RELATIONS

Community relations has most often been undertaken in the military as a subfunction of public information, both because it is usually an "operating responsibility of the information officer," and because it has usually been conducted in conjunction with efforts to gain favorable coverage in the mass media and thus assist in "developing a good image of the Army...."⁹ In overseas areas, however, the community relations function has tended to drift toward the G5 staff section, especially with the advent of community relations advisory councils (CRACs) in such places as Korea. The 1971 PSYOP doctrinal manual envisaged coordination of the PSYOP staff officer with the civil affairs officer, for "PSYOP implications on proposed civic action and *community relations* programs, . . . include the impact of these programs on local cultures and the likelihood of popular support for projects." (Emphasis supplied.)¹⁰ Perhaps the greatest difference between civic action and community relations is most clearly seen in the experience of these CRACs. The councils, as well as the programs involved, tend to be initiated because of some problem the

military perceives in its relations with the civilian community and not because of any apparent or expressed need within the civilian community. Both the public relations nature of community relations and its possible confusion with civic action can be seen in the following passage from the 1969 civil affairs manual:

Many of the individual projects undertaken in a military civic action program will have a superficial resemblance to community relations activities. While improved community relations of the military is an important byproduct of the military civic action effort these relations are not, at least during Phase I of insurgency, the primary product. Military civic action should be designed to make real, lasting improvements to the social, economic, and political environment. For example, if a military unit were to build, maintain, or staff a needed school this would be true military civic action whether or not it also produced a greater civilian respect for the military. On the other hand the activity of a military unit in sponsoring an occasional outing or meal for the children of that school would be primarily in the nature of a community relations project. As such, it would build up goodwill and a better relationship between the military forces and the people, but may be a misapplication of resources which should be devoted to true military civic action.¹¹

Appearing on the same page with a reprint of the JCS definition of military civic action quoted earlier, the above passage made no distinction—as the JCS definition did—between the roles of U.S. and indigenous military forces. This distinction can become a key issue. The same manual (FM 41-10), however, did distinguish those roles in connection with community relations:

Unless the U.S. forces (and their host country allies) understand the requirement for good community relations and proper conduct, the best planned civil affairs and PSYOP effort by CMO staff elements and units will be of little value. The rules of troop behavior required in a counterinsurgency situation are complicated. U.S. personnel must not only conduct themselves to the best advantage; but, by their example as well as by their advice encourage the indigenous military to improve its conduct. Mere generosity on the part of U.S. troops is not enough, particularly when that generosity is practiced with an unconscious show of wealth, a disregard for local custom, or is accompanied by loud or unusual behavior.¹²

The Army Regulation on public information, although it did little to clear up the overlap with civic action, probably gave the purest indication of community relations, defining it as

That command function which evaluates public interest, and executes a program of action to earn public understanding and acceptance.¹³

PUBLIC INFORMATION

That there is a relationship between public information and PSYOP is evident, especially when there is an overlap in audiences, as suggested by the following paragraph from the civil affairs manual:

The impact on civil-military relations of the information Officer is not limited to his participation in community relations matters. The command information program for military personnel and for the civilian employees must be coordinated with the psychological operations program if one is being conducted. Information intended only for the education of U.S. military personnel often will reach civilian audiences and must be in consonance with U.S. released information directed at such civilian audiences or released to the world at large. In today's world the mobility of individuals and the profusion of mass communications is such that neither the information officer nor the psychological operations officer can hope to address an audience isolated unto itself. Further, news released abroad to U.S. and international news media and intended for audiences outside the theater of operations will also return to the locale of such operations and influence civilian audiences. Therefore, coordinated information programs must be scheduled if credibility is to be retained.¹⁴

The first theater-level press officer appeared in World War I within the Press and Propaganda division of the G-2 section of General John J.

Pershing's headquarters. Referred to as "G-2," this office was in the company of three other G-2 subsections labeled: "Enemy Information," "Counterintelligence," and "Maps." Such an association with intelligence or PSYOP would be considered unthinkable now. Indeed, the Army came out of World War II facing a Congress that was suspicious even of the term "public relations"—thus the imposition of the term "public information" for the Army's contacts with the public press.¹⁵ The function was pushed completely away from any suggestion of PSYOP. More recently as recognized by the passage just quoted from the civil affairs manual, the scope and speed of world news collection and dissemination have forced the PSYOP program to be aware of what is being said by the public information staff, because the two are often speaking to the same audiences, even if indirectly through the world press.

The complex interaction between PSYOP and public information was at least partially reinforced in the following two passages from the PSYOP doctrinal manual:

[The PSYOP staff officer provides] advice on the effects of hostile PSYOP and recommends countermeasures for use in command information programs, [i.e. those directed to US troops], public information programs [information to the world mass media], and PSYOP.

.... The information officer coordinates the command information program with community relations programs and the PSYOP program. The command information program for military and civilian personnel must be coordinated with the PSYOP program. Information intended only for U.S. military personnel often will reach civilian audiences and must be in consonance with U.S. released information.¹⁶

INTELLIGENCE

In many ways the historical relationship of PSYOP and military intelligence is similar to that of PSYOP and public information in that both were very closely related at the outset, diverged, and are once again drawing close. The advent of an almost saturation level of mass communications in the world has apparently been the main influencing factor. In earlier days, military intelligence and PSYOP were both concerned almost exclusively with the same target, the enemy, and interested in essentially the same information about that target—its composition and the weather and terrain conditions under which that target would be encountered. Evolution of the concern of intelligence along lines manifestly related to PSYOP are evident in the following passage taken from the chapter on "Cold War and Stability Operations" in the 1971 PSYOP doctrinal manual:

Intelligence Operations. In addition to enemy, weather, and terrain [traditional combat intelligence concerns], the population is included as the fourth major consideration of PSYOP intelligence. An important intelligence objective is to persuade the populace to provide information to government or allied forces. Timely and accurate intelligence is essential to successful stability operations. The amount of intelligence furnished by the population is an indication of PSYOP effectiveness. Prior to operations, the PSYOP officer assesses attitudes and behavior of the target audience toward the friendly and insurgent forces. PSYOP endeavors to convince the target audience [to report on the insurgents].¹⁷

Thus, there is a complex interrelationship between PSYOP and intelligence, as a result of which the PSYOP program is both a producer and consumer of intelligence—as well as an observer of intelligence as a

measure of its own success. The literature survey suggests that it is in its consumer role that PSYOP has its greatest problems, a fact demonstrated by the frequency with which the intelligence sections of the PSYOP manuals have been changed in recent years, changes usually expanding the "sources of PSYOP intelligence" portions of the manuals and reducing specificity about the types of information sought. Neither training literature nor field reports indicate that PSYOP and intelligence elements of the Army have come to agreement on such specifics.

TROOP BEHAVIOR

The term "troop behavior" does not convey the operational ramifications many see it as having on PSYOP. Dr. Paul M. A. Linebarger, whose career association with PSYOP included both active duty participation in the program as a military reservist and extensive research, said the behavior of individual soldiers was in itself

... a major form of communication far more important than leaflets, radio broadcasts, or posters. The role of the soldier as he is seen by the people whom he passes is a real contributing element.... In heavily settled areas such as Western Europe or much of East Asia, the soldier plays an indirect psychological warfare role which it is difficult to overestimate.¹⁸

Even in the early 1970s the PSYOP manuals were almost completely silent on the role of an individual soldier as a PSYOP participant. They were even more so on the responsibility of the PSYOP staff officer as a source of advice or point of coordination, on the impact of troop behavior on the PSYOP situation, or on the training of the individual for his PSYOP role. For example, the latest doctrinal manual published in 1971 made no reference to these matters in its description of the duties and responsibilities of the PSYOP staff officer. Nor were they referred to as points of coordination with either G1 (personnel) or G3 who share responsibilities for troop morale, behavior, and training. The PSYOP operations manual published in 1966 did contain this paragraph:

[PSYOP planning will insure] *Friendly Troop Orientation*. In any military operation, specific plans must be made to orient friendly troops in psychological operations being conducted. This orientation must never be taken for granted, especially in tactical situations where troops might be unaware that enemy soldiers and civilians are actually endeavoring to rally for amnesty, defect, or surrender. The purpose of psychological operations should be explained to *all* personnel assisting in the mission. Their interest and cooperation will be more genuine if they are given an English translation of the message to be disseminated. If the mission is to promote defection, friendly troops must know how, when, and where the enemy may come over, so that they will recognize the defectors as such. Failure to orient troops beforehand could lead to the killing of enemy troops who actually wish to defect or surrender, thus destroying credibility and adversely affecting future psychological operations.¹⁹

However, the above passage merely sought to preclude one small, negative PSYOP function. It was certainly an inadequate analysis of the potential negative effects of failure to emphasize the PSYOP consequences of troop behavior, and, apart from the very general injunction at the beginning of the passage, made no effort to elucidate the need for positive PSYOP-oriented troop behavior.

CIVIL AFFAIRS (CIVIL-MILITARY RELATIONS)

In considering troops as large groups rather than as individuals, civil affairs (or civil-military relations, as the newer manuals are beginning to

term it) now relates to PSYOP because it is now recognized to have a psychological impact on foreign target groups. The October 1969 edition of FM 41-10 contained what appear to be somewhat interlocking definitions for both:

Civil affairs includes those phases of the activities of a commander which embrace the relationship between the military forces and civil authorities and people in a friendly country or area, or occupied country or area when military forces are present. Civil affairs includes, inter alia: (2) [sic] Matters concerning the relationship between military forces located in a country or area and the civil authorities and people of that country or area usually involving performance by the military forces of certain functions or the exercise of certain authority normally the responsibility of the local government. This relationship may occur prior to, during, or subsequent to military action in time of hostilities or other emergency and normally is covered by a treaty or other agreement, express or implied; (2) Military government[:]. The form of administration by which an occupying power exercises executive, legislative, and judicial authority over occupied territory (AR 310-25).²⁰

CIVIL-MILITARY OPERATIONS.... The ACof, G5, Civil-Military Operations (CMO) officer is the principal staff assistant to the commander in all matters pertaining to political, economic, social, and psychological aspects of military operations. He has primary staff responsibility for those actions embracing the relationship between the military forces and civil authorities and people in the area of operations to include internal assistance and development operations, and for those actions in which PSYOP techniques are used to support the achievement of command objectives by creating in target groups the emotions, attitudes, or behavior desired....²¹

The overlap between these two passages is easily seen. Also easily seen is the continued delicacy with which the Army handled the subject of military government within the overall civil affairs function. This was part of a trend underway for several years. In 1960-1961 Dyer, Higgins, and Hausrath wrote:

It is not clear at present whether the Army itself considers that its main activity in this area [civil affairs] is in the field of military government or in the field of civil relations. The Field Manual, FM 41-10, is written in terms of military government. There are signs that the Army nevertheless is becoming increasingly concerned with civil relations....²²

These analysts were, of course, writing years ago and were referring to the 1957 edition of FM 41-10, which, indeed, was military government-oriented. In fact, its title was *Civil Affairs/Military Government*. The 1957 manual was superseded by a May 1962 version, titled *Civil Affairs Operations*, and by later editions in August 1967 and October 1969, with similar titles. Comparison of these publications confirms the Dyer-Higgins-Hausrath observation that the Army has been increasingly concerned about relations with civilians, but somewhat hazy on specifics and particularly hesitant in addressing the issue of military government—or such matters as occupied territory. This has definite significance for PSYOP, especially in such matters as consolidation PSYOP. For example, although the language has been tempered—much along the patterns detected by Dyer, Higgins, and Hausrath—consolidation PSYOP “are directed towards the population liberated or occupied areas to facilitate military operations and promote maximum cooperation with the occupying power.”²³ At least this has been the traditional context for consolidation PSYOP, and it was still so described in the 1966 version of the PSYOP operational manual, FM 33-5. The 1971 PSYOP doctrinal manual

and the 1969 civil affairs operations manual, FM 41-10, tended to relegate consolidation PSYOP to "limited or general war" or to blend its elements into the same type of subfunctions one finds in counterinsurgency operations—military civic action and populace and resources control, for example.

However Greenspan's writings to the effect that "occupation" and "military government" are terms most appropriately assigned by de facto considerations seem the more accurate.

Military occupation is always a question of fact. The Hague Regulations state (Article 42): "Territory is considered occupied when it is actually placed under the authority of the hostile army.... The occupation extends only to the territory where such authority has been established and can be exercised." It follows that in an effective occupation the previous government in the territory has been rendered incapable of exercising there its governmental authority, and that the occupying force has substituted its own authority for it....²⁴

This point of departure is not offered contentiously, but with the idea that if it appears to apply to some of the actions the Army has taken within the scope of stability operations, the Army and the individual commanders involved would benefit by clarification of the applicable doctrine and precise definition of the operations involved. The erosive effects of equivocation on such terms as "occupied area" and "consolidation PSYOP" in successive manuals is to be avoided. It appears, for example, that the Army has been criticized severely in the world press at times because the commander in a local operation has not taken upon himself the full responsibility that his tactical decisions had thrust upon him as de facto military occupant. A clarification of the doctrine might at least present him with alternatives before he takes such decisions. Without further analysis, it would seem that the present situation is often loaded to give the PSYOP advantage to his opponent while making little if any change in the actual civil affairs situation.

POPULACE AND RESOURCES CONTROL

PSYOP support of populace and resources control is seen in some places in the literature as limited to counterinsurgency operations;²⁵ in other places it is combined with civic action in a limited or general war context.²⁶ Again, it is a matter with serious impacts on the civil population, curtailing "legitimate as well as subversive activities" and thus of specific concern in the appraisal of PSYOP.²⁷

CONCLUSION

In summary, this essay seeks to evaluate PSYOP in the context in which it operates, that is, not only as a source of propaganda directed toward intended target audiences, but as an activity inseparable from the accompanying impacts on these audiences created by the military forces of which the PSYOP effort is a part. This view is perhaps best illustrated by Hausrath's description of the civil-military relationship.*

The Army lives in an environment of people. On the domestic scene as well as abroad, the Army's presence requires real estate, equipment, food and supplies, housing, recreational facilities, personal services, transportation facilities, labor,

*Note. A part of Hausrath's study was incorporated into the 1967 edition of the Civil Affairs Manual.

and a myriad of other things for which it competes in the local economy. Its presence frequently congests the area, overtaxes the capacity of utilities, inflates prices, and crowds schools. Although it also creates business opportunities and expands the local economy, it draws new population to the area, and these newcomers are not always wanted by the earlier residents.

When the Army moves or maneuvers it may trespass, destroy or damage property, and cause injury to persons and livestock. Although the Army compensates for such damage, these occurrences are likely to irritate and alienate local people, or to invite exploitation by them.

The presence of a military force causes the social and cultural atmosphere of a community to change, and makes political and governmental problems more acute and numerous. The daily lives of the local people are affected, sometimes seriously disrupted. Local mores, respected customs, and valued traditions are infringed upon—often never to be restored. These changes are likely to be resented by many local people, and strong, negative attitudes and emotions may be generated. Although there are advantages as well as disadvantages to the local people in having a military unit in their area, benefits are quickly accepted and soon taken for granted, whereas irritations build up, rankle, and breed antagonisms. An accumulation of these irritations can result in acts of violence or persist as latent or expressed oppositions.²⁸

Even though the above passages seem forceful in stating that the impact of a military organization on a civilian environment is very great before the first shot is fired, they do not mention what happens in a combat situation. Under these circumstances the total impact would be even greater.

The importance of the total impact concept in the appraisal of military PSYOP cannot be overstressed, for if purposeful communication is to be effective it must reflect reality, reality that is significantly shaped by the activities of and reactions to modern military forces. A PSYOP action plan that fails to take this into account will clearly be less effective than under optimum conditions and may even seriously prejudice the effectiveness of future psychological operations.

³ U.S. President's Commission to Study the Military Assistance Program, *Report of the President's Commission to Study the Military Assistance Program* (Washington, D.C.: Government Printing Office, 1959), known as the Draper Report. As a result of extensive Congressional debate on military assistance, President Eisenhower established a commission under William H. Draper to evaluate the entire program. Among other things, the committee recommended that emerging nations, not faced with an immediate threat of external aggression, should be given predominantly economic aid. The committee noted that the United States should encourage the military in underdeveloped countries to use their resources for economic objectives. From this recommendation came a spurt of interest in civic action programs.

COMMUNICATION AND INSTITUTION BUILDING IN DEVELOPING COUNTRIES*

BY JOHN H. JOHNS

Communication can provide the major link required for institution building in developing countries.

INTRODUCTION

The purpose of this essay is to develop concepts of institutions and institution building that can be used as a frame of reference for U.S. programs, U.S. Army activities, and potential Army contributions to the overall U.S. effort to assist host countries to build strong institutions capable both of effecting social change with a minimum of violence and of resisting subversion.

As used here, a nation is viewed as a social system consisting of a large

* Original essay by John H. Johns

number of small, close-knit groups (that is, micro-groups), which are connected and linked in a pyramidal fashion by larger, more complex groups (that is, macro-institutions), which are in turn integrated into the overall national system. The small, intimate groups are the basic means of social control within a society, while the larger macro-institutions serve as coordinators, regulators, integrators, communication systems, and linkages for these smaller groups.

In order to function as a viable system, a nation must have a certain amount of unity. Unity of action in a social group is brought about by mutual behavioral adjustments of the individual members of the group, so that the action of the group as a whole has a common aim. Concerted action is the result of the integration or coordination of individual actions, feelings, and purposes of the group members. The behavior of a social group often becomes so highly unified that one speaks of the "solidarity" of the group. The development of this unity is called "group integration." Social or group unity is called "group integration." Social or group unity does not imply that all members of the group act in the same way or have the same thoughts and feelings. On the contrary, differences of behavior and of thought and feeling, when they favor coordination or adjustment, are necessary for the integration of a group. The unity of the group results from integration of the adaptive feelings and purposes of the group members. They unite in order to achieve some collective purpose desired by most of the members of the group. Group unity is due to the pressure of environment, but even more due to adaptive ideas, feelings, and purposes. This is at the heart of institution building.

The need for a certain degree of social cohesion does not mean that social conflict is necessarily bad. On the contrary, sociologists have long recognized that some social conflict is desirable and serves a useful function. Societies tend to "ossify" or become rigid and unresponsive to the needs of the people when there is no conflict to stimulate change. Unless change occurs with time, a society will become outdated and disintegrate, as almost all societies have done throughout history.

Stability operations seek to manage conflict so that it remains constructive and is not permitted to destroy the entire social fabric by developing into anarchy or by overthrowing legitimate authority.* There is a delicate balance here that man has not yet been able to find. Stability operations, a form of conflict management, will succeed only if that delicate balance is found.

Nationbuilding involves the development of unity in both micro- and macro-institutions. This paper discusses some relevant factors that must be understood if the subsequent discussion about the Army's role in institution building is to be placed in the proper context. The primary focus is on micro-institutions at the grass-roots level.

* As used here, "legitimate authority" is defined operationally by the president, that is, it is a government he has chosen to support. The U.S. Army does not become involved in the business of determining legitimacy.

THE NATURE OF INSTITUTIONS

By "institutions" is meant here any enduring, complex, integrated, organized behavior pattern through which social control is exerted and by means of which fundamental societal desires or needs are met. In short, institutions may be viewed as patterns of interaction among people. This concept is in contrast to the popular view of an institution as an organization of a public, or semipublic character involving a directive body, and usually a building or physical establishment of some sort, designated to serve some socially recognized and authorized end, for example, colleges, orphanages, hospitals, and governmental agencies.

Institutions are an essential element of any joint human endeavor. Humanity has progressed because men have been able to work together to achieve goals that could not be attained by working alone. As societies have become more complex and technological changes have dictated more interdependence among people, it has become necessary for men to develop more complex social relationships. These complex relationships require better communication systems in order that diverse sectors of the society will understand how they fit into the overall system, appreciate the benefits of cooperative endeavors, and have mutual respect for the contributions of other groups in the nationbuilding process. Complexity also brings more conflict of interest and hence the need for increased methods of conflict management.

Institutions may be developed through natural, spontaneous human intercourse, since interaction to meet needs tends to develop certain uniformities over time, some of which tend to persist. The basic need of survival dictates that certain institutions come into being. The "natural" development of institutions in this manner is more likely to happen in the case of small institutions characterized by relatively tangible, short-range goals, for example, the family, clan, local groups. Even when small groups do develop "naturally," there is likely to be a great deal of trial-and-error and the process may be inefficient.

The development of larger institutions, for example, states, nations, and international institutions oriented toward long-range, sometimes intangible, goals, is likely to be less spontaneous. This type of institution is likely to result from deliberate planning, that is, social engineering.

There are several important processes involved in institutional development and maintenance that must be understood if appropriate programs are to be designed to influence these processes. Most of these processes are intangible and subtle.

INSTITUTIONAL PROCESSES

The terms "group" and "institution" are closely related and sometimes used interchangeably. Most social scientists make a distinction between the two but for present purposes the group may be considered a special case of an institution.

There are two types of groups of concern to the social engineer: the micro/"primary group" and the macro/"secondary group." The "primary

group" is a group characterized by close emotional involvement of the members, which gives it primacy in the socialization process. It was first discussed in 1909 by sociologist Charles H. Cooley, who described the primary group as an "intimate association," as a "mutual identification for which 'we' is the natural expression."¹ Cooley's insights were largely impressionistic and gained through subjective observation. In the last few decades social scientists, using more refined and rigorous scientific methods, have confirmed Cooley's observations and have gained a better insight into the nature of these building blocks of society.

The primary group is of critical importance to the social engineer concerned with institution building and the principal concern of the military in its programs of institution building.

The nature of the primary group is to be contrasted with the secondary group. In the latter, relationships are more casual, impersonal, and segmental or fragmentary. In the intimate primary group there is little need for elaborate social structure because its members are bound by a personal loyalty which is stimulated by their common interests and frequent contact.

As the size of a group increases and its membership becomes dispersed in space and heterogeneous in values and goals, however, the regulative power of personal attitudes is considerably diluted. For its own preservation, the group develops means of facilitating indirect contacts and of controlling the behavior of its members through standard patterns, in the form of rules, laws, and official customs.

It is these latter groups which require more elaborate "linkage" functions. A great deal of the resources of the group must be allocated to the function of connecting the "building blocks" to maintain solidarity and unity of effort. This function is performed through communication systems and becomes more elaborate as the size and heterogeneity of the group increase.

The nation as social system can thus be described in brief as follows: a large number of interdependent primary groups with overlapping membership, linked together to form larger, secondary groups. The larger groups are in turn linked to even larger groups in the same manner and so on until a hierarchical structure of interdependent groups and institutions is integrated into a complex system with more or less common goals, values, and interests. The catalyst that holds the building blocks together is communication, which permits shared ideas, values, and similar world perspectives. Cooley had this to say about communications:

By communication is here meant that mechanism through which human relations exist and develop—all the symbols of mind, together with the means of conveying them through space and preserving them in time All these taken together, in the intricacy of their actual combination, make up an organic whole corresponding to the organic whole of human thought; and everything in the way of mental growth has an external existence therein.²

Unquestionably, the vast network of social systems ranging from the two-person collectivity to the nation-state numbering in the millions is dependent upon the persistence of communication; without it the life-line

of interaction would be lost and the systems would quickly collapse. The communication process, then, is the key to institution building. Mass media alone, however, do not offer a solution. It is through the interpersonal communication process in the primary group that people are integrated into the social system, obtain a sense of belonging and involvement in the society, and are committed to the goals of the society.

The emphasis on communication as the key to achieving social cohesion should not be interpreted to mean that satisfaction of the material needs of the people is less important. Social cohesion is a product of improvement in the social, economic, and psychological environment. These cannot be meaningfully separated.

The integration of the national system is achieved in part by macro-institutions which may be called "linkage institutions." These are institutions which act as a framework or process whereby one or more of the elements of at least two social institutions are linked in such a manner that they function as interdependent parts of the larger system. Some institutions, for example, regulatory agencies such as the Interstate Commerce Commission (ICC), exist solely for the linkage purpose, while others, for example, the military institutions, may provide a valuable linkage service as a secondary function. Another example of a linkage institution of a very abstract sort is the national event such as the Fourth of July celebration.

INSTITUTION BUILDING

Simply put, the task facing many of the developing nations is to establish strong building blocks (that is, primary groups) and link them into an overall national system capable of meeting the needs of the people. They can do this piecemeal and haphazardly, as many have tended to do in the past, or they can use the vast body of scientific knowledge available and do it in a systematic manner. The question—whether to be systematic and scientific or haphazard and intuitive—does not necessarily involve the ethical issues of authoritarianism, thought control, or the myriad of other alleged evils sometimes associated with the use of science to control social forces. The question is whether or not we want to use the knowledge we have. The following discussion summarizes some of the principles pertinent to the U.S. task of assisting developing countries to use knowledge to build viable institutions.

Building a viable nation involves a number of interdependent tasks that must be conducted concurrently. First of all, it involves the establishment of new institutions where none exist to meet needs, the strengthening or modification of existing institutions, and/or elimination of certain dysfunctional (from the standpoint of national unity) institutions.

Of utmost importance is the development of primary groups oriented toward the nation's core goals and values. This task is accomplished by (1) identifying the needs of the people at the grass-roots level, (2) ensuring that primary groups and institutions exist to meet these needs, and (3) integrating the people into these groups.

There are many problems associated with the integration of people into primary groups. Social patterns in traditional societies are extremely resistant to change no matter how dysfunctional they may seem to an outsider. This can be overcome somewhat by "change agents" who understand social processes and the particular culture of the people concerned. There is a great deal of knowledge available that social engineers can use to overcome this problem. Voluntary membership and participation in groups is a psychosocial phenomenon that is generally the same in all societies.

At the same time that strong primary groups are being developed, it is necessary to develop the larger institutions and link the primary groups thereto. This task involves not only the development of technical skills required for specific jobs, but more importantly, the development of common goals, values, and mutual respect and understanding among the diverse elements of the institution. Only when these latter conditions exist can an institution possess the cohesion, esprit de corps, and unity of effort needed to function effectively under the adverse conditions characteristic of the developing areas of the world.

ROLE OF PSYCHOLOGICAL OPERATIONS WITHIN THE MILITARY MISSION*

BY ALEXANDER R. ASKENASY

Psychological strategy is a major tool for realizing national goals; it requires total integration with all other activities—economic, diplomatic, and military—and, accordingly, a coordinated effort by all agencies.

It is ironic that, whereas psychologists have shown only limited interest in psychological operations, to non-psychologists the term has often evoked sinister associations with the mystique of psychology.

Psychological operations, narrowly defined in terms of leaflets and broadcasts, have often been considered a minor appendage to conventional military operations. Some writers have called in general terms for a larger role for psychological operations, but only rarely have we implemented such a role. My thesis is that in contemporary warfare, psychological operations must be integrated with other actions and that a social-psychological approach can be helpful in conceptually unifying all the diverse actions.

Clausewitz saw war as a means of changing the enemy's will or, we might say, as a form of psychological operations. As he defined it: "War is . . . an act of force to compel our adversary to do our will; . . . force . . . is thus the *means*; to impose our will upon the enemy is the *object*." ¹ He

*Excerpts from "Role of Psychological Operations Within the Military Mission," Chapter 21 in *Psychological Research in National Defense Today*, U.S. Army Behavioral Science Research Laboratory, 1967. Reprinted with the permission of the author.

stated the classical formulation of the military role: "War is mere continuation of policy by other means," and "... politics is the womb in which war is developed, in which its outlines lie hidden in a rudimentary state, like the qualities of living creatures in their embryos." ²

Clausewitz was thus precociously aware of the psychological aspects of war. The point of war is not to destroy the enemy physically but rather to make him act in harmony with our will and to change his will to the extent that he no longer opposes our national interest. If we can influence the enemy's head, we will not have to strike his arm.

Burckhardt in his *History of the Renaissance in Italy* tells of the condottieri who moved their armies like chess figures without any fighting taking place, until one commander, perceiving he would lose the battle, conceded defeat. This example is not as anachronistic as it may appear. When we think of opponents in conflict or war, we should visualize not robots hacking at each other, but human beings with constantly changing perceptions, expectations, and alternatives.

BROADENING VIEWS OF PSYCHOLOGICAL OPERATIONS

Linebarger reports that "World War I saw psychological warfare transformed from an incidental to a major military instrument . . ." ³ In his opinion, this country's psychological warfare consists in "the supplementing of normal military operations by the use of mass communications" ⁴ Its place is a modest one and its methods are limited by our usages, morality, and law." ⁵

The outstanding example of psychological operations in World War I was Woodrow Wilson's Fourteen Points which appealed, with some success, directly to the people of Germany and Austria-Hungary. During World War I, the term "propaganda" was widely employed. Later on, the term became increasingly discredited—partly by Goebbels' use of it. The United States Army substituted the term "psychological warfare," and made extensive use of this "weapon" in World War II.

At the onset of both World War II and the Korean conflicts, many psychological warfare lessons had to be relearned—a fact that points up the absence of a continuous military policy for psychological operations. In 1957, the Department of the Army replaced the term "psychological warfare" with "psychological operations," indicating a recognition that such operations do not require a formal state of war and that they are not directed solely against enemies.

Finletter argued that "Psychological warfare is a bad term because the word 'warfare' implies that deceit is justifiable if it serves our purpose, and that such a concept is neither consistent with our principles nor is it good business." ⁶

In contemporary practice, psychological operations have tended to be conducted primarily on two levels: (1) as propaganda in the traditional sense, conducted by traditional means (leaflets, broadcasts, and so forth) ⁷, and (2) more recently in specific actions (medical programs, school con-

struction, road-building) explicitly directed toward the change of attitudes and behavior of foreign populations in a direction considered desirable. On both levels, psychological operations have been viewed as subsidiary to conventional military activities.

We encounter too the not uncommon view that psychological warfare is somewhat disreputable or indecent. However that may be, the Communists are waging warfare psychologically today in places like Vietnam. As Dyer puts it, "When one looks at Soviet political communication and compares it with out own, what stands out is the completeness with which the instrument has been integrated into all forms of Soviet activity. . . . If we are to reply merely with counterpropaganda, or even propaganda, in the sense that the term carries today, we are at a disadvantage from the start."⁸

A continuing dissatisfaction with the definitions used in this area has been reflected in the changing terms from "propaganda" to "psychological warfare" to "psychological operations." Other terms have been proposed. One source lists no less than 18 such expressions.⁹ In England, the term "political warfare" came into use, meaning "combined operations of diplomacy and propaganda."¹⁰ Lasswell says, "Political warfare adds the important idea that all instruments of policy need to be properly correlated in the conduct of war."¹¹

In practice, journalists, public relations men, and advertising specialists have often been called on to conduct psychological operations. Working from trial and error, they have often done skillful, sometimes ingenious work,¹² even though their experience has usually been in the domestic communications industry. One British World War II expert concluded that "many of the techniques employed by journalists and advertisers are not applicable to propaganda operations."¹³

PSYCHOLOGICAL OPERATIONS IN CONTEMPORARY WARFARE

In contemporary warfare, the role of psychological operations increased in importance. There are two reasons:

1. As Morgenthau¹⁴ has pointed out, aristocratic internationalism has in the last 200 years been replaced by nationalisms with competing ideological claims, and increasingly wider groups have become involved in government.

2. More recently, nuclear weapons have reduced the feasibility of full-scale wars to settle policy issues. It is becoming increasingly clear that psychological operations are less costly than combat. While formerly the psychological aspects were a small part of an essentially military struggle, now, especially in a cold war, military aspects have become a relatively minor part of an essentially psychological struggle.

The so-called little wars and the insurgencies in developing countries have been recognized as crises which cannot be fought by force of arms only but which pose major political, economic, and psychological problems.¹⁵ It has become essential to win the allegiance of the civilian

population, preferably before an insurgency starts.¹⁶ Mao Tse-Tung has said that the masses must first be convinced and aroused before they can be organized. Guerrilla action can come only later.¹⁷ General Giap of the Viet Minh has similarly maintained that propaganda is more important than fighting.¹⁸

The revolution of rising expectations in developing nations cannot be contained by police action. Any long-range solution must take into account a people's national, economic, and social aspirations. The French found this to be true in Algeria. As Colonel Frequelin¹⁹ has noted, the French Army started out to control the terrain and only later became concerned with the aspirations of the population.

PSYCHOLOGICAL EFFECTS OF MILITARY OPERATIONS

General Wheeler has pointed out that the Army's mission is to conduct combat operations on land which are well understood by ourselves, by our friends, and by our enemies.²⁰ He further stressed the need for credibility and visibility of Army powers.

It may be argued that the military commander very often is not aware of the psychological implications of his conventional military operations. Yet all military actions can have psychological effects on perception and behavior whether or not the commander intended such effects. Indeed, such unintentional aspects of military operations may have a greater influence on the will to resist than do calculated schemes. Military, political, economic, and psychological actions may, then, be viewed as communications, as processes through which intentions are more or less conveyed. Psychological operations should be seen as a coordinated approach to influence the opponent's way of thinking and acting.

One shortcoming of psychological operations in developing countries is that communication is addressed primarily to the well-to-do upper or middle classes which represent the status quo, while far less attention is given to the majority of the population. As Osanka said, "the ruling powers (in underdeveloped countries) seldom view the peasants as an important or powerful political threat. Insurgents, and particularly Communist insurgents, take the opposite view"²¹ In the long run, it seems difficult to maintain the allegiance of a developing nation by relying only on the upper classes. Smith argues that, over time, the middle and upper classes have to work within the limits of the value constellation of the villagers whom they "govern," or be ousted.²²

What we need, then, is a clearer picture of the persons with whom we are communicating, the persons who play important roles in modern war and insurgency. They include not only the statesmen and military officers but also the common soldiers and the peasants, the students, and the frustrated intellectuals to whom the Communists seek to appeal.

Changing Perceptions

Cantril developed a theory which brings together perceptual research and the individual's relations to society and social movements. He holds that we must deal not only with the "objective" world surrounding a

person but also with his perceptual world—the world as *he* sees it.²³ People have lived for centuries with poverty and accepted it as unchangeable; then, suddenly, they find it intolerable and act to change it. We must concern ourselves with what has brought about this change in a people's aspirations.

A man's perceptions have developed in a given cultural and social setting. It is the task of the commander and the planner to restructure not only the "real" situation of an opponent but also the situation as the opponent perceives it. This is done not only by propaganda leaflets but also by a wide range of other means. The military commander through actions at his disposal can change not only the opponent's will to fight but also his perceptions of us and our intentions. The commander should ask himself: What do the men opposing us expect us to do? What would they like to see us do?

All too often there is a tendency to project the standards and assumptions of our own nation into the minds of people of other nations. One example of this projection is concerned with so-called "legitimacy." A nation may communicate sympathy and support to another nation for its "legitimate aspirations for freedom, progress, and peace." In effect, such a nation sets itself up as a judge of right and wrong, forgetting the views of the people concerned, many of whom may oppose their established government and may even use illegitimate means because they feel their legitimate aspirations will not be fulfilled under the status quo. Too, the concept of treason is a relative one, as Boveri pointed out in her work, *Treason in the Twentieth Century*.²⁴ A person may feel that in being loyal to the regime, he in effect betrays his nation or social group. Bauer²⁵, in an article on influence processes and resistance to communication, found need for two levels of analysis, one to account for "the intentions of the regime" and the other to explain the "intentions of the citizen."²⁶

In developing countries, where rapid technological change occurs while traditional customs persist, there is need for perceptual restructuring, for a new "definition of the situation." Communism tries to provide a ready-made doctrine which seems to explain all the disturbing changes. Communism tries to offer a common language as an aid to effective communication, to provide categories of thought, and to spread belief in the ultimate triumph of Communism as a historical necessity—a new version of "God's will."²⁷

The military commander must be concerned with what he communicates to the enemy leader. What should the enemy know? What should he not know? What impression should he get? As the enemy leader will base his plans and operations in part on his perception of our strength and of his own, what can we do to change this perception in a way favorable to us?

Perceiving the Enemy

In war, there has been traditionally a clear dichotomy between friend and foe, between the "goodies" and "baddies." Gray distinguished four

“images of the enemy”: first, as a professional colleague—a comrade in arms; second, as subhuman; third, as devil and enemy of God and the good; fourth, as essentially decent but misguided.²⁸ Osgood has repeatedly²⁹ questioned the implicit assumptions we make about our own motivations and about those of the enemy.

In a world war, it is relatively easy to create in a few years simple, endlessly repeated stereotypes. When we are trying to win over enemy soldiers or even leaders, however, it will not help to tell them that they are criminals. In guerrilla warfare, the identification of the enemy becomes increasingly difficult, and the problem of communicating with him the more complex. Who is the enemy in an insurgency in a developing nation—the guerrilla fighter, his military leader, his political leader, a foreign power, hunger, or social crisis? Our military have shown a growing awareness of this complexity by their increasing emphasis on civic actions either combined with regular military operations or as preventive measures.

In the long run, if we want to win over people who are now in opposition to our national interests, neither conventional military nor narrow psychological operations will do the trick. To find a *modus vivendi*, we must identify “the common purposes, the common interests, the common values of the free world.”³⁰ Smith³¹ suggested that the United States gradually redefine political freedom, economic security, and individual dignity in ways both we and non-industrial nations can agree on. Much of what was said about perceptions and expectations holds not only for foreigners but also for ourselves. Nor can one see communication as a one-way street for influence. Bauer advocated a “transactional model of communication, [in which] there is an exchange of values between two or more parties.”³²

Alternatives Open to the Adversary

What alternatives does the soldier or guerrilla perceive as open to him? What value priorities does he attach to these alternatives? Should he resist? What else can he do? These questions are closely related to his will to fight. Most guerrillas fight not for the sake of fighting but because they expect to reach certain goals which they feel cannot be reached by other means. Decision and game theories have not been too helpful in accounting for these processes. Values are subjective and choices are often made on emotional grounds. Nonetheless, it may be useful to think in terms of alternatives and of the probabilities and utility values attached to them.

Lerner in *The Passing of Traditional Society*³³ concluded that mass media create the psychological capacity to imagine alternative ways of life and to perceive oneself in new situations and strange roles. Psychological operations in both the narrow and the broad sense can create and change alternatives. Consider some historical cases—over-simplified, of course. President Wilson’s Fourteen Points were widely accepted by people of the Central Powers as an attractive alternative to continued fighting in World War I. In World War II, the Allied insistence on unconditional

surrender is said to have stiffened German resistance. In the Philippines, Magsaysay offered amnesty and free land to Huk guerrillas who surrendered, giving them a most desirable alternative to fighting. In Malaya, the British made surrender more appealing by using such terms for it as "leaving the jungle" or "self-renewal."

. . . . In the broad sense, psychological operations should aim at changing the opponent's perceptions so that resistance no longer appears to serve his interests. From his point of view, he acts in his own interest, which others are resisting. Psychological operations, rather than destroying the enemy, can aim at converting him to see things differently. They can persuade him that it is in his long-range interest to work with us toward a future that satisfies his hopes and expectations. Thus, a common denominator must be found which takes into account the interests of both sides. If there is a one-sided preponderance of military or other power, the formula may neglect the interests of the other side. Such an equilibrium is likely to be short-lived. As soon as the weaker side gains strength—or perceives itself as having gained strength—it is likely to challenge the status quo. Therefore, long-range stability tends to require the acknowledgement of national interests as perceived by both nations involved.

COORDINATION OF MILITARY AND CIVIC ACTIVITIES

Just as the U. S. Army has shown its flexibility in developing new units, training methods, and doctrine for unconventional warfare, so it can adapt to the demands for extended psychological operations in contemporary warfare and insurgencies. The military commander in the field should be able to coordinate psychological and standard military operations, to plan and recommend military activities not only in terms of immediate military results, but also for psychological effect, both immediate and long-range. Magsaysay in the Philippines gave an impressive example of efficiently integrated military and psychological operations.

Although coordination of operations by the Army and other government agencies for psychological effectiveness has long been practiced, some specialists hold that such coordination has at times been incompletely achieved. Crossman for one has warned that "...psychological warfare may do more harm than good unless it is strictly coordinated with diplomatic and military activity."³⁴

For efficient psychological operations, the military—and, for that matter, the political—decision makers must see their actions as a united whole. Even though different activities have been assigned to different government agencies, it would be dangerous to assume that the psychological processes involved fall into corresponding separate slots rather than being unitary and continuous. The Communists have been quite aware of this danger and have acted accordingly. We would neglect this unit at our own risk.

In order to conduct and maintain effective military and psychological operations, personnel must be sensitized to the psychological implications

of potential actions. Some such sensitizing training should be given not only to explicitly labeled psychological operations officers but also to commanders who make important decisions and to troops who are in contact with foreign populations.

CHAPTER III

NATIONAL POLICY AND PSYOP

Who is responsible for the formulation of foreign policy? Who can claim credit—or should share blame—for policies relating to PSYOP? How is policy formulated? How are competing policy recommendations forged into a single, coherent foreign policy for effective psychological operations? What are the interrelationships of the various departments and agencies, in the Washington PSYOP community and overseas—in policy formulation and in policy implementation (day-to-day operations)? Are there procedural conditions that policy should meet in order to facilitate implementation? What are the most important limitations on policy planning that public pressures create? These are some of the recurrent issues into which this chapter inquires.

The essays that follow seek to explain historical and contemporary aspects of the national policy process in PSYOP. From these essays, certain propositions regarding the framework within which national PSYOP policy is formulated, administered, and implemented emerge. The authors suggest that PSYOP can truly support national objectives only if it receives firm encouragement at the highest levels of government; the superordinate PSYOP apparatus must be specialized and linked in a direct relationship to the key national policymaking machinery if the psychological dimension is to be fully considered in international policy decisions; the PSYOP planning apparatus must wield firm power over all implementing agencies and departments if the information effort, long term as well as short term, is to be fully controlled and coordinated; and PSYOP planners as well as other policymaking leaders in a democracy must consider the role of the panoply of information media and the relationships between domestic attitudes and international policy.

NATIONAL POLICY AND PSYOP: THE FRAMEWORK FOR POLICY

Although the United States has undertaken psychological initiatives in foreign and military policy since the beginnings of the Republic, systematic planning for PSYOP policy was largely neglected until World War II. Since World War II, how—and even whether—the procedures and mechanisms required for overall PSYOP planning can be accommodated with the national policy framework have been debated. Nevertheless, it is clear that U.S. departments and agencies, as well as the U.S. Congress, are now more acutely aware of the psychological factor in national security planning than in the past, and this is reflected in the attention that psychological considerations have received beginning in the 1960s to the present time.

Much has been written about the national policy structure. In contrast, few writers have explored the national structure in the context of the framing of policy and doctrine for PSYOP. As in any dynamic system, full

comprehension of the framework involves the consideration of interactions:

1. the formal organization for policy formulation and administration
2. the informal relationships between agencies and individuals that determine how policy will be implemented
3. the structure of relations between institutions, and
4. the public environment which influences policy formation and articulation.

The central forum for interagency coordination in the early 1970s was the National Security Council (NSC). How adequately the NSC system could and did execute its functions within the existing framework, however, remained a matter of current debate. Some asserted that information agencies still did not interact in a fashion to insure a coordinated communication effort.

Whatever the circumstances, even the most elaborate organizations will not arrest the development of informal relationships, for they, too, fill important needs. And these needs must likewise be considered within the framework.

Any explanation of the development of informal processes must take into account the general institutional slowness in adapting to new circumstances and in recognizing and utilizing special competence in unforeseen situations. Another part of the explanation involves consideration of the power relations between departments and agencies as well as within them. If used wisely, informal processes can lead to a more flexible program; if used excessively, they can lead to a splintered, fragmented communication effort.

PSYOP IN PERSPECTIVE*

BY WILLIAM E. DAUGHERTY

The international information program of the United States requires a specialized organization for both long-term and short-term objectives. This article provides an historical evaluation of U.S. PSYOP.

BACKGROUND

Psychological Operations (PSYOP) as defined in recent doctrine is not new, either to the armies of history or within the U.S. civilian or military establishment. It has been well documented that leaders of all ages have employed, often on a hit-and-miss basis, techniques which we describe as PSYOP. To paraphrase a senior American Army colonel long experienced in the employment of PSYOP, "In the past successful leaders have always used it—albeit such actions were most often done by charismatic personalities or their inspired and viscerally attuned lieutenants who recognized opportunities by some indefinable quality that they seldom understood and rarely could explain to others. In the past the situations of conflict were normally more clearly defined. The enemy was most frequently identifiable. The slower reaction times that were allowed permit-

*Original essay by William E. Daugherty.

ted a higher degree of centralization of political/psychological tactics.” However, the situations and environments that U.S. strategic forces—civilian as well as military—have faced in the recent past are believed to be vastly different from those encountered earlier in our history. Yet, we do not know very accurately the scope and nature of the differences as they relate to PSYOP—when, where and how to employ it.

It has only been within the past two decades that the executive branch of the U.S. government and the military services have structured a PSYOP-international information effort on anything other than short-range plans and *ad hoc* improvisations. Although psychological warfare (PSYWAR), as it was called in World War II, was widely used, it was neither well understood nor universally accepted among the nation’s top civilian and military leaders. At the end of World War II there were no widespread demands for a written history of how it was employed, or what successes or failures could be attributed to its use. The several civilian information agencies active overseas during the war were greatly reduced in size in 1945 and merged into a small interim branch of the State Department. This activity, then labeled as international information, was not given statutory authority until 1948, and even then it was provided only limited personnel resources and a begrudging acceptance by the parent agency, the Department of State. The USIA, the civilian agency created especially to conduct the nation’s strategic international information programs, was not established until 1953.

Since it was established as an independent agency in 1953, the USIA has had a relatively uneven but steady growth and expansion as may be judged by the size of its personnel roster today, the nature and range of its activities, and the power that has been given to it on at least two occasions within the past decade to coordinate the joint civilian agency, military services PSYOP, and international information programs in overseas areas.

Within the military services, the development of a PSYOP capability since the end of World War II has been spectacular. Yet, this growth has not been consistent throughout the services. It is doubtful whether anyone has a very clear picture what the overall national capability is or how the PSYOP capability of any one of the several services can seriously affect the other services or missions of the nation.

PSYWAR FOLLOWING WORLD WAR II

At the end of World War II only the Navy of all the military services made an immediate attempt to assess the lessons it had learned from its employment of what was then called PSYWAR. The Army did not get around to a comparable effort until over five years later, when a contract research agency was asked to undertake aspects of this task. Of the several American civilian agencies that were engaged in the dissemination of the American story overseas during the war, only that agency headed by Nelson Rockefeller, The Office of the Coordinator of Inter-American Affairs, ever succeeded in bringing out a history of the lessons

learned in disseminating information overseas. The Office of War Information, the Coordinator of Information, the Office of Strategic Services, the U.S. Army—none of these operations ever produced a history of comparable scope. There were a few privately sponsored studies dealing with specific aspects of PSYOP or foreign information activity but these were limited in their coverage. Daniel Lerner's *Sykewar: Psychological Warfare Against Germany D-Day to VE-Day* (1949), and Charles A. H. Thomson's *Overseas Information Service of the U.S. Government* (1948) were perhaps the most important of the earlier detailed accounts, along with William E. Daugherty, "Psychological Warfare in American History," *A Psychological Warfare Casebook*, ed. William E. Daugherty and Morris Janowitz (Baltimore, Md.: The Johns Hopkins Press, 1958), pp. 59–118 and Paul M. A. Linebarger's *Psychological Warfare* (1948), which was somewhat more general in character.

At the end of World War II all PSYWAR personnel in the military services—staff officers as well as unit personnel—were either retired to an inactive status in the nation's strategic reserve, or, if they remained on active duty in the armed services, they were assigned to other military responsibilities. When the U.S. military forces were ordered into Korea in the summer of 1950 by President Truman, the Army at that time had no existing plans, no accepted doctrine, nor even trained units to provide U.S. troops PSYWAR support.

PSYWAR AND KOREA

To meet the challenges of the moment in Korea it was necessary for personnel assigned occupation duties in Japan to improvise PSYWAR on a day-to-day basis. Those individuals who were placed in charge of the activity in the Far East Command (FEC) in Tokyo had very little precedent to guide them. They received few directives from higher headquarters and they possessed what is now believed to have been an all-too-limited vision of how and for what purposes PSYOP might be effectively employed. For the first seven months of the conflict, the FEC PSYOP effort in Korea itself was confined largely to one man, a lieutenant colonel operating in a liaison capacity for the FEC at Eighth Army Headquarters (EUSAK). No operational PSYOP personnel were assigned anywhere within the EUSAK until late January 1951, seven months after the war began.

EMERGENCE OF PSYWAR OFFICE

At Army headquarters in Washington and throughout CONUS, developments were likewise late. Indeed, not until the end of the first year of the Korean conflict did the Army, for the first time in its history, create a special staff agency, the Office of the Chief of Psychological Warfare (OCPW), to plan, supervise, and guide the development of doctrine, organization, and training facilities in this heretofore unstructured ad hoc field of activity. The predecessors to the present-day Army PSYOP units—companies, battalions, and groups—were first established in 1951 and were created in response to crash planning. The present day

JFK Center for Military Assistance, with its subordinate schools, can trace its beginning back to 1951 when a military PSYWAR course was first structured and given under the auspices of the Army General School, at Fort Riley, Kansas. In 1952, there was created at Fort Bragg, North Carolina, a PSYWAR Center, a PSYWAR School, and a PSYWAR Board, to train and equip personnel and to study Army needs and crystallize PSYWAR doctrine. To this center the personnel of the PSYWAR Department at the Army General School, Fort Riley, Kansas, were transferred in 1952.

During the 1950s a number of significant changes affecting PSYWAR took place both at Army headquarters in Washington and at Fort Bragg. In the course of time, other activities and functions were assigned to the OCPW. These included: first, the activities of special forces personnel and later, other cold war functions and activities variously described as unconventional warfare, special warfare, and counterinsurgency planning and operations. As additional functions and duties were transferred to the OCPW, there came an urge to label both the function and the offices responsible for their supervision by new names. Thus, in time, the term "Special Warfare" replaced the term "Psychological Warfare" in the title of the special staff section responsible for that function on the Army staff. At Fort Bragg, in time, the PSYWAR Center and School became the Special Warfare Center and School. As a consequence of such Army thinking, the center broadened its mission to provide for the training of Special Forces personnel and units.

In the last years of the 1950s the term PSYOP came into American Army parlance, not to replace the term PSYWAR, but rather to provide Americans with a broader term that would more accurately characterize the changing concepts that Army personnel were gradually accepting. In the first years of the 1960s further changes were made at the Army headquarters and at the center at Fort Bragg.

FUNCTIONAL CHANGES OF PSYWAR BETWEEN WORLD WAR II AND VIETNAM

In World War II, in most Army commands and military theaters, PSYWAR was viewed as a specialized activity of military intelligence. The major exception to this was in General Eisenhower's Supreme Headquarters Allied Expeditionary Forces (SHAEF) command. During the first seven months of Korean conflict, PSYWAR in the FEC Headquarters and within EUSAK was administered by intelligence personnel. In the eighth month of that conflict the responsibility in EUSAK was transferred from G-2 to G-3. The following June, a year after the American initial involvement in Korea, PSYWAR was divorced from G-2 and made a special staff section at FEC Headquarters, Tokyo.

In 1951, the establishment of OCPW at Army headquarters in Washington as a special staff section suggests that the activity encompassed by the term "PSYWAR" was viewed at that time as a special or subsidiary type of activity, not as an element of operational strategy.

However, as U.S. Army personnel gained more experience in PSYWAR and gave more thought to its use, the activity came to be viewed more and more as a G-3 function, not as a separate or subsidiary exercise of G-2.

To insure that PSYOP plans and operations were integrated more completely into overall military planning and operations, the functions of the Office of the Chief of Special Warfare (OCSW), as OCPW in time came to be called, were transferred approximately a decade ago to the Office of the Deputy Chief of Staff for Military Operations (ODCSOPS). During most of the 1960s these functions were supervised by a director of either Special Warfare, or Special Operations as a part of ODCSOPS. As additional experience in its use was accumulated, and more and more officers came to view PSYOP as a specialized field of military operations, the responsibility for the supervision of PSYOP functions, on behalf of DCSOPS, was transferred from the chief of a directorate—to the chief of a component division of a directorate. Thus from 1967 on, ODCSOPS PSYOP functions were administered by the chief of the PSYOP Division in the International and Civil Affairs Directorate.

As a result of experience gained in South Vietnam, reports submitted by two ad hoc study groups in 1966 and 1967 and a recommendation of an Army board, established in 1966 to study Army training requirements (the Haines Board), PSYOP came to be viewed more and more in the context of a cluster of related activities that required personnel with similar specialized training, not heretofore provided in any depth, in formal courses of instruction in the Army school system. These evolving views with respect to PSYOP are reflected in a number of significant changes made between 1965 and 1969 in Army doctrine and organization at Army headquarters in Washington, at Fort Bragg, North Carolina, and overseas in such operations at the military involvement in the Dominican Republic crisis and the escalation of operations in South Vietnam.

DEVELOPMENT OF CURRENT PSYOP ORGANIZATION

In the middle years of the 1960s, courses of instruction were established at Fort Bragg to provide training in such PSYOP-related functions as military assistance; counterinsurgency, later described as stability operations; and in techniques applicable to military advisory personnel assigned to work with host country counterparts. Overseas, in both South Vietnam and the Dominican Republic, by presidential order, the supervision of joint international information-PSYOP activities were placed under the guidance of a senior officer of the United States Information Agency. Military PSYOP units and civilian personnel of the USIA were required to learn in an ad hoc-type of situation and organization how to work together in a common PSYOP-information program effort. In the course of time many of the hastily improvised arrangements became standard operating procedure not because they worked effectively, but because they provided the least friction. Thus, two different types of

agencies—one military, the other civilian—with disparate missions, organizational concepts, and operational facilities, forged through trial-and-error processes of learning through doing, have fashioned the PSYOP organization and arrangements that exist in South Vietnam today.

Recent changes and long term trends in American PSYOP doctrine and policy show clearly the growing breadth of the concept of psychological operations. In conjunction with those changes there has arisen a need for new organizational and management techniques to bring policy planning and implementation into line with the broader conceptual schema.

THE NATIONAL PSYOP COMMUNITY

BY THE EDITORS

A description of the current structure of the national security system as it relates to PSYOP in which a general trend toward a greater understanding and appreciation of PSYOP is noted.

INTRODUCTION

An increasing importance is being attached to the employment of psychological operations, or PSYOP, in the support of national policy abroad. In fact, the Department of Defense has defined national strategy as "The art and science of developing and using the political, economic, and psychological powers of a nation, together with its armed forces, during peace and war, to secure national objectives."¹ This commentary, prepared by the editors, describes the framework of PSYOP at the national level as it exists as an element of U.S. national strategy in the current international environment of cooperation and conflict.

As a result of the separation of powers provided for in the Constitution of the United States, the formulation and administration of national security policy are responsibilities of the executive branch of the U.S. Government, and, ultimately, of the president. Each executive agency and department tends to define its mission and functions broadly in order to utilize all available resources and exercise control over as many variables as possible in supporting the achievement of departmental objectives. Thus, a major consideration for the president is the rationalization of decisionmaking—the organization and allocation of responsibilities among agencies to reduce overlaps and gaps and to systematize inter-agency coordination where it is necessary.

Although the structure of the national PSYOP community—as it is now constituted in the early 1970s—is largely an ad hoc one representing departments and agencies as their interests are affected, the constituent parts of the community may be divided into two groups—those with principal and continuing roles in PSYOP, and those with important, but occasional interests. The second group will not be discussed here, although those departments may have key roles in the decisionmaking on specific issues. The agencies and departments with continuing interest in PSYOP constitute the major part of the PSYOP framework at the national level and include the National Security Council and its supporting

structure, the Department of State, the U.S. Information Agency (USIA)*, the Agency for International Development (AID), and the Department of Defense (DOD).

THE NATIONAL SECURITY COUNCIL

Established by the National Security Act of 1947 (as amended), the National Security Council (NSC) advises the president with respect to the integration of domestic, foreign, and military policies relating to national security. The president has designated the NSC as the principal forum for the consideration of national security policy issues requiring a presidential decision.²

Although the council itself is composed of the president, the vice president, the secretaries of state and defense, and the director of the Office of Emergency Preparedness (OEP), the NSC proper is in reality the highest level of a much larger decision-making system that operates at the direction of the council (and therefore of the president). The NSC staff, including the Office of the Assistant to the President for National Security Affairs, the secretariat, an operations staff, a planning group, and a program analysis staff, is supervised by a civilian executive secretary appointed by the president. Major organizational components of the NSC system are the Senior Review Group, the Under Secretaries Committee, NSC Interdepartmental Groups (IG) (and their subordinate working groups), the Washington Special Actions Group (WSAG), the Defense Program Review Committee, the Verification Panel, the NSC Intelligence Committee, and various other ad hoc committees appointed by the president to deal with specific problems.³

Other NSC members may propose the inclusion of items on the agenda, but the assistant to the president for national security affairs, at the president's direction, and in consultation with the state and defense secretaries, has the primary responsibility for determining the NSC agenda and for supervising the preparation of the necessary papers.

When in January 1969, at the direction of the president, the NSC system was substantially reorganized along the lines described in this essay, two new memoranda series were established—the National Security Decision Memoranda (NSDM) to report presidential decisions and the National Security Study Memoranda (NSSM) to direct the undertaking of studies for the NSC system.⁴

The NSC Senior Review Group examines papers coming out of the NSC groups and committees or from the departments prior to their submission to the NSC. Chaired by the assistant to the president for national security affairs, the review group includes representatives of the secretary of state, the secretary of defense, the director of the Central Intelligence Agency (CIA), the chairman of the Joint Chiefs of Staff

* Most overseas activities of the USIA, however, are conducted by overseas posts known collectively as the U.S. Information Service (USIS). (See section on USIA Overseas Operations.)

(JCS), and other agencies at the discretion of the chairman. It reviews the papers submitted to insure that: (1) the issue under consideration is worthy of NSC attention, (2) all realistic alternatives are presented, and (3) the facts (including the cost implications and views of all departments and agencies concerned) are fairly and adequately set forth. Action may then be assigned by the NSC Senior Review Group to the NSC Interdepartmental Groups, to the NSC ad hoc groups or committees, or to the Under Secretaries Committee.⁵

The NSC Under Secretaries Committee is a deliberative body in which issues are usually presented in a formal way. Chaired by the under secretary of state, assisted by the undersecretary for political affairs who acts as his alternate, the Under Secretaries Committee consists of the deputy secretary of defense, the assistant to the president for national security affairs, the director of the CIA, the chairman of the JCS, and, depending on the issues under consideration, and at the discretion of the chairman, ranking officers of other agencies. The NSC Under Secretaries Committee considers:

- issues referred to it by the NSC Senior Review Group;
- operational matters pertaining to interdepartmental activities of the U.S. Government overseas:
 - on which NSC Interdepartmental Groups have been unable to reach an agreement and which are of a broader nature than is suitable for any such group;
 - which do not require consideration at the NSC or presidential level, and which are referred to it by secretary of state; and
 - other operational matters referred to it jointly by the under secretary of state and the assistant to the president for national security affairs.⁶ In effect the Under Secretaries committee was intended to be the group that receives the truly significant problems from all the intermediate bodies and also an implementing body to carry out many presidential directives. However, the committee has lapsed in importance in large measure.⁷

The Interdepartmental Groups (IGs) are the basic elements of the NSC system. Organized on a geographical and functional basis and chaired by the appropriate assistant secretary of state, IGs include in their membership the appropriate assistant secretary of state, representatives of the assistant to the president for national security affairs, of the office of the secretary of defense, of the CIA, and of the JCS, as well as of other agencies at the discretion of the chairman. IG responsibilities include:

- discussion of and decision on interdepartmental issues that can be settled at the assistant secretary level, including those arising out of the implementation of NSC decisions;
- preparation of policy papers for consideration by the NSC; and
- preparation of contingency papers on potential crisis areas for NSC review.⁸

The Defense Program Review Committee (DPRC) is chaired by the assistant to the president for national security affairs and includes as members the under secretary of state, the deputy secretary of defense, the JCS chairman, the CIA director, director of the Office of Management and Budget (OMB), chairman of the Council of Economic Advisors (CEA), Arms Control and Disarmament Agency (ACDA) chairman, science advisor to the president, and chairman of the Atomic Energy Commission (AEC). In its role as arbiter for the allocation of resources, the DPRC reviews and considers those major defense policy and program issues that have diplomatic, economic, political, and strategic implications in relation to overall priorities for the goals and use of national resources.⁹

The Washington Special Actions Group (WSAG), another high-level group within the NSC system, endeavors to remain current on possible crises and to develop options for various stages of an international problem. It is essentially the White House operations center for crises. The WSAG, usually a small committee, is chaired by the assistant to the president for national security affairs and includes the deputy secretary of defense or assistant secretary of defense for international security affairs (ISA), director of the CIA, chairman of the JCS, and the under secretary of state. However, membership expands as circumstances require.¹⁰ WSAG is responsible also for anticipating future crises, for reviewing contingency plans prepared by the IGs, and for developing options for NSC consideration.

Also included in the NSC system are the Intelligence Committee, the Vietnam Special Studies Working Group, the Verification Panel (a policy and study group for arms control), and numerous other subgroups and ad hoc bodies.

In brief, almost all major issues of national security are now processed through the NSC mechanism. For example, the president, his assistant for national security affairs, the NSC staff, or an interested department or agency might raise a question or problem pertaining to U.S. PSYOP. The matter would be routed to the presidential assistant and the NSC staff to be formalized in a NSSM directing that a study of the matter be undertaken. Copies of the NSSM would be sent both to the NSC staff, which generates its own data and arguments, and to the departments or agencies involved. In turn, the NSSM would be assigned for action to and considered by, an appropriate NSC interdepartmental group or an ad hoc committee. In all likelihood, in this case it would be sent to an ad hoc PSYOP committee. The committee would then produce a "basic paper" that would go to the NSC Senior Review Group for finishing touches before being presented to the NSC by the assistant to the president. The president would personally make the decision in accordance with his constitutional responsibilities. The decision finally would be transmitted in writing in a NSDM, and the NSC Under Secretaries Committee would begin overseeing its implementation.

THE DEPARTMENT OF STATE

Washington Level Operations

Although the president has the overall responsibility for the foreign policy of the United States, the secretary of state is his principal foreign policy advisor and has responsibility for the execution of foreign policy in accordance with approved policy. The secretary of state also has full authority and responsibility for the overall direction, coordination, and supervision of interdepartmental activities of the U.S. Government overseas. This authority includes the continuous supervision and general direction of economic assistance and military assistance and sales programs as provided in the Foreign Assistance Act of 1961 (as amended). The authority does not extend to:

- The activities of U.S. military forces operating in the field where such forces are under command of a U.S. area military commander,
- such other military activities as the president elects to conduct through military channels, or
- activities that are internal to the execution and administration of the approved programs of a single department or agency and that will not significantly affect the overall U.S. program in a foreign country or region.

The State Department also has previously established responsibilities, by virtue of law or executive order, with respect to such matters as: information activities, international educational and cultural affairs, foreign assistance, food for peace, arms control and disarmament, supervision of programs authorized by the Peace Corps Act, social science research, and immigration and refugee assistance.

In providing overall foreign policy guidance, the State Department also coordinates and supervises U.S. resources in the conduct of propaganda and political warfare. The U.S. Information Agency, as will be noted later, conducts overt mass communications and provides policy guidance on the conduct of PSYOP in accordance with the basic foreign policy guidance it receives from the State Department.

The secretary of state is also in charge of the day-to-day operations of the department, including the Foreign Service. A member of the cabinet and of the NSC, he uses the system of NSC Interdepartmental Groups and the Under Secretaries Committee in the implementation of his responsibilities for foreign policy and U.S. activities overseas. Within the purview of these responsibilities the secretary of state delegates executive authority to the chairmen of these committees.

The under secretary of state is the secretary's full deputy and serves as acting secretary in his absence. As the principal advisor to the secretary, he (1) assists in formulating U.S. foreign policy and in providing overall direction to all the elements of the State Department, (2) participates in the NSC meetings, (3) serves as the chairman of the NSC Under Secretaries Committee, and (4) oversees the department's participation in the NSC system. Assisting the secretary and the under secretary are the

under secretary for political affairs, the deputy secretaries for political affairs and for economic affairs, and the ambassadors at large.¹¹

To improve the effectiveness of the department in supporting the role of the secretary of state as the president's principal foreign affairs advisor and as a NSC member and to strengthen the policy planning and coordination responsibilities of the senior levels of the department, a Planning and Coordination Staff responsible to the secretary was established in 1969. The staff furnishes policy support to the secretary and his principal associates, the Under Secretaries Committee, and other elements of the NSC system, including the NSC Senior Review Group and the IGs. It also performs the function of the former Policy Planning Council and relates long-range policy to current operations.¹²

To provide improved management and policy guidance to the department in politico-military affairs, the department elevated its Office of Politico-Military Affairs to the status of a bureau in September 1969. The bureau is responsible for liaison with the Department of Defense (DOD) in the coordination of foreign and defense policies, as well as for support of senior State Department officers in relationships with the secretary of defense and the JCS.¹³

Five assistant secretaries direct the activities of the geographic bureaus. For the countries within his geographical area, each assistant secretary has the primary responsibility to keep the secretary of state informed of important developments, to advise the secretary in the formulation of U.S. policies, to guide the operations of the U.S. diplomatic establishments, and to direct, coordinate, and supervise interdepartmental and interagency matters.

The regional assistant secretaries also serve as the chairmen of IGs in the NSC system, as previously outlined. These groups discuss and decide issues that can be settled at the assistant secretary level, including those arising out of the implementation of NSC decisions. They prepare policy papers for consideration by the council and contingency papers on potential crisis areas for NSC review.

Each assistant secretary is aided by country directors within his bureau who are responsible for the overall guidance and interdepartmental coordination with respect to their assigned countries. Country directors are the single focal point in Washington serving the needs of the U.S. ambassadors. They work closely with "country teams" in U.S. missions abroad to insure that all elements of a mission in a given country jointly pursue U.S. foreign policy directives.

Within the department, at Washington level, no one specific office, bureau, or agency has a central responsibility for day-to-day PSYOP. PSYOP matters are handled between the regional or country directors or desk officers and the various embassies.¹⁴

Department of State Overseas Operations

As representatives of the president and acting on his behalf, the chiefs of diplomatic missions in foreign countries exercise a positive authority for the direction, coordination, and supervision of all U.S. Government

activities in their respective countries. In a letter to ambassadors in December 1969 concerning their responsibilities, the president reemphasized their roles as his personal representatives abroad and directed them to coordinate the work of all elements of the U.S. diplomatic missions. He said he expected that they would use this mandate not only to provide firm policy leadership but also to assure positive direction of all U.S. activities overseas.¹⁵

THE UNITED STATES INFORMATION AGENCY (USIA)

USIA was established as one of the independent agencies of the executive branch of the government by the President's Reorganization Plan No. 8, as approved by Congress, on August 1, 1953. The U.S. Congress has taken a very active and decisive interest in the agency's activities from its inception and, in effect, has barred it from any domestic propagandizing.

In short, the role of the agency is to support the foreign policy of the United States by explaining it to the people in other countries; to build overseas understanding of U.S. institutions and culture; and to advise the U.S. Government on public opinion abroad and its implications for U.S. policy.¹⁶ The manner in which the USIA performs these functions has been the subject of continuing debate over the years.

The Washington Level of USIA

The agency receives guidance on U.S. policy from the president and the secretary of state. The director of USIA, appointed by the president with the advice and consent of the U.S. Senate, is responsible directly to the president.

Some of the past directors of the agency have participated directly in NSC meetings; others have only had seats in the background. Currently, although the director is not a member of the NSC, he does participate in the NSC Under Secretaries Committee, and the agency also is represented in the NSC Review Group and the regular staff meeting of the secretary of state.¹⁷

USIA output must accurately reflect and persuasively support national policy. In this the director receives support from both the deputy director and the Office of Policy and Plans (IOP). IOP is also responsible for providing the director advice on the implications of foreign opinion for U.S. foreign policy.

This office also formulates basic information policies for the agency and assures that they are reflected in the agency's output. It prepares guidance on information policy for operating elements of the agency, based on briefings and background information received through liaison with the White House, the departments of state and defense, and other government agencies and private organizations. It issues guidelines for the preparation of planning documents by USIA elements and by overseas posts and reviews the plans to assure that overseas operations are consistent with established policy objectives and that resources are allocated in accordance with agency priorities.

Systematic evaluation of agency operations to insure that they serve program objectives with maximum efficiency is the responsibility of the Office of Research and Assessment (IOR). It provides the agency with a single element responsible for the assessment of products and operations, and it supervises and coordinates the work of the research service, the inspection and audit staff, the evaluation and analysis staff, the agency library, and the historian. Through sample surveys and other methods of empirical research, the research service provides information on foreign opinion relevant to U.S. foreign policy and to the agency's mandate; describes the channels of communication most likely to reach influential audiences abroad; and assesses the reach and impact of specific USIS¹⁸ programs (See section on USIA *Overseas Operations* for explanation of USIA/USIS relationship.) It keeps abreast of foreign press reactions to U.S. actions and policies and reports on the activities of foreign information services.

The assistant directors of the agency for the seven geographic areas (Africa, East Asia and Pacific, Soviet Union and East Europe, Latin America, Near East and North Africa, South Asia, and West Europe) are the director's principal advisors on all programs in or directed to countries in these areas. They help to formulate information policies and represent the director in interagency groups. They spend a large part of their time in the countries of their geographic region. These assistant directors are responsible for the direction, coordination, and management of information programs for the countries of their geographic areas. Moreover, they supply a knowledge of field problems and requirements to the agency's policy and planning processes; they arrange with media services to provide media products to their areas; and they consult with appropriate area and country officers in the State Department, AID, and with other agencies on operational matters of mutual concern.

The agency's media output must be of the highest professional standard. Thus, the assistant directors in charge of the four Washington media services are responsible to the director for the quality and persuasiveness of their output. They work with IOP and the area assistant directors to provide media products that will help advance U.S. foreign policies generally and specifically in each area. The four media services—Broadcasting (the Voice of America), the Information Center Service, Screen Service (Motion Picture and Television), and Press and Publications—provide materials to USIS posts abroad for use or adaptation by the posts. Other media products are acquired or produced locally by the posts.

Relationships with Other Agencies and Departments¹⁹

The Washington agency's principal relationships are with the State Department, DOD, AID, the Department of Commerce, the Department of Labor, and the Smithsonian Institution.

●*State Department.* As noted above, the agency director attends regular staff meetings of the secretary of state and participates in the Under

Secretaries Committee. This is not by any means the extent of inter-departmental cooperation with the State Department, however. The deputy director and the deputy director (Policy and Plans), for example, respectively (1) represent the agency on the Government Advisory Committee on International Book Programs, and (2) supervise continuing liaison with the Office of the Deputy Under Secretary for Political Affairs, the policy planning and coordinating staff, the Bureau of Public Affairs, the Bureau of Educational and Cultural Affairs, and the Office of News. Both the deputy director and the deputy director (Policy and Plans) represent the agency on the Board of the Foreign Service. The assistant directors of the agency for the geographic regions are members of the IG and maintain direct liaison with their counterpart geographic bureaus in the State Department. The assistant director, USIA (Information Centers), is a member of the Interagency Book Committee.

●*Department of Commerce.* USIA allocates Special International Exhibition funds to the department to operate a program under which trade missions (with primarily commercial objectives) are sent abroad.

●*Department of Labor.* Labor exhibits and missions are operated by the department with USIA guidance and with Special International Exhibition funds allocated by the agency. These exhibits and accompanying missions are presented independently or in conjunction with some of USIA's national exhibitions at international fairs. The labor missions work closely with USIS staffs in the field.

The president has also made USIA responsible for coordinating the plans and programs of all other U.S. agencies engaged directly or indirectly in overseas exhibits. This is done through the Interagency Exhibits Committee, which is chaired by USIA. Representatives from the Departments of State, Commerce, Labor, Agriculture, Defense, and Health, Education and Welfare, and from the Atomic Energy Commission, NASA, the Federal Aviation Agency, and the Smithsonian Institution form the committee. Representatives of other agencies also are invited to participate in the deliberations of this committee as might be appropriate.

●*Smithsonian Institution.* The Smithsonian Institution is responsible, except in the Soviet Union and Eastern Europe, for the conduct of a program of International Exchange of Fine Arts Exhibits. This program encompasses only exhibits in the fine and decorative arts—that is, painting, sculpture, prints, folk arts, crafts, and related categories. Other elements of the agency work closely on a continuing basis with their counterparts in the State Department.

Responsibility for overseas administration of the Exchange of Persons Program, the Cultural Presentation Program, the American Specialist Program, and other educational and cultural activities of the State Department lies with USIA. The State Department, however, performs substantially all administrative housekeeping functions for USIA's overseas installations.

●*Department of Defense.* The agency works with DOD, particularly the Office of the Assistant Secretary of Defense for Public Affairs. USIA advises on foreign psychological aspects of public statements and actions in the defense field and works directly with the various services in Washington and commands abroad to increase psychological support for U.S. policies.

●*Agency for International Development.* USIA advises AID on the implications of foreign public opinion for present and contemplated AID programs. The presidential statement of USIS's mission requires AID to consult with USIA when programs affecting communications media in other countries are contemplated. Both in Washington and at posts abroad, the two agencies work together to assure USIA's effective support for U.S. assistance programs, and, conversely, to insure that AID programs effectively support U.S. psychological objectives. The statement also required USIA to service USIS field requests in these categories insofar as possible. The State Department and USIA provide policy guidance to the Smithsonian Institution on international relations and psychological factors, respectively, that influence the program.

USIA is responsible for all national exhibits, including those in the fine arts, that are presented in the Soviet Union and in Eastern European countries under cultural exchange agreements.

In addition to the major contacts described above, USIA briefs representatives of all government organizations operating overseas on U.S. Government informational policies and objectives by supplying policy documents and training programs and by individually briefing key personnel.

USIA Overseas Operations

USIA staffs abroad, acting under the supervision of the chiefs of mission, are responsible for the conduct of overt public information, public relations and cultural activities—that is, those activities intended to inform or influence foreign public opinion—for agencies of the U.S. Government other than DOD commands.

Overseas, USIA vests maximum practicable authority for the conduct of the information program in the public affairs officer (PAO) in charge of the program in each country. Certain overseas installations, such as the radio relay stations, programming centers and monitoring offices, press regional service centers in Manila, Beirut, and Mexico City, and the Regional Exhibits Center in Vienna are actually operating extensions of the Washington media services.

But the largest part of all USIA activities is the United States Information Service (USIS). The term "USIS" antedates the Smith-Mundt Act of 1953, which set up USIA, and is applied to the overseas operations of USIA that are not extensions of Washington media services. "USIS" refers to the overseas post that evolves the program suited to its particular problems, decides on use of specific material, and operates the country information and cultural programs. Posts are required to assess

annually their country plan objectives and their progress. USIA maintains USIS mission posts, branch posts, subposts, reading rooms, and binational centers.

The USIS mission carries out the agency's programs and administers the Exchange of Persons Program for the State Department in each country. USIS operates as an integral part of the U.S. diplomatic mission in each country. The public affairs officer receives general program direction from and reports to the assistant director of the appropriate area in Washington. He is a member of the U.S. country team that is coordinated in each country by the chief of the diplomatic mission (ambassador or minister). Thus, the PAO also reports his activities to, and clears new programs with, the chief of mission who supervises all U.S. Government activities in his country of assignment. USIS operations in some countries are conducted at consulates and at outposts in consular districts as well as at the principal post.

Each country PAO is assisted by a staff of American and foreign national employees (referred to as local employees). The supervisory staff, which varies with the size and scope of the country program, generally includes a cultural affairs officers and an information officer in addition to subordinate Americans. They plan, coordinate, and supervise programming and maintain active personal contact with government officials, media representatives, and academic and business figures important to USIS interests.

The USIA techniques of communication and persuasion are used selectively from country to country, under country plans devised to help achieve U.S. objectives in each country. Country plans are prepared by the PAO and approved by the chief of mission with the advice of his country team. Upon approval by USIA in Washington, they become binding statements of the USIS country programs.

Each country plan lists established U.S. objectives for the country. Those objectives that are susceptible or partially susceptible to furtherance by information and cultural programs are identified, and the USIS capability to help achieve each such objective is explained. From this analysis, each post determines its psychological objectives—that is, those attitudes to be created or strengthened to advance particular U.S. objectives. Also indicated in the country plan are the people or groups who should be influenced—the target audiences—as well as detailed programs by which USIS will undertake to create or strengthen within these specific groups the attitudes the United States seeks to inculcate—the psychological objectives. These country plans are revised as often as necessary to serve as accurate, effective guides to USIS media support and field activities.

The relative emphasis on media to be used varies greatly from country to country. In one, films may be important; in another, not at all. Each program is tailored to the psychological objectives, audiences, and the

means of communication best suited to delivering the right message to the right person at the right time.

USIA also plans and executes, in the field, the cultural and educational programs administered in Washington by the State Department. Such activities are an integral part of USIS programming in support of U.S. foreign policy objectives.

USIA has responsibility for the overall coordination of U.S. PSYOP in stability operations where the military has not yet been assigned command responsibility.²⁰ For example, according to a Joint U.S. Public Affairs Office (JUSPAO) memorandum, the responsibility for development of PSYOP policy and for substantive supervision and coordination of all psychological operations in Vietnam [was] delegated to the director, JUSPAO,"²¹ who was the USIS chief there.

THE UNITED STATES ADVISORY COMMISSION ON INFORMATION

The United States-Advisory Commission on Information, established under the Information and Educational Exchange Act of 1948 (P.L.402), recommends to the USIA director the policies and programs for carrying out the act. In a semiannual report submitted directly to Congress, the commission gives its evaluation of USIA and recommends improvements in the information, education, and cultural programs.²² The agency maintains a secretariat for the commission with a fulltime staff director.

AGENCY FOR INTERNATIONAL DEVELOPMENT

The Agency for International Development (AID) was established in 1961 within the State Department when the former International Cooperation Administration (ICA), the Development Loan Fund, and other foreign assistance activities were merged.²³ AID's mission is to carry out U.S. overseas programs of economic and technical assistance to less developed countries, programs designed to bring the countries to a level of self-sufficiency.

For political, economic, and humanitarian reasons the United States has for over two decades been committed to helping the poorer nations of the world achieve their aspirations for social and economic growth. In this connection, the present administration has undertaken the following shifts of emphasis in the assistance effort.²⁴

- increased emphasis has been placed on multilateral aid programs with the administration moving toward greater coordination of U.S. aid with that of other donors;
- more emphasis is being given to applying U.S. knowledge to the problems of development through technical assistance, research, and social innovations;
- the highest priority is being placed on agricultural production and family planning;
- foreign procurement policies are being relaxed to assist the export potential of developing nations, and,

- opportunities are being increased for private enterprise to engage more directly in the development process.

In April 1971, the president sent proposals to Congress for the reorganization of U.S. foreign assistance programs. The changes proposed are not only in philosophy but also in the organizational framework and operating style.²⁵

The Washington Level of AID

The AID administrator reports directly to the secretary of state. From 1961 to 1968 the secretary's authority had been delegated to the administrator of AID. In January 1968, in an effort to strengthen the State Department's supervision and control of these programs, this authority returned to the secretary who redelegated part of it to the under secretary of state and part to the then deputy under secretary for political affairs. The former was given general authority to supervise the effective integration of both the economic assistance and military assistance and sales programs within the context of U.S. foreign policy interests, while to the latter was delegated (later redelegated to the director of politico-military affairs) the day-to-day responsibility for the continuous supervision and general direction of the military assistance and sales programs.

In fact, the State Department does not and could not operate and manage the military assistance programs directly. The principal mechanisms for the formulation and application of policy on the presidential level are the annual budget preparation and the presidential decisions taken in the NSC system. At the departmental level there is a continuous dialogue between the State Department and DOD.²⁶

The administrator of AID is supported currently by a headquarters staff, five regional bureaus (Africa, Latin America, Near East and South Asia, East Asia, and Vietnam), and the overseas missions. Among other things, the headquarters staff assists in the development of policy and procedure, while the regional bureaus, also located in Washington, are the principal line offices of the AID and are responsible, within overall agency policy, for planning and supervision of U.S. economic development assistance efforts in individual countries overseas.

Although AID operates mainly on the basis of bilateral programs, the agency encourages, supports, and participates in international organizations, consortia, and other coordinating groups designed to provide economic and technical assistance. Of these institutions, the Development Assistance Committee (DAC) is the major international body for general coordination of free world economic assistance policy, and the International Bank for Reconstruction and Development (World Bank) is the largest of the multilateral lending institutions.

AID Operations Overseas

Approved programs are executed by overseas U.S. AID missions (USAIDs) in cooperation with the officials of the countries being assisted. Several approaches to development assistance are employed:

- *Technical Assistance* is provided to developing nations through the assignment of technical experts as advisors to the public and private sectors of less developed countries and through participant training provided mainly in the United States for cooperating country nations.
- *Capital Assistance*. Capital loans, repayable in U.S. dollars on more favorable terms than private banks would offer, are conditioned on matching measures of self-help by the recipient country to further its own development.
- *Commodity Assistance*. U.S.-produced food and fiber needed for development (either general or in specified economic sectors) is made available through loans, and to a small extent grants, under the Food for Peace Program.
- *Private Investment Surveys*. Through a program of cost-shared investment feasibility surveys, private U.S. firms are encouraged to investigate specific investment opportunities that would contribute to the achievement of objectives in less developed countries.
- *Civil Security Assistance*. AID Public Safety assistance is produced to Free World countries to help them develop civil police institutions capable of maintaining the internal stability essential for economic, social, and political progress. The Public Safety Program serves to train civil police and paramilitary police forces to prevent the development of threats to internal order and to deal with them humanely in their earliest phases so that costly military solutions to civil problems will not have to be chosen later.²⁷

AID's most important contribution to U.S. PSYOP is a result of its development activities. As an example, the provision of radios to villages remote from central government administration fulfills several objectives in the nation-building effort and supports PSYOP and public security objectives as well.²⁸

THE DEPARTMENT OF DEFENSE

The Department of Defense (DOD) was created as a part of a comprehensive program designed to provide for the future security of the United States through the establishment of integrated policies and procedures for the departments, agencies, and functions of the U.S. Government relating to national security.²⁹ Two of its functions prescribed by higher authority are directly relevant to PSYOP:

- to insure by timely and effective military action, the security of the United States, its possessions, and areas vital to its interests; and
- to uphold and advance the national policies and interest of the United States.

Since the early 1960s, DOD has been adjusting to new forces, circumstances, and aspirations in the national and international environments. As diplomatic, economic, and military resources have been integrated more closely than ever before into national security plans and programs, DOD has steadily established intricate relationships with

many of the other departments and agencies. Military-political contacts—both with the Department of State and with various foreign governments—have become routine, and defense strategy shares a principal objective with foreign policy: the preservation of U.S. national security.

Office of the Secretary of Defense

Secretary of Defense

The secretary of defense is the principal assistant to the president in all matters relating to DOD and exercises direction, authority, and control over the department. He serves as a member of the NSC. Among the several principal military and civilian advisors and staff assistants to the secretary, his assistant secretary for international security affairs (ASD/ISA), in particular, has major PSYOP-related responsibilities.

Office of the OSD/ISA

ASD/ISA is the principal staff assistant to the secretary in the functional field of international security and acts as a DOD liaison in the foreign policy field. He develops, coordinates, and recommends to the secretary of defense DOD positions on NSC affairs and foreign economic and politico-military matters (including disarmament) of DOD interest. Responsible for the planning, direction, and management of the Military Assistance Program (MAP) and the activities of the Military Assistance Advisory Groups (MAAGs) and military advisory and training missions to foreign nations, the assistant secretary also provides guidance to DOD representatives on U.S. missions and international organizations and conferences.

Within OASD/ISA, the specific responsibility for action on PSYOP is currently in the Long Range Planning Section of the Office of the Deputy Assistant Secretary for Policy and Plans, and NSC Affairs. Another deputy assistant secretary handles the military assistance and sales plans and programs.

The Joint Chiefs of Staff

As the principal military advisors to the president, the NSC, and the secretary of defense, the JCS are directly concerned with PSYOP. They serve as the immediate military staff of the secretary of defense. They are in the chain of command that runs from the president to the secretary of defense, through the JCS, to the commanders of unified and specified commands. The chain of command to the Defense Intelligence Agency (DIA) also runs from the secretary of defense through the JCS. The JCS are assisted in the performance of their duties and responsibilities by the joint staff and other agencies of the organization of the JCS.

The Joint Staff is organized into directorates concerned with:

- Personnel (J-1)
- Operations (J-3)
- Logistics (J-4)
- Plans and Policy (J-5)
- Communications-Electronics (J-6)

The intelligence function for the JCS is undertaken by the DIA. All of

these directorates have varying degrees of interest in PSYOP. In addition to the directorates, the activities of the various special assistants occasionally involve PSYOP. It is the director, J-3 (Operations), however, who has the responsibility in all matters pertaining to the psychological aspects of military operations. His principal staff assistant for PSYOP is the deputy director for operations (counterinsurgency and special activities) or DOCSA. DOCSA is supported by the PSYOP Division of J-3.

Military Assistance Advisory Groups

The Chief of a Military Assistance Advisory Group (MAAG) is the personal representative of the Secretary of Defense in the country to which he is accredited. The ASD (ISA) is responsible for planning, organizing, and monitoring activities of the MAAGs, which receive their military guidance from the JCS through the appropriate unified command.³⁰ If a MAAG is located in the host country, it will often have access to information that may be important to the success of a PSYOP program. Representatives of the MAAG chief are therefore often included in the country team PSYOP agency, if one is formed.³¹

Other DOD Groups with PSYOP Responsibilities

Within DOD, the work of the ASD (Public Affairs) often has potential PSYOP aspects. These include monitoring the release of all official DOD information for publication through any information media as well as responsibility for military participation in public exhibitions, demonstrations, and ceremonies of international significance.

The director of defense research and engineering (DDRE) directs and supervises the activities of the Advanced Research Projects Agency (ARPA). ARPA is a separately organized (DOD) research and development agency that is responsible for selected basic and applied research. It has supported PSYOP-related tasks as directed by higher authority. ARPA utilizes the services of the military departments, other governmental agencies, private and industrial entities, individuals, and educational or research institutions to perform its projects.

Ongoing Operations

Responsibility for the training of personnel in PSYOP continues to be located in each of the separate military services. Each of the services continues on an individual basis, and with varying degrees of effort, to refine its own doctrine for PSYOP.

OTHER AGENCIES

Since effective PSYOP requires a wide array of resources, the PSYOP community involves the support of several other agencies and departments on either a full-time or intermittent basis. Many government and private agencies contribute intelligence, logistical cooperation, or other assistance: for example, the Central Intelligence Agency, the Department of Agriculture, the Department of Commerce, the Department of Justice, the Department of Labor, the Department of the Treasury, and

organizations involved in education, health, disaster relief, arts and sciences, and missionary work.³²

CONCLUSION

This is the structure of the national security system as it relates to PSYOP. Other writers have pointed to the need for closer cooperation, better coordination, less duplication of activities, more systematic planning and analysis among the various agencies, and the like. The current structure in which the centralizing role of the National Security Council has been re-emphasized represents an important attempt to address these problems—problems which plague many functions besides PSYOP—without reducing the responsiveness of the system to the president's needs in other areas.

In retrospect, there has been an overall trend since the early 1960s toward a greater understanding and appreciation within the executive branch of the U.S. Government of the use of psychological operations. However, the test of the current framework of U.S. PSYOP is in the answers to the questions: How well have the realities of present-day PSYOP been perceived? How well have the capabilities and potentialities of the various departments, agencies, and military services been recognized and employed?

USIA's MISSION AND RESPONSIBILITIES*

BY IRVING R. WECHSLER

Policies and missions for both strategic and tactical operations must be clearly defined, current, and capable of attainment.

During the administration of President Lyndon B. Johnson, the foreign information resources of the Government continued the development that began in 1945, when the United States for the first time established an official peacetime organization to inform foreign people about the United States and its policies. The United States Informtion Agency, the direct descendant of that organization, expanded in some directions, consolidated in others, shaping and defining its mission and role essentially as a response to the changing longterm nature of international relationships, and to the shifting urgencies and more immediate stresses of the time.

*Excerpts from "USIA's Mission and Responsibilities," in Murray G. Lawson, et al. "The United States Information Agency During the Administration of Lyndon B. Johnson November 1963-January 1969. Volume I: Administration History," Washington, D.C., 1968. Reprinted with the permission of the author.

THE TRUMAN CONCEPT

The basic character and rationale of United States information activities abroad were in certain important aspects, implicit in the August 1945 announcement of President Truman's decision to maintain, as a peacetime service in the Department of State, some of the foreign information functions of the Office of War Information and the Office of Inter-American Affairs.

"The nature of present-day foreign relations makes it essential for the United States to maintain informational activities abroad as an integral part of the conduct of our foreign affairs," President Truman stated in ordering the creation of the Interim International Information Service, a transitional organization, pending study of foreign informational needs by the Secretary of State, and the formulation of a program to be conducted on a continuing basis.

This first statement of mission and responsibilities, brief and general though it was, suggested certain principles that continue to influence the conduct and the concept of United States foreign information programs. The most important, of course, was the idea that foreign information activities are an integral part of the conduct of foreign affairs, arising out of the contemporary nature of foreign affairs; a recognition that diplomacy was to have henceforth a new dimension, stemming from the increasing importance of world public opinion and attitudes, and the burgeoning new technologies that were shaping and expressing them.

This "Government," the statement also announced, "will not attempt to outstrip the extensive and growing information programs of other nations. Rather, it will endeavor to see to it that other people receive a full and fair picture of American life and of the aims and policies of the United States Government." The primary means of informing other nations about the United States would continue, "as in the past" to be American private organizations and individuals; the Government's role would be to assist and supplement them.

Thus, certain limits and emphases were indicated: The United States Government would avoid competition with private American enterprises and activities in overseas information, and would not take its measure from other Governments' propaganda programs. At the same time, its programs would go beyond official Government action and policy, to present "American life," and to "endeavor to see to it that other people receive a full and fair picture."

Although what is full and fair has at various times been variously interpreted, there has been continued general acceptance of the view that the official American interpretation of America and its policies must rest its case on presenting actualities without deliberate distortion. And finally, the 1945 statement embodied a principle that has been rigorously maintained—both by Congressional insistence and Executive direction—the principle that the overseas information programs would have no responsibilities for explaining Government programs domestically.¹

THE SMITH-MUNDT REVISION

Early in 1948, the United States Information and Educational Exchange Act (PL 80-402, the Smith-Mundt Act) was passed, reflecting a Congressional realization that the postwar world demanded that the United States have a capacity in the field of foreign information considerably greater than the rudimentary organization that had uneasily and barely survived in the Department of State since 1945. Spurred by the descent of the Iron Curtain, the aggressive posture and programs of the Soviet Union and world Communism, and the clear need for the American story and American policies to penetrate through the perils and complexities that were besetting peoples overseas, the Act stated that its objectives were "to enable the Government of the United States to promote a better understanding of the United States in other countries, and to increase mutual understanding between the people of the United States and the people of other countries." Among the means to be used in achieving these objectives were "an information service to disseminate abroad information about the United States, its people and policies" and "an educational exchange service."

The passage of the Smith-Mundt Act gave to the information mission both a firm legislative base and a new scale, scope, and prominence. Less from the language of the Act than from the debate and discussion that accompanied it, an awareness of its role and more explicit development of ideas about it emerged—both within the Government and among the public. Two specifics were visible in the Act. One was the emphasis on mutual understanding—the idea that a two-way process was somehow involved, that more than simple declaration and amplification were to be part of the creation of "mutual understanding." Secondly, the Act made explicit the separation of "information" and "educational exchange" as two distinct and different means of creating understanding—one allegedly "propagandistic" and the other "educational" or "cultural."²

THE EISENHOWER RESTATEMENT

On August 1, 1953, the United States Information Agency (USIA) was established by President Eisenhower's Reorganization Plan No. 8, combining the separate overseas information functions of the Department of State's International Information Administration, the Mutual Security Administration, and the Technical Cooperation Administration. The exchange of persons program, however, was left in State.³ The USIA was instructed to take its foreign policy guidance from the Department, while being responsible to the President through the National Security Council.

The new Information Agency was given a formal "Statement of Mission," on October 22, 1953. This was the first effort to promulgate, in more than the most general terms, the task and methods of United States foreign information efforts. "In carrying out its responsibilities" the Eisenhower statement said, the Agency shall be guided by the following:

1. The purpose of the United States Information Agency shall be to submit evidence to people of other nations by means of communica-

tion techniques that the objectives and policies of the United States are in harmony with and will advance their legitimate aspirations for freedom, progress and peace.

2. The purpose in paragraph 1 above is to be carried out primarily:
 - a. By explaining and interpreting to foreign peoples the objectives and policies of the United States Government.
 - b. By depicting imaginatively the correlation between U.S. policies and the legitimate aspirations of other peoples of the world.
 - c. By unmasking and countering hostile attempts to distort or to frustrate the objectives and policies of the United States.
 - d. By delineating those important aspects of the life and culture of the people of the United States which facilitate understanding of the policies and objectives of the Government of the United States.

Two additional paragraphs, not made public at the time, regulated the Agency's use of "unattributed" materials.

Some significant emphases in the statement included the stress on "submitting evidence," by some considered to avoid the propaganda stigma of special pleading by "allowing the material facts to speak for themselves;" the stress on demonstrating a harmony of interests, rather than an effort to convert, polemicize, or advocate; the stress on aspects of the United States "which facilitate understanding"—a sharper focus on the purposive and relevant "projection of America" than had sometimes obtained; and the clear and unmistakable mandate for counterpropaganda—to some minds, the primary (if not sole) justification for an information program.⁴

This first formal statement of the Agency's information mission was a significant advance in sophistication and complexity. It served to supply clearer guidelines for action, and to crystallize out new and old doctrine and emerging ideas. As the first Director, Theodore C. Steibert, stated in a letter to the President:

Under this new mission, avoiding a propagandistic tone, the Agency will emphasize the community of interest that exists among freedom-loving peoples and show how American objectives and policies advance the legitimate interests of such peoples.

We shall, therefore, concentrate on objective, factual news reporting and appropriate commentaries, designed to present a full exposition of important United States actions and policies, especially as they affect individual countries and areas. In presenting facts we shall see to it that they are not distorted. . . we shall avoid a strident or antagonistic note. This does not, of course, preclude us from making forceful, factual refutations of false accusations such as those that come from the Soviet communist portion of the world.⁵

THE KENNEDY DEFINITION

During the Administration of President John F. Kennedy, a redefinition of the Agency's mission was formulated. Embodying concepts that had been "put into practice in early 1961" by USIA Director Edward R. Murrow, the new statement was drafted within the Agency, and formally issued in January 1963 as a Presidential directive.

The Kennedy redefinition accepted and continued certain important elements in the Eisenhower statement—a counterpropaganda role, a

stress on those aspects of American life and culture which facilitate understanding of United States policies, and a focus on demonstrating harmony between U.S. policies and the interests of other peoples. It introduced, however, some significant new emphases.

"The mission of the United States Information Agency is to help achieve United States foreign policy objectives," the statement began, giving prominence and explicitness to a role and function that had sometimes been taken for granted, sometimes asserted, sometimes denied or qualified—both within the Government and in public discussion. This support of U.S. foreign policy was to be accomplished in two ways. One was by "influencing public attitudes in other nations," the other by "advising the President, his representatives abroad, and the various departments and agencies on the implications of foreign opinion for present and contemplated United States policies, programs, and official statements." ⁶

The explicit public assertion that the Agency sought to influence public attitudes abroad was to some a note of welcome candor, while to others it seemed to make USIA too nakedly manipulative or self-serving. In a statement made before a House Subcommittee on March 28, 1963, Director Murrow indicated the limits and interpretation that the Agency sought to give the concept of influence: "Our Government tries to present its policies and programs in as understandable and palatable form as possible—understandable and palatable to those millions abroad, friend, foe, and neutral, whose lives and fortunes are affected by what we do." What was sought as effective communication, he emphasized, was "believability and persuasiveness." "To be persuasive we must be believable; to be believable we must be credible; to be credible we must be truthful. It is as simple as that.... Obviously... we emphasize those aspects of American life and policy which are of greatest significance in furthering our foreign policy objectives. We report events in context; we explain why things happen. But we do not lie, we do not cheat, we do not suppress."

An explicit acknowledgment that the Agency's mission was to be persuasive in support of U.S. policies appears less revolutionary in practice than the explicit injunction of the Kennedy statement providing that the Agency was to serve as an adviser to the Government on the foreign opinion implications of all its activities—and hence have an important advisory role in the formulation of the very policies that it would seek to publicize abroad. This new responsibility was doubly significant. For it is axiomatic that in a democracy the foreign information activities must take their policy direction from those charged with responsibility for the conduct of foreign affairs. As Murrow put it succinctly, "We are, then, and properly so, prisoners of [U.S. foreign] policy." In the second instance, this explicit advisory role took on particular importance at this juncture because President Kennedy had just abolished the Operations Coordinating Board, established by Eisenhower in 1953 as a mechanism for concerting the Government's psychological activities—a device, cum-

bersome though it was, that had permitted USIA some voice in inter-agency consideration and planning. In essence, therefore, the new directive reflected both increased and more sophisticated awareness of the role of public opinion and attitudes in foreign affairs, and the view of Murrow (as one observer has put it) that USIA "should persuade, not just inform, and that it should aggressively and expertly advise the Executive Branch on the foreign opinion implications of policies and programs."⁷

THE JOHNSON ADMINISTRATION'S NEW EMPHASES

During the earlier days of the administration of President Lyndon B. Johnson, USIA's role reflected the primary needs of a time of tragedy, transition, and the emergence of new directions and new emphases. The need to assure foreign publics that U.S. political processes, policies, and institutions would show steadiness, stability, and continuity appeared paramount. USIA's mission, however, remained essentially as it had been defined and redefined by earlier statements and existing doctrine. Nevertheless, the complex process of adapting the Agency's information resources to new times and new needs proceeded, but gradually and without high visibility—first under Carl T. Rowan (1964–65) and then under Leonard B. Marks (1965–69).

Although Rowan accepted the general statement of mission given the Agency by President Kennedy, and offered no formal redefinition or elaboration of its interpretation, the emergence of new national preoccupations brought new emphases. President Johnson's programs and the problems he faced gave an increased prominence to the U.S. domestic scene. The accelerated pace of efforts to end discrimination, to expand opportunity, and to make war on poverty, along with the resistance encountered and the violence generated, brought to the foreign audience an increased awareness of the U.S. internal situation with dramatic impact and sharpened detail. The prominence of domestic issues and events made for some change in the role of USIA. The persuasive emphasis diminished. Engaged in explicating and reporting developments of increasing complexity—and often of a kind that invited sharply critical condemnation—the Agency had a growing need to rest its case more on providing the background and perspective necessary to an objective understanding of the developments of the day.

Other forces, less dramatic, were also at work to give USIA's concept of its mission new nuances. One was a growing awareness of the limitations of official propaganda as an instrument for securing vital and durable changes in foreign attitudes. The accumulating evidence of academic research had begun to make clearer that the psychological processes of international communication were both more complicated and more difficult than had been assumed by many proponents and practitioners of the art. A more realistic judgment of the capabilities of persuasion and information as instruments of national purpose appeared in the making.

Another force was the burgeoning apparatus of international communication. The "communication revolution" immensely multiplied the reach and range of a nation's ability to transmit its messages, and this revolu-

tion in communication technology was augmented by the developments in transport technology. On the one hand new electronic mechanisms vastly expanded the speed and the amount of communication that was possible between nations and among people; on the other, new mobility brought multiplied and closer contacts. But there was no corresponding assurance of reception and attention—and, hence, of understanding.

Finally, in his remarks at the White House swearing-in of Director Marks, in September 1965, President Johnson stressed the central role of truth in USIA's mission, and disavowed a propaganda aspect. The United States, he said, "has no propaganda to peddle" since "we are neither advocates nor defenders of any dogma so fragile or doctrine so frightened as to require it."

THE MARKS STATEMENT OF MISSION

No doubt influenced by these various developments, Director Marks issued a restatement of the Agency's mission on March 6, 1967. It reflected and elaborated upon many of the forces and preoccupations that were actively shaping the Agency's task "in an increasingly complex world society." He began by restating the basic assumption that President Truman had voiced more than two decades before, namely, "that our responsibility for direct communication with foreign audiences is essential to the conduct of foreign relations," and stressing that this "reflects awareness that public opinion exerts increased influence on governments throughout the world and reaches beyond national barriers." He reaffirmed the persuasive aspect of the Agency's mission and its necessity to create understanding within the context of U.S. foreign policy objectives: "To achieve its foreign policy goals, the United States must break down barriers of misunderstanding; it must communicate effectively and persuasively on the many issues on which our security and welfare depend."

Discussing "The Task of USIA," Director Marks noted that "in carrying out the mission assigned us by law and Presidential directive, USIA:

Supports the foreign policy of the United States by direct communication with people of other nations.

Builds understanding of the United States, its institutions, culture and policies among other people; and shares with them information, thought and experience that can contribute toward achieving mutual goals.

Advises the U.S. government on public opinion abroad and its implications for the United States."

Given new prominence was the concept that USIA "shares . . . information, thought and experience that can contribute toward achieving mutual goals." The idea of harmonizing policies and interests and of demonstrating a consonance of goals was not new; neither was the idea of a sharing of experience and information. But they took on a new emphasis, significance, and explicitness in Marks' discussion of how he viewed the Agency's goals. "I find it helpful," he declared, "to view USIA objectives in the following three broad categories: The United States as a Nation . . . International Issues and U.S. Policies . . . National Development." It is in this last category that there is apparent a major new dimension of information tasks.

Since before World War II, the United States has had programs of

economic aid, rehabilitation, and technical assistance. But the emergence of new nations—many with only the beginnings of the political, economic, and social institutions, traditions, and skills that viability as a modern nation demanded—gave a new aspect and a new content to international relationships, particularly in the postwar context of U.S.-U.S.S.R. rivalry. The developing nations were both an audience and an arena of competition with new and special characteristics. To approach them exclusively within the framework of previous concepts and objectives would not do: the Agency could not, in the words of the Eisenhower statement of mission, simply “submit evidence . . . by means of communication techniques that the objectives and policies of the United States are in harmony with and will advance their legitimate aspirations for freedom, progress, and peace.” Nor could “influencing public attitudes in other nations” in support of U.S. foreign policies, as the Kennedy directive enjoined, be accomplished so directly as had sometimes been assumed. The new audiences had limited concerns and awareness outside the pressing urgencies of building their own nations and creating viable economies, workable political institutions, and the social structure and educational levels that would allow them to survive and participate fully in the modern world. Moreover, the techniques and apparatus of communication and public opinion formation that worked with the more established and the more industrialized nations—the chief audiences of earlier information programs—were less applicable to more rudimentary societies of the developing countries.

Expanding on the “National Development” objective, Director Marks stipulated tasks that were a considerable remove from the traditional concepts of changing attitudes about U.S. foreign policy.

The United States is today helping many developing countries to build the foundations of independent, modern states, responsive to the needs of their people. USIA has a role in this total US effort. It may include: Explaining AID assistance and showing how cooperative programs can spur the nation's growth; Helping build understanding of responsible citizenship and the democratic process; Focusing attention on critical issues such as the relation of population to agricultural production; Sharing relevant thought and experience that the developing countries can apply to their own problems; Acting as a catalyst in the circulation of ideas and helping build new attitudes that must underlie modernization.

These tasks reflect an increasingly sophisticated and flexible view of the kind of information and the kind of persuasion that would best serve the national interest and U.S. foreign relations—both viewed somewhat more broadly than has been traditional.

In “The United States as Nation” objective, Marks likewise stressed the criterion of relevance to other peoples’ interests and preoccupations, and the need to understand and acknowledge these concerns. The “USIA’s fundamental responsibility to build understanding of the United States, its institutions, culture, and ideals,” he declared “is a necessary basis for the respect, confidence, and support that the U.S. world role today requires.” However, he continued, “because the panorama of America is so broad, we must concentrate on *significant* aspects most

relevant for our audiences in their total judgment of the United States. . . . The values that our audiences themselves prize, as well as the misconceptions they hold about the U.S. should determine the points of emphasis in each country program.”⁸

* * * * *

OTHER RESPONSIBILITIES: NEW AND OLD

Under the Fulbright-Hayes Mutual Education and Cultural Exchange Act of 1961 (PL 87-256) the President was given authority to provide for “United States participation in international fairs and expositions abroad. . . .” Although the President delegated this function to the Director of USIA, who in turn for several years redelegated this responsibility to the Secretary of Commerce, . . . USIA resumed [this] responsibility [on July 1, 1966]. . . . At the same time, the Agency transferred to the Department of Commerce responsibility for budgetary support of Commerce’s trade mission programs. . . .⁹

[USIA,] which had been responsible for U.S. international art exhibits,¹⁰ transferred responsibility for such programs (except in Eastern Europe and the U.S.S.R.) to the Smithsonian Institution in 1965.¹¹

* * * * *

[However,] policy guidance on international relations and psychological factors was to be provided by the Department of State and USIA, respectively.¹²

If the persuasive function of USIA lost emphasis, the informative function generally gained, and the function of advising the rest of the Government on psychological implications received only minor attention during the Johnson Administration, one massive exception stands out. In Vietnam, and about Vietnam, the older concepts of official information programs were re-established and extended: this active war meant that USIA assumed tasks that had originally been performed by one of its progenitors, the Office of War Information, namely, psychological tactical and strategic and political warfare. But more than a deflection into a former role for information was involved. A new and striking feature was the degree of integration of USIA with other elements of the Government, both abroad and in Washington, and the leading responsibility that USIA assumed in Saigon.

On the basis of earlier experience, it was decided in 1965 that U.S. psychological action in Vietnam required unified direction, encompassing both military and civilian. In April, the National Security Council delegated responsibility for policy direction and coordination of all U.S. psychological action programs in Vietnam to the Director of USIA. A new U.S. Mission organization, the Joint U.S. Public Affairs Office (JUSPAO) was set up to carry out this responsibility within Vietnam.¹³

But for a peacetime organization, with a wide range of continuing responsibilities in all quarters of the globe, so clearly a military-psychological operation as JUSPAO created some problems, anomalies, and disproportions.

In 1966, JUSPAO's field organization was merged, along with the field elements of other civilian agencies, into an Office of Civil Operations, and later, this organization was combined with noncombat military field activities into a Civil Operations and Revolutionary Support Office—steps that diluted JUSPAO's operational control and influence.

THE FUTURE

The successive definitions and redefinitions of USIA's mission and functions bid fair to continue. The changing emphases and directions, the experiments and extensions and retreats, appear an inevitable reflection of the fact that political communication—information activities, propaganda, public diplomacy, however, it is labeled—is a part of the international political process, and that is never static.

SELLING UNCLE SAM IN THE SEVENTIES*

BY KENNETH R. SPARKS

Communication reflects society as well as influencing it. All communications channels are important in overseas communications efforts.

It is seven p.m. in Moscow and before a distinguished audience of Soviet dignitaries, dance enthusiasts, and bureaucrats in Estradniy Teatr, the curtain rises on a performance by America's Alvin Ailey Dance Company.

At that very moment in Munich, the Amerika Haus plays host to sixteen German college students discussing the future of the North At-

* Excerpts from "Selling Uncle Sam in the Seventies" in "Propaganda in International Affairs," *The Annals of the American Academy of Political and Social Science* (November 1971), pp. 113–123. Reprinted with the permission of the American Academy of Political and Social Science and the courtesy of the author.

lantic Treaty Organization. Tom Anders, a Fulbright Scholar and graduate student in political science at the Massachusetts Institute of Technology, leads the discussion.

In New Delhi, the American Ambassador is calling on Mrs. Gandhi to present a copy of a recent book about her father, former Prime Minister Nehru, by a University of Michigan professor.

Meanwhile, classes are changing at the binational center in Cali, Colombia. Seventeen-year-old Maria Angela Lopez wanders through the halls, gazing at an exhibit which features the Apollo XI moon mission and waiting for her third-year class in English to begin.

In a Bulgarian village just outside of Plovdiv, a retired army officer closes the door to his bedroom and turns on the radio to catch a news broadcast from Radio Free Europe.

In Bangkok, theater lights dim on a full house of Thais who have come to watch John Wayne sock it to the bad guys once again. Following the feature, they will see an unattributed thirty-minute documentary depicting the Soviet Union's ruthless crushing of Czechoslovakia's moment of liberalization in 1968.

All of this represents America's propaganda machinery in action. Around the clock, around the globe, thousands of Americans and non-Americans alike are hard at work seeking to create or enhance public support overseas for United States foreign policy. All but a few of the many government agencies and departments play some part in this operation.

Ostensibly, our primary propaganda vehicle is the U.S. Information Agency (USIA). It is charged with "influencing public attitudes of other nations . . . by overt use of various techniques of communication . . ."¹ To carry out this mission, USIA uses radio, television, motion pictures, magazines, newspapers, pamphlets, libraries, exhibits, concerts, English-teaching, and as much personal contact as possible. With a staff of just over ten thousand employees, about half of whom are "locals"—non-Americans who do most of the non-policy work—the agency operates programs in over one hundred countries. In those countries where USIA activity is prohibited, the agency used its international radio arm, the Voice of America, in an attempt to reach the population with the American message.

But, though USIA was created in 1953 to serve as our chief propagandist, its role has always been limited.² Other agencies within the governmental hierarchy share its responsibilities.

Any inventory of the American propaganda arsenal must begin with the White House press conference and the daily State Department press briefings. Covered by a host of foreign reporters and by the many news services circulated abroad, these two channels may well be the most important propaganda tools we have. But since these press conferences and briefings are also covered by domestic media, USIA does not partici-

pate. Congress, on numerous occasions, has indicated its intent that the American government not engage in domestic propaganda.

The State Department also has responsibility for cultural exchange. When USIA was organized, many felt that the exchange programs should be moved to the new agency together with the information or propaganda activities An Assistant Secretary of State makes the policy decisions which direct the annual exchange of 6,000 students, teachers, research scholars, professionals, and government and business leaders. He also manages a limited program of cultural presentations ranging from the Philadelphia Orchestra to the late Louis Armstrong. USIA administers these programs overseas, an anomaly explained only by convenience.

Primarily known for its information-gathering or spying, the Central Intelligence Agency directs a number of sensitive operations that include propaganda. As with all CIA operations, only a select few government officials know the exact nature and dimensions of the propaganda effort. But it has become common knowledge that Radio Free Europe and Radio Liberty, which broadcast to Eastern Europe and the Soviet Union, respectively, are creatures of the Intelligence Agency. Other transmitters in the Caribbean and Southeast Asia have also been traced to the CIA. In addition, the CIA supports local writers in many countries who produce favorable editorials or commentaries when the occasion demands.

The roster of cooks in the U.S. government's propaganda kitchen doesn't stop with the White House, the State Department, and the CIA. Virtually every major department conducts some international activity designed to win friends and influence people abroad. Defense, Commerce, Health, Education, and Welfare, Peace Corps, Nasa—even the Smithsonian—all have their propaganda role. The cost of these operations is close to \$300 million annually. USIA's budget is roughly \$185 million. The State Department's cultural exchange unit spends approximately \$40 million annually.

* * * * *

LACK OF MISSION

Permeating USIA and the State Department is the conviction that American propaganda lacks direction and purpose, that our information and cultural efforts, and even our foreign policy, are lagging behind the changing world we are trying to influence. As relations thaw with the Soviet Union and Communist China, hard-hitting anti-Communist themes, long a staple of USIA's menu of activities, seem anachronistic.

. . . . Not only does policy appear to be out of date to many observers; it is sometimes non-existent. An example was given me by former Ambassador to France, Sargent Shriver. After his appointment by President Johnson, he searched in vain for an indication of what the State Department expected him to achieve. Preoccupation with Vietnam and a departmental belief that nothing of substance could be achieved while DeGaulle was in power had left a void in U.S. policy. When he turned to the long-range policy staff at the State Department and asked for guid-

ance, one official confessed that none existed, then asked, "Have you tried George Ball's latest book?"

"How can U.S. propaganda be effective until we have a clearly enunciated foreign policy?" mused Shriver. "It's like asking J. Walter Thompson to prepare a campaign for Procter and Gamble and finding out that P & G has no idea what it is trying to sell."

. . . . A second reason for the sense of uneasiness with U.S. propaganda within and without the government stems from frustration over Vietnam. Attempts over the past seven years to explain U.S. involvement in Southeast Asia as (1) fulfilling our commitment to defend a free people, or (2) meeting a Communist threat to the free world's security, have met with skepticism. Whether Vietnam proves the have been right or wrong in the long run, the short-term consequence has been a major psychological defeat for the United States. And a flop on such a global scale is enough to shake the foundations of any public relations firm, even the world's largest.

[USIA FUNCTIONS]

. . . . But it is important to step down from such macrolevel analysis and look for a moment at the functions U.S. propaganda is expected to perform. From time to time, the Information Agency has attempted to serve in at least five capacities: (1) information disseminator, (2) cultural programmer, (3) psychological warrior, (4) nation builder, and (5) public relations adviser. How well does it do each of these?

As a disseminator of information, USIA does about as well as can be expected. The agency has a competent staff of professional media personnel who, by and large, do a pretty good job of getting the message out through available channels. As mentioned earlier, however, many of our most successful operations are in countries where we have only the most limited national interests. Except for routine press contact, occasional special programing such as satellite hook-ups, and a few highly specialized publications, the agency has had little success in reaching Europeans. People in Europe are inundated with information from domestic sources, much as we are in America, and it is difficult for USIA to have much impact.

Those who measure success by counting the communists who have been converted to American-style democracy are bound to be disappointed with the U.S. informational effort. In line with what one would expect from communication theory, USIA is most successful in reinforcing existing attitudes. Relatively less effective are efforts to reach people for whom foreign affairs are less salient. And least successful are attempts to convert opinions from negative to positive. Since congressional attitudes toward the agency have traditionally been related to our "success in winning the Cold War," top officials at USIA have had to provide Congress with a variety of specious proofs of effectiveness at conversion. It is a phony game of piling anecdote upon anecdote which successive agency directors have felt obliged to play.

In cultural matters, USIA shares responsibility with the Department of State's cultural unit. The agency maintains libraries, reading rooms, and information centers, through which most cultural programming is done. In Latin America, Africa, the Middle East, and sections of South Asia, programs of English instruction form part of the effort. The State Department expenditures in this area dropped from over \$55 million to less change of persons and cultural presentations.

Because these activities serve primarily long-range interests, effectiveness is hard to measure and pressures develop to divert resources elsewhere. For instance, during the period of 1965 to 1969, State Department expenditures in this area dropped from over \$55 million to less than \$36 million per year.³ As a result, there were fewer cultural exchanges and quality deteriorated. Recent increases in funding have barely matched inflation.

For the most part, the Information Agency has eschewed any responsibility for conducting psychological warfare after a brief flirtation with it in Vietnam. As one agency official put it, "Once the bullets start to fly, we have failed and it is time to hand over the situation to the military." The Vietnam episode taught USIA two valuable lessons. First, psychological warfare requires huge expenditures which rob other programs of funds and talent. And, second, many information and cultural personnel are not suited by training or temperament to "psy-war" activities.

NATIONAL DEVELOPMENT

.... For years, USIA staff and interested observers have sought a role for the agency in policy formulation. The case, in its simplest terms, was that USIA with its special expertise in communications could make a valuable contribution by advising the government on the psychological implications of various policy decisions. In his 1963 memorandum to Edward R. Murrow, President Kennedy accepted this argument and directed the agency to begin

advising the President, his representatives abroad, and the various departments and agencies on the implications of foreign opinion for present and contemplated United States policies, programs, and official statements ⁴

Murrow was made a member of the National Security Council, and other mechanisms were created for psychological contributions by USIA. These contributions have consisted mainly of (1) roundups of press opinion, (2) a few public opinion polls conducted by the agency's research division, and (3) largely intuitive judgments about the conduct of public relations.

Today this "psychological adviser" role appears to be minimal. Shakespeare does not sit on the National Security Council. His views are generally not sought out by the State Department. His direct contacts with White House staff are of doubtful importance. Other departmental channels exist for USIA to give its views on policy matters, but these seem to have limited impact.

.... Overseas, the role of psychological adviser is played by the top USIA officer. How seriously he is taken depends on the personal rela-

tionship he establishes with the ambassador. He has few tools, however, not available to other officers within the embassy.

In summary, U.S. propaganda suffers from a variety of ailments. It will require a major overhaul in Washington and in the field to get the propaganda machine back on track.

FUTURE EFFORTS

What, then, should be the basis of our propaganda in the 1970's? The answer depends on one's view of the world, one's conception of what American foreign policy should be, and the amount of confidence one has in the performance of private and public sectors.

Our relations with other countries will certainly become more, rather than less, difficult. Our audiences will be more sophisticated. No longer can we divide the world into two hostile camps—one free and the other Communist—and ask people to choose. Our broad commitments to peace, prosperity, and individual freedom must be manifested with deeds as well as words. Propaganda can often support and enhance good policy, but it can do little to promote what others conceive as bad policy.

Our audiences will also be larger, as greater numbers of people everywhere will almost certainly seek to share political power. The member of communication channels will be increasing, which, as we have learned in Europe, can be a barrier rather than a boon to international propaganda.

With these few generalizations as a preamble, I would suggest the following guidelines as a framework for United States propaganda in the 1970's:

1. Nongovernmental media will be America's primary vehicles for informing people in other lands about our policies and culture. Even if Congress were to increase funds dramatically for informational activities, a course which is neither likely nor wise, the official effort would be submerged by nongovernmental communications. Instead of lamenting this fact, the chief preoccupation of government propagandists ought to be to facilitate and promote the best of these unofficial media whenever possible. Ways should be found, for example, to reinstate and expand the old International Media Guarantee (IMG) program, a revolving fund through which private publications, television programs and motion pictures were distributed in certain Communist and other countries. Occasionally, an article or program may embarrass, but the harm created is minute compared with the image which emerges of a truly free and self-confident society that sanctions such distributions.

We must realize that propaganda in its broadest and most important sense is a reflection of our total society. It consists of much more than official government pronouncements, overseas libraries, radio programs, cultural exchange, and a few clandestine operations. Marshall McLuhan, writing in a domestic context, summarized this point well:

. . . propaganda does not consist in the conveying of messages by press or other media, but consists in the action of the total culture (language, food, ads, entertainment, etc.) upon its participants. The idea that propaganda consists of packaged concepts peddled to unsuspecting citizens is no longer tenable.⁵

We must place our confidence in the nongovernmental media to tell America's story. Aside from promoting these media, the role for U.S. official propaganda is to fill in the cracks, to round out the picture, to provide perspective.

2. Efforts should be based on what we know about the effects of communication, rather than on the naive political judgment that people's opinions can be radically changed if confronted with "the facts." Two decades of communications research have demonstrated that the primary effect of mass communication is to reinforce existing beliefs.⁶ This makes the job of the propagandist one of seeking out those attitudes compatible with U.S. objectives and reinforcing them. This task may not be so glamorous as converting enemies into friends, but it is much more likely to be accomplished.

3. As much as possible, our programs should provide a service from the audience's viewpoint as well as our own. Programs which are so limited in appeal as to attract only the favor-seekers and hangers-on ought to be eliminated. In many countries we don't need a full-blown propaganda program, because other media are performing the job for us, or our target audience is so small that it can be reached adequately by routine personal contact.

4. Cultural affairs programing in support of long-range objectives ought generally to be expanded. Increased support for exchange programs should receive top priority. To know others better may not be to love them more, but it does increase understanding. This is the one area that seems to warrant large increases in funds. Cultural presentations need to be improved. America can't afford to send any second-rate talent overseas; our primary emphasis should be on ways to encourage top artists and entertainers to perform abroad, commercially sponsored, if possible, in major population centers. The emphasis on physical facilities—libraries and information centers—ought to be reduced. The cost is too great for the amount of return.

5. Primary responsibility for propaganda decision-making ought to rest at the national level, with the ambassador and his public affairs adviser, based on foreign-policy objectives for that country.

The innovative resource allocation system of the current Administration is a step in the right direction. Under this system, the local staff decides how the money allocated to each country for public affairs programing is spent. This places the funds and the responsibility close to the action. Washington's role should be largely supportive, providing funds, policy guidance, and administrative and production services.

6. Organizationally, USIA should be returned to an expanded State Department, which would become a Department of Foreign Affairs headed by secretaries for political, economic, and information and cul-

tural affairs. A study conducted by the Brookings Institution for the Senate Foreign Affairs Committee in 1959 pointed the way.⁷

The arguments used in 1953 to separate information programs from the State Department have either been superseded or have proved less than persuasive. In sum, they were (1) that American propaganda was being outgunned by a monolithic Communist propaganda machine, and consolidation of efforts would produce better propaganda; (2) that old-line bureaucrats in the department did not understand or appreciate propaganda; and (3) that only by separation could field operations be consolidated and coordinated by Washington.⁸

We now know that, except where special circumstances have existed, the Soviets have had no more success than we, and in many cases they have been patently less successful. Furthermore, the new generation of diplomats now assuming control of our foreign affairs is made up of people who are conscious of the merits of "public diplomacy." Finally, field operations have been consolidated by giving ambassadors increased authority. Coordination of programs at home has not been measurably increased. In fact, USIA has become yet another policy-making center, together with the White House staff, the Department of State, and the Department of Defense.

A number of observers have called for cultural programs to be divorced from government control by establishing a quasi-public corporation such as the Communications Satellite Corporation (COMSAT) to take over their management.⁹

Considerable support for such a plan can be found and this general direction is one in which we should move. But the likelihood of adequate funding for the exportation of culture remains remote at this time in a country that failed to support the concept of government subsidies for the arts domestically until the late 1960's.

7. Personnel policies should encourage and reward special competence. Shifting staff members from one part of the world to another so that they may gain "fresh perspective" entails too great a loss in competence and personal happiness. Officers with special knowledge of underdeveloped countries and their problems should be shifted to the more developed countries only upon their request or for reasons of health.

Ways must be found to reward excellence in particular specialties. Today, the top pay goes only to the broadgauged generalist. A cultural affairs specialist finds himself bumping against the top pay bracket in a relatively few years. The Macomber Task Force has recommended such incentives, and the means should be found to implement them.¹⁰

8. Our propaganda should be seen and evaluated as a total system. Scientific evaluation will no doubt continue to be limited to the effects of specific programs. Social science tools are not yet capable of isolating effects on a larger scale, except at great expense. But there is a need for macro-evaluation, based on political judgments augmented by whatever data can be produced. To give a specific example, Uncle Sam now oper-

ates or funds a number of radio stations: the Voice of America, Radio Free Europe, Radio Liberty, Radio in the American Sector (Berlin), and American Forces Network (AFN). Each has a slightly different purpose, but each is part of our propaganda system.¹¹ Ought RFE and Radio Liberty to receive almost as much money as the Voice of America? This type of evaluation needs to take place across the entire propaganda activity spectrum.

To facilitate such analyses, the research and evaluation operation at USIA should be shifted to the National Security Council staff at the White House. This staff would then develop and conduct the necessary public opinion polling for policy formulation, measure the effectiveness of specific propaganda activities, and assemble data to aid political judgments required for resource allocation among propaganda agencies. Full consolidation of U.S. propaganda programs may not be feasible, but if the White House has the means to evaluate them as a system, duplication can be minimized and the over-all effort strengthened.

We move into the seventies with an increased understanding of the limitations of official propaganda. No longer does it conjure up images of Lenin and Goebbels with their seemingly invincible and mysterious techniques. A world increasingly saturated with communications media operating independently of government has become hard to reach with artificial and polemic messages conceived by government bureaucrats. But governments still have a need to explain their policies and their actions, to participate in the international dialogue on goals for mankind and the means to achieve them. Various information and cultural programs can promote and supplement private media in this task, given redirection and proper leadership.

DISCLAIMER

This report, "The Art and Science of Psychological Operations: Case Studies of Military Application," was prepared by the American Institutes for Research (AIR) under Department of the Army contracts in response to a request from the Office of the Deputy Chief of Staff for Military Operations, Department of the Army.

Unless otherwise stated, views or conclusions contained in this report are those of AIR, the editors, or individual authors and are not necessarily those of the Department of the Army, the Department of Defense, or any other department or agency of the U.S. Government. Furthermore, the U.S. Government does not necessarily endorse or concur with the statements made or the conclusions drawn by any of the authors or contributors to this casebook.

It should also be noted that many of the original source publications carry specific disclaimers on their mastheads. Therefore, no implication should be drawn concerning the original source publishers' views regarding any article published by them, without consulting the original source publication.

Comments and questions on this report are invited and should be addressed to AIR.

337413 FOR ON

FOREWORD

This collection of essays has been compiled by AIR using information in the open literature, unclassified government documents, and original contributions. In scope it covers the entire spectrum of military psychological operations (PSYOP). Appropriate consideration is given to related civilian activities as well as to relevant aspects of communication theory. Emphasis is placed on the entire operational field encompassed by such terms as "international communications," "political warfare," "cultural affairs," "psychological operations" (PSYOP), and "psychological warfare."

The editors have sought to illustrate the effective and noneffective uses of PSYOP and to describe the problems encountered and the solutions adopted by military and civilian personnel involved in PSYOP/Information activities during recent decades. Contrasting points of view were deliberately included in the casebook to provide a balanced as well as a general view of the state of the art. Some of the contributions may be considered as controversial, depending on the reader's point of view. Where copyrighted material has been quoted, permission has been obtained for its use.

Comments, corrections, additions, and suggestions for factual, interpretative, or other changes will be welcomed. They may be addressed to:

American Institutes for Research
3301 New Mexico Avenue, N.W.,
Washington, D.C. 20016

SOURCES

The types of selections that have been incorporated in this casebook include professional and scholarly publications, original contributions, foreign and domestic PSYOP-related material, excerpts from official memoranda and directives, lecture notes, letters, and newspaper items. An attempt has been made to ensure a reasonable geographic coverage by providing examples from all areas of the world. For example, Algeria, Burma, Cameroon, New Zealand, Nigeria, Portuguese Guinea, Taiwan, and Rumania are among the more than 30 countries treated in the text.

METHODOLOGICAL NOTES

General

The casebook is designed to serve primarily as background information for training in the field of psychological operations and as an introduction to the more important elements and principles of PSYOP. It is intended to serve not only as a point of departure for the uninitiated but also as a useful reference. The use of overly sophisticated material requiring a substantial social science background has been avoided. On the other hand, articles dealing in overly simplistic terms with principles painfully obvious to the reader have been excluded.

The editors have, however, intentionally included several somewhat advanced papers in the section on research in Chapter VII and on PSYOP effectiveness in Chapter IX. In Chapter VII, the selections give an indication of how sophisticated social science research can contribute to PSYOP. Similarly, the content of Chapter IX would have been incomplete and anachronistic without reference to the methodological thinking current in the 1960s and the early 1970s. It is believed that all the articles lend themselves to an understanding of the subject without an extensive background in communications research.

Secondly, most of the case studies have been purposefully selected to complement and supplement a standard reference in the field titled, *A Psychological Warfare Casebook*, written in 1956 by William E. Daugherty and Morris Janowitz. Changing perspectives of the nature and scope of PSYOP since that time, as well as changes in the politico-military environment in which PSYOP is carried out, have played an important part in the updating process. In this respect, the editors have given due weight to relevant events occurring since the publication of the PSYWAR casebook and have tried also to portray the new conceptions, methodologies, and techniques that have been developed to improve the effectiveness of PSYOP.

Thus, this compilation of case studies represents PSYOP generally in the 1960s, the situations experienced and the lessons learned in that decade. It is noted that although most of the incidents described took place between 1960 and 1972, some of them happened earlier but are best analyzed in the literature of the 1960s.

PREFACE

AIR, operating under a contract with the Department of the Army, has developed this two-volume anthology in the form of a PSYOP casebook. It has been prepared in response to a request from the Office of the Deputy Chief of Staff for Military Operations, Department of the Army.

PURPOSE AND SCOPE

This publication has been produced as a part of the overall research program undertaken by the Department of the Army to improve the capability of the United States Army to conduct PSYOP/information programs under a variety of circumstances in many different environments. The major focus of attention has been placed on psychological operations of military relevance, with special emphasis on the types of activities that may confront U.S. personnel in the two decades ahead.

In content, the editors have sought to cover the whole range of U.S. public international communications whether they be described as international information, cultural affairs, or psychological operations, and whether or not they be conducted by members of a military service or personnel of a civilian agency. The editors also have touched upon the ways in which PSYOP is employed elsewhere, with the hope that such material will serve to broaden the American understanding of how others around the world attempt to communicate effectively across cultural barriers and international borders.

COMMUNICATION THEORY AND PSYOP

The science of communication theory is relatively new; more than half of all the research, most of the important books and articles in the field, and most of the great figures in the study of communications have become well known only in the last twenty years. Moreover, increasingly for the last decade and a half it is in the context of communication theory that psychological operations—PSYOP—has been studied. Therefore, these volumes will include several timely essays on communication theory.

ORGANIZATION

The Art and Science of Psychological Operations is an anthology bringing together both original and previously published material. In effect, the essays comprise an analysis of the state of the PSYOP art. Some of them also provide conclusions and recommendations for the future. The individual essays, which are organized into chapters, deal with the nature and scope of PSYOP and communications; national policy and PSYOP; organizational and personnel matters; policy objectives and operational goals in Volume One; and PSYOP intelligence requirements, sources, and methods; social science research (including communication theory) and PSYOP; media, methods, and techniques; evaluation of effectiveness; and foreign ideology and propaganda in Volume Two.

Philosophically, the editors of this casebook have tried to indicate the new concerns in PSYOP, the changing conceptions of the field as a whole, and the trends in the use of new methodologies and techniques to improve its effectiveness. It is with reference to the change in conceptualization of PSYOP over the last fifteen years and to the trend of thinking in the early seventies that PSYOP is viewed in this book as communication. When the question is asked, "What is PSYOP?", the answers of different generations and different experts vary. Yet, as noted earlier, increasingly over the last decade and a half, psychological operations is studied in the context of communication. Although "persuasive" and "purposive" communications are the focus of this study, many scholars in the communications field argue that all communication is "purposive" and hence "persuasive." There is no need, in the context of present purposes, for this anthology to align itself with one or the other of these schools of thought.

Editorial Method

The desire to cover the "open" literature as thoroughly as possible and to make this an essential source for both military and civilian personnel interested in PSYOP and communications has made it necessary to be as concise as possible. It has therefore been necessary to excerpt many selections on the basis of relevance and concision. Except in the very few cases where the essays were "adapted," the excerpting is indicated by the use of ellipsis points in both copyrighted and noncopyrighted material. Only in the "original" and editors' essays were editorial changes, other than purely stylistic ones, made. Where necessary, the footnotes in each essay were renumbered, but not otherwise altered in form. The notes pertinent to a particular essay appear at the conclusion of that essay. Bibliographic citations for most sources used by the essay authors are found at the end of each chapter.

In as far as possible, the editors sought the consent of authors and organizations, even when their material was not copyrighted. The copyright holder, at least, was provided with a copy of the material in its proposed form. A particular note is made of the willingness with which publishers, editors, and authors responded to requests for permission to reprint material. In some cases, they even offered to update, substitute, or revise their articles, and when time permitted, the editors were able to take advantage of this. Some authors even suggested that they were flattered to be included. The undersigned, however, look at this the other way around: this book needed their contributions.

Inevitably in a work such as this—in which authors represent many nationalities, professions, and perspectives—the reader will find some material in spoken or translated English. For example, in those contributions illustrative of the day-to-day output of military units engaged in actual operations, a kind of clipped but useful military style is employed. Such a style was retained because it has a feel of immediacy and serves as an example of real PSYOP in action.

As in any anthology, one is advised to consider the article's original date of publication in his reading. A further result of the use of the case study approach is the fact that articles do not have an inherent order and flow. Although each selection has been placed in a chapter on the basis of its contributions to the topic covered in that chapter, an overly rigid linking of the several selections would be an arbitrary enterprise, misleading in some cases, since many contributions are illustrative rather than conclusive. The editors, therefore, have used the introductory comments at the head of each article to place the contribution in its situational context in many cases. However, this means, in some instances, that emphasis has been placed on aspects the contributing author did not necessarily consider to be preeminent, given his sometimes different purpose. Furthermore, because of the disclaimers carried in the mastheads of many of the original source publications, no implications should be drawn concerning the original source publishers' views on any articles published by them, without consulting the original source.

The chapters of this anthology, as well as the articles themselves, stand alone in large measure, even though references and cross-references reflect the interdependence of the various aspects of the PSYOP process as a whole. It is to be noted that because of the use of the casebook approach, style varies markedly from one article to another, providing a diversion from a single manner of expression.

Finally, a concerted effort has been made in the selection process for this compilation to stress the importance that the "PSYOP-related" fields have for effective psychological operations. Moreover, admittedly, controversial analyses, conclusions, and recommendations are found in several of the articles. These have been included not only for the purposes of the casebook already discussed, but to stimulate thinking. Essays featuring contrasting points of view are presented to provide a general idea of the range of thought of the individuals working in the field.

At any rate, this study looks at psychological operations analytically and conceptually as well as descriptively. Above all, every action and all inaction communicate. The goal in PSYOP must be to ensure that, through the combination of action and words, the desired message is the one that is transmitted. This is as true for nations as it is for individuals and groups.

THE ART AND SCIENCE OF PSYCHOLOGICAL OPERATIONS
CASE STUDIES OF MILITARY APPLICATION

CHAPTER VII

INTELLIGENCE AND RESEARCH

Intelligence and research support PSYOP in a number of crucial ways—from initial planning of a specific PSYOP program to the development of new methodologies for analysis and delivery. This chapter deals with both intelligence and research, the collection of information and its transformation, through research or analysis, into operationally relevant fact.

Intelligence, particularly, is so closely related to the process of effective persuasive communication that separating it from that process for purposes of study is exceedingly difficult. Utilization of intelligence output in some form is bound up in PSYOP planning from its earliest stages and continues to support PSYOP and to be affected by the PSYOP strategy until the process starts over again. Moreover, PSYOP intelligence cannot be neatly separated from other intelligence. Because it must meet both tactical and strategic requirements, specification of even the “essential elements of information” (EEI) overlaps information categories that intelligence is asked to address for other purposes, including politico-military planning and combat operations.

Growth of intelligence capability, particularly in analysis but to some extent collection as well, depends on a number of factors covered elsewhere in this casebook. (See, for example, chapters V and IX.) It also depends upon improvements in techniques resulting from social science research. Once again, in fact, all PSYOP, as all communications, looks to research for conceptual and methodological, as well as technological, innovation.

That intelligence and research are an integral part of PSYOP and central to the entire process, is attested to by the fact that most of the chapters in this casebook involve one or the other, and usually both. Their interrelationship is shown by the importance of the communications concept to the delineation of EEI. Meanwhile, social science research has constantly tried to refine communications models. Refinement supports analysis (Chapter IX), which is central to the processing of intelligence.

The last two decades have seen rapidly increasing social science research on communications. Transferring the results of this research to PSYOP, however, often requires a major effort. Yet, the commitment in the 1960s to utilizing this approach in PSYOP seems to be paying off: PSYOP appears to be on the threshold of important new benefits from the use of computer technology and the findings of communications research.

PSYOP INTELLIGENCE, INTRODUCTION

"A SURVEY OF PSYOP INTELLIGENCE" *

BY PHILLIP P. KATZ

From a PSYOP viewpoint, intelligence is the basis for understanding human actions. PSYOP is dependent on intelligence for the effective management of its programs, for obtaining current information about PSYOP targets, testing or obtaining feedback on message content and format, and measuring the effect of PSYOP messages and programs.

The purpose of this essay is to sharpen the focus of PSYOP essential elements of information (EEI) as related to intelligence requirements. It will emphasize the technical skills and knowledge that are needed to provide the PSYOP community with the answers to the EEI for planning, conducting, and evaluating PSYOP.

To this end, the essay will first discuss the general nature of PSYOP intelligence; second, outline the major focus of the EEI for PSYOP; and third, discuss the three major uses of PSYOP intelligence: target analysis, the testing of communication content, and the measuring of the effect of PSYOP programs.

NATURE OF PSYOP INTELLIGENCE

Since a wide variety of technical data and information is needed to manage, plan, and conduct communication programs effectively, PSYOP is dependent on intelligence for the effective management of its programs. Intelligence, from a PSYOP viewpoint, is the basis for understanding human actions. It involves a thorough understanding of all aspects of the audience of PSYOP targets; the ability to gauge the progress of current programs; and, finally, the capability to determine the overall effect of persuasive communications. Each will be discussed briefly.

First, anyone engaged in communication programs must know certain things about his audience; for example, who they are and how many are reading or viewing his messages. The PSYOP managers, planners, and communication or media programmers should understand the audience as if they were communicating face to face. Certainly, they must have a real understanding of current attitudes on a variety of appropriate subjects, and these attitudes should be considered as ranging, for example, from very hostile, somewhat hostile, neutral to somewhat friendly. On the basis of such knowledge, PSYOP communication programs can then help to:

- a. restructure hostile attitudes of selected individuals or groups;
- b. reinforce attitudes of friendly individuals or groups; or
- c. maintain the continued neutralization of those whose attitudes are unstructured and who are deemed "safe" if they remain neutral.

*Original essay by Phillip P. Katz.

It is obvious, however, that without a real understanding and knowledge of current attitudes on a variety of appropriate subjects there is no scientific way of determining whether progress is being made toward restructuring attitudes.

Second, when a PSYOP campaign is in progress it is very important to obtain constant feedback in order to know how it is going and what tactical changes, if any, are required. This requirement is substantial when the full range of communication media and channels is to be used. A careful and honest analysis is necessary in order to determine what messages and channels of communication worked well and why, what the mistakes were, and what can be done to avoid future errors and failures.

Finally, PSYOP intelligence is needed to measure the overall effect of communication on the attitudes and actions of selected targets.

Importance of Systematic Research

By building on carefully observed and evaluated experience, costly delays and failures can be avoided. In other words, in developing and implementing PSYOP programs, the first requirement is for a systematic approach. Systematic research is the most efficient way yet found to obtain dependable information about people and their environment.

The PSYOP communicator should be suspicious of the single letter or comment about the quality of a particular item of communication. The difference between the unsystematic gathering of information and research is that research, when properly designed and conducted, usually produces results that can be relied upon, whereas we have little idea how reliable less systematic information is. As Wilbur Schramm states:

The quality of information from and about the audience is of the essence. If it is to be useful, it must be based on facts rather than hunches; it must be adequate to allow for differences among parts of the audience, and for changes with time. This is why it is important that, so far as possible, [the] clear light of research be turned on the informational needs of the audiences.¹ (Emphasis added.)

MAJOR FOCUS OF ESSENTIAL ELEMENTS OF INFORMATION FOR PSYOP

Figure 1 depicts a concept model of the PSYOP intelligence process as it is related to program implementation. This dynamic process is based on the EEI.

The focus of EEI for PSYOP programs must be related to the total population base, because, as Gen. Vo Nguyen Giap put it, "That's the basis of our strategy that the Americans fail completely to understand."² Consequently, the EEI for PSYOP are the critical items of information about PSYOP targets (friendly, neutral, hostile) needed by a particular time to relate with other available information and intelligence in order to assist decisionmakers, planners, and media development personnel in implementation of communication (PSYOP) programs. They must include:

1. The definition of key audiences (both friendly and enemy) within the society
2. The beliefs, attitudes, opinions, and motivations of key audiences as individuals and groups
3. The analysis of current vulnerabilities of specific audiences within the society
4. The determination of message content and the most effective (best) communication channels to reach the target
5. The impact or effect of PSYOP communication

Each of these considerations will be discussed below.

Definition of Key Audiences (Friendly and Enemy) Within the Society

The need for definitive target selection has been firmly established. Again, it is emphasized that a country struggling for identification and vitally involved in nationbuilding usually does not have a single audience. In fact, in the United States, despite mass media and a highly developed educational system, there are many special groups based on geography, ethnic origin, religion, race, economic status, and social position. Certainly the attitudes of each group will vary on many political, social, and economic subjects. Therefore, it is important to consider the many diverse segments of the population and to aim communication programs to the specific groups and subgroups that one wishes to influence. Accordingly, specificity of target selection becomes an important first step in the development of PSYOP programs, with the intelligence community playing an important role in the selection of remunerative PSYOP targets.

Significant historical evidence shows that definitively and specifically worded communications are usually more effective. Although strategic programs are not concerned with a single hamlet or a small military unit, they should be concerned with significant religious groups, occupational subgroups, and specific military organizations as worthwhile targets. For example, major PSYOP target groups in an insurgency environment could be:

Host country civilians (friendly—neutral—hostile)

Insurgency-sponsoring-country civilians (friendly—neutral—hostile)

Incumbent military or paramilitary forces

Insurgent military forces

One of several further subdivisions of the host country friendly civilian target group could be by rural classification and occupational group, in this way:

Land owner

Farm owner-operator

Farm tenant-farm worker

Laborer (unskilled)

Laborer (skilled)

Fisherman

Merchant, Storekeeper

Figure 1. A Schema of PSYOP Intelligence.

Housewife

Priest, minister, monk

This, of course, does not imply that each category requires distinct and definitive media programing. However, based on the importance of the group or subgroup in the particular operational environment, a PSYOP program manager could decide to develop a special pamphlet, magazine article, radio program, or cultural drama team performance directed to any one of the hundreds of possible target categories.

Guidelines for the selection of PSYOP targets are based on several practical considerations: first, the importance of the target to the PSYOP mission. For example, a small rural minority group located in a remote and nonsensitive part of the country would be of little importance to PSYOP programs. On the other hand, a small but highly organized religious order, with its members strategically located throughout the country, could be of great use to PSYOP programs as key or influential communicators. In a similar way, a small minority group that occupies a strategic border area could be an important PSYOP target. Certainly, the PSYOP program manager and planner must understand their significance, as key communicators or important targets, and should direct appropriate communication to affect or restructure their attitudes.

The second guideline for target selection is based on the probability of attitude change. It was stated above that attitudes within a given group could vary from fanatically hostile to extremely friendly. Because it is generally recognized that PSYOP programs (especially mass media) will have little influence on fanatics, intelligence is needed to insure that the major PSYOP effort is directed to typical segments of the population. The atypical person or fanatic could be considered as a secondary or tertiary PSYOP target. For example, Henry V. Dicks, who was a leading PSYOP analyst during World War II, established the following five categories of response to Nazism among German males of military age:

1. Fanatical "hardcore" Nazis (10 percent)
2. Modified Nazis "with reservations" (25 percent)
3. Unpolitical Germans (40 percent)
4. Passive anti-Nazis (15 percent), and
5. Active anti-Nazis (10 percent) ³

From the above analysis, it appears that a majority of the German soldiers were politically neutral. No doubt this information was valuable to the PSYWAR planners and media programmers in that it provided the basis for the tone of political messages.

Beliefs, Opinions, Motivations, and Attitudes of Key Audiences as Individuals and Groups

If attitudes are to be restructured, reinforced, or neutralized, the first essential is to establish a baseline from which to provide an accurate assessment of current attitudes toward significant political, military, economic, and social subjects. The requirement is for more than hunches

or gossip. Hard scientific evidence about the reality of social situations is needed.

PSYOP is concerned with people's attitudes toward a variety of subjects: political ideologies; the enemy as a military force, as administrators, or as compatriots; and the friendly government, its bureaucracy, military forces, and aid. Also, it is important to understand the attitudes of particular age groups, social strata, and occupational groups. This information is needed for the development of a realistic communication strategy for specific PSYOP targets. As stated, important, significant, and typical audience samples should be used in assessing attitudes. There is considerable danger in assuming that the attitudes of one or two high-ranking defectors or several friendly civilians are typical.

Analysis of Current Vulnerabilities of Specific Audiences Within the Society

An analysis of current dissensions, fears, anxieties, complaints, and "gripes" within a selected target audience is vital in order to determine PSYOP vulnerabilities. Accurate and current evidence is needed about real or imagined complaints dealing with political, social, economic, or military subjects. Obviously, it is important that the complaints be typical ones.

Examples of fears and anxieties on the part of military PSYOP targets could be:

1. Close surveillance by comrades
2. Fear of punishment or reprisal against an individual's family
3. Fear of mistreatment, killings, or torturing of prisoners by the incumbent military forces
4. Fear of air and artillery bombardment
5. Anxiety over aerial surveillance

When assessed realistically and taken advantage of intelligently, many of the fears and anxieties mentioned above can be exploited as target vulnerabilities for PSYOP programs. The problem then becomes one of identifying them so that they can be exploited.

PSYOP vulnerabilities can be of long duration or of relatively recent origin. For example, a group can develop deep animosity, based on religious or racial prejudice toward another group. If the communicator adequately understands the nature of the animosity, it can be used for PSYOP exploitation. In this respect, the Viet Cong in their propaganda still equate the presence of U.S. forces in Vietnam with the colonial French forces, knowing, of course, that the majority of the people have a strong animosity toward both the French and colonialism.

PSYOP vulnerabilities are dynamic, and thus able to be reinforced or changed. By way of illustration, on August 8, 1968, the U.S. Ninth Infantry Division, reacting to a VC ambush, fired on the friendly hamlet of Yen Thuong, killing several innocent civilians. This incident made the people in the area extremely susceptible to anti-U.S. PSYOP. For example, rumors spread by the VC agents stressed that:

The Americans fired without provocation.

The Americans can't tell the difference between enemy and friendly, and open fire on all people in black pajamas. In this respect they are no better than the French.

The hamlet was caught in a crossfire in a fight between the Army of the Republic of Vietnam (ARVN) and U.S. forces.

The American helicopters "callously" opened fire on the hamlet.

Typical thoughts and attitudes of the villagers were:

The Americans are just like the VC—kill innocent people.

The GVN should order the Americans to stop undisciplined firing because too many people get killed. They (the Americans) are just like the French.

We used to think that the Americans came to help us (didn't they build schools and dispensaries?) but now the Americans show how they really feel toward the people.

The next morning (August 9) an ARVN political warfare team explained to the people of Yen Thuong and others in the general area that the Americans reacted to a VC ambush. They emphasized that, had the people informed or reported the VC activity, the tragedy surely would have been avoided. This message was also carried by the Vietnamese Information Service (VIS) to district towns and markets. This, plus the active concern of the government of Vietnam, the prompt medical attention given to the wounded, and the distribution of commodities and prompt indemnity payments by the Ninth Division tended to "cool" the situation and thus reduce this PSYOP vulnerability.

Determination of Message Content and the Most Effective Communication Channels

Writing about PSYOP during World War II, Daniel Lerner makes the significant point that the development of PSYOP themes (message content) is the one most crucial element in the PSYOP process. He also notes that this is the point at which the considerations of policy, intelligence, and the target are brought to bear upon the use of available media and channels of communication. Once there is a clear understanding of attitudes and PSYOP vulnerabilities for definitive targets, and with the knowledge of policy guidelines, there is nothing difficult or magical about the selection of thematic content for PSYOP messages. Of course, without an understanding of current attitudes, motivation, and actual vulnerabilities of specific issues, thematic content could be very mysterious.

It is apparent that content for PSYOP messages must meet a triple test: first, it must be consonant with PSYOP policy guidance; next, it should support one or more significant objectives as stated in the PSYOP plan; and, finally, it should be based on as accurate an assessment of vulnerabilities as can be determined by scientific analysis and evaluation of target information.

It is obvious that PSYOP messages should be programed over communication channels that are readily available to the audience. It is a wasted effort to prepare extensive and varied radio programs for groups

in areas not possessing radio receivers, or to develop large quantities of printed matter for an illiterate audience. Deciding on the most effective communication channel or channels to reach a PSYOP target is an important and critical step in the planning of PSYOP programs. There is no doubt that, in many environments, PSYOP is more than a loudspeaker and leaflet operation, and all available communication channels should be considered as PSYOP options.

The first requirement, therefore, is for a scientific analysis of current communication patterns for the target(s). Some of the questions are: (a) What channels are open? (b) What media are credible? (c) What media are most appropriate to the thematic content? (d) What channels are capable of reacting to appropriate time and space requirements? It should be made clear that a considerable amount of current data is required to adequately understand the various communication channels and the pattern of communication for PSYOP targets.

Measuring the Effect of PSYOP Communications

In evaluating the effect of communication programs, consideration should be given to whether the concern is for the short term, long term, or institutional (very long term) effect. As stated previously, if PSYOP programs are to be accurately measured, information is required from many PSYOP sources. Also, measurement requires the use of a variety of techniques, depending, of course, on the location, importance, and size of the PSYOP audience. Specific data-gathering techniques for determining the impact or the effect of PSYOP communication will be discussed in subsequent paragraphs.

Measurement can be quantitative, qualitative, or textual. Quantitative measurement can be based on the number of prisoners, defectors, or refugees who came in during the reporting period; or on the number of hours of radio or loudspeaker broadcasts; or on the number of leaflets disseminated. The second and third measurements are production indicators only and do not measure the true effect of PSYOP communications in restructuring attitudes. Even the first set of criteria are not necessarily valid indicators of PSYOP effectiveness because it is necessary to demonstrate a relationship between the PSYOP media output and actions, and the inflow of persons. Qualitative measurement can be based on specific cases of measured attitude change. Most of these data are obtained from verbal accounts gleaned from in-depth interviews or survey measurements of the restructuring of attitudes. In addition, textual or content analysis can be used to obtain PSYOP effectiveness clues from enemy documents, newspapers, periodicals, and broadcast monitoring reports, among others.

There is no doubt that the focus of PSYOP EEI for an insurgency environment is more complex than obtaining information about the "enemy and his environment." PSYOP targets represent a broad spectrum of the population, and the exploitation of the varied targets for PSYOP programs requires considerable technical knowledge. The follow-

ing paragraphs will discuss the utilization of PSYOP intelligence in the implementation of programs and the essentially technical method used to exploit major PSYOP information sources. The following discussion of the scientific techniques used to gather data from PSYOP information sources will expose the technical nature of PSYOP intelligence requirements.

UTILIZATION OF PSYOP INTELLIGENCE

Target Analysis (The Importance of Audience Research) ⁴

An important first step, in both commercial communication research and psychological operations, is to understand clearly the nature of the audience(s) and the communication patterns related to those audiences. This is accomplished through audience research or target analysis.

The spectrum of information to be derived from audience research is very wide. Five components will be discussed. First, as indicated previously, an important aspect of audience research is concerned with the communication pattern: How does information get to people? Who depends on radio or newspapers or other individuals for a given kind of communication? Who listens to the radio, and when? Who can pick up leaflets, and when? Who goes to the movies? Who reads magazines, and what kind? Specifically, audience research is necessary in order to find out what channels or combinations of channels to use for a given communication purpose.

Audience research is also used to find out what skills an audience has in reading or listening, and how the audience is likely to interpret a given text, illustration, picture, or slogan. This kind of data is essential so that the communicators will have the needed information to encode or prepare messages that are meaningful to the various PSYOP targets.

Another important point is that audience research is vitally concerned with the credibility of information, sources, and channels. In short, what kind of messages are likely to be believed, accepted, and lead to the desired action.

In addition, PSYOP media programmers require a clear understanding of how messages are understood or perceived, what part individuals and groups play, and how perception gives rise to the restructuring of attitudes and eventually a change in behavior.⁵

Moreover, audience research is necessary in order to find out something about the social organization of the audience, that is, to answer such questions as: Who are the opinion leaders (key communicators)? How are decisions on a variety of significant subjects likely to be made? What is the role of the primary group and the social organization in the communication process? This information is needed, specifically, to develop a rational communication strategy and to better understand what use to make of interpersonal communication, mass communication, and mixed strategies in the development of the campaign.

It is very important in attempting persuasive communication to really understand the attitudes of people as individuals and as members of social groups.⁶ To a degree, Washington research can provide significant data, but, because target analysis is dynamic and should be based on the reality of "today's attitudes," the answer to the above questions can be obtained only after current field research.

The vital importance of audience research is clearly stated in a document prepared by the United States Military Assistance Command, Vietnam (USMACV). It states that:

Adequate audience analysis is the key to effective psychological operations and the basis for audience analysis is a *sound responsive intelligence gathering effort* [emphasis added]. Audience analysis provides the psyoperator and commander with the vulnerabilities of specific target audiences; susceptibilities to a variety of PSYOP appeals, available communication channels. With this information, the psy operator can develop PSYOP objectives. [Author's note: PSYOP objectives are provided by the command: the "psy operator" develops appropriate themes for media implementation.]⁷

It is apparent that target analysis is necessary in order to identify meaningful population groups and subgroups as specific PSYOP targets. Furthermore, target analysis provides important clues to the attitudes of the selected audiences prior to exposure to PSYOP messages. In addition, it is important because it provides the data needed to anticipate what resistance might be met to communication content and to determine what message content and communication strategy might be most meaningful and effective. In sum, target analysis (through the use of surveys and other data-gathering techniques) tends to bring the selected targets closer to the PSYOP source, for example, the radio scriptwriter, the man at the microphone, the artist or illustrator, the newspaper copywriter or leaflet writer, and, of course, to the PSYOP cadres. Thus, it is evident that audience research is a broad and basic requirement of PSYOP programs.

Testing of Communication Content

The need for testing communication content before the message is disseminated is clear: After the message leaves the channel, it is lost to the PSYOP media programmer (the source); therefore, in the communication process, the source wants to know whether he is in tune with his audience, that is, if his messages are properly understood by the receiver.

In testing messages it is important to check the respondent for psychological as well as sociological representativeness (age, sex, occupation, education, and so forth). These two items should not be confused. Prisoners of war, for example, while they may be much like their uncaptured comrades from a sociological point of view, are very different from them, psychologically speaking. They are relatively safe in a prisoner-of-war compound and no longer have the physical fears associated with the combat area; also, they are no longer under the strict influence of their political officers and the military primary group (squad and platoon).

Consequently, the fact that a persuasive message, directed to a hostile target, scores high on an initial test with prisoners of war or defectors, does not necessarily mean that it will "bring them in." As stated, the social environment in the prisoner-of-war camp is different from that of the target area. In addition, those selected for testing are usually neutral or friendly to the source; they are not in a hostile communication environment; and their primary group will usually be sympathetic toward the source. Hence, while they may be fair subjects for testing some kinds of communication (that is, general information messages), they are not suitable for testing certain persuasive messages. This is also true of political refugees.

Alfred de Grazia, who made a thorough study (1953) of target analysis and propaganda media, states that:

Although frequently useful as sources of intelligence concerning events and conditions in areas inaccessible to psychological warfare, they (POWs) may not share the attitudes and temper of their former compatriots. The very fact that they chose to flee, and are now situated in such different surroundings affects their perspective and reduces their value as pretest subjects.⁸

De Grazia also stressed that in testing there are no definitive rules. Each instance is unique, and before an estimate can be made of the reliability of a proposed test, careful consideration must be given to the nature of the communication, the type of subjects available, and the overall psychological atmosphere in which the test is to be conducted.

The following paragraphs will discuss some techniques that are used to test or obtain feedback in PSYOP communications. In addition to testing, the techniques are used for other purposes such as attitude measurement. Four techniques will be discussed: (a) the general sample survey, (b) the panel as a survey tool, (c) the in-depth interview, and (d) informal media testing as part of an interrogation or interview.

The General Sample Survey

The sample survey is perhaps the one best systematic method for determining effects of media content. Its application in military PSYOP is, of course, limited to those targets that are accessible to the surveyors. Certainly, in an insurgency environment, this technique can be used more frequently than in conventional military situations.

The sample survey is usually conducted during and after the PSYOP campaign. By asking significant questions of a relatively small sample of persons, scientifically selected to insure a certain representativeness, the survey can obtain highly accurate information on the percentage of the audience actually reached by various communication channels, and how the audience is responding to the communication. The purposes of the survey technique in PSYOP testing are to determine if the messages are understood, to obtain clues about the credibility of content, to determine if the message evokes the desired response, and finally, to find out whether it has provoked any undesirable effects.

In considering the use of surveys in an insurgent environment, it is pertinent to note certain observations made by one of America's leading attitude research organizations. In its introduction to a 1967 attitude survey conducted by the Center for Vietnamese Studies, this firm commented that one major problem would be respondent suspicion of interviewer motives. As a result, it was thought respondents might alter their answers.⁹ Such data can either be taken as a direct indication of the sample population's attitudes and beliefs or

the data can be interpreted comparatively. That is, the majority of the respondents need not express a particular attitude for it to be regarded as an important finding. Whether a given datum is meaningful or not depends in part on the degree of support derived from other parts of the same study. To utilize this more modest definition of the study is to say that the findings *can yield considerable insight into the feelings of the people but will provide projectable information on the whole population within fairly broad tolerance limits.*¹⁰ (Emphasis added.)

Finally, the study concluded that the interviews did constitute an acceptable reflection of reality.¹¹

There is no doubt that there are many problems in polling overseas. In some countries, it is not feasible to go into the countryside; in others, especially those with autocratic governments, the population is afraid to answer questions, telling interviewers, when they do talk, what they think their government would like to hear them say. The best clues of the extent of bias are to be found in the survey findings themselves. Thus, for example, there have been surveys taken in semipolice states which revealed monotonously regular approval of all government actions at close to the 95 percent level, clearly suggesting the absence of freedom of expression.

The United States Information Agency is primarily responsible for conducting attitude surveys overseas. The world opinion surveys conducted by USIA are especially significant to PSYOP communication. They are available and used by other agencies of the government, including the Department of State, the Agency for International Development, the Department of Defense, and the Arms Control and Disarmament Agency. The surveys cover questions from basic values to specific reactions to programs, media, or activities. Interviewing is usually done by indigenous personnel, sometimes by locally run public opinion organizations, and administered by contract professionals under the guidance of USIA staff personnel. Thomas Sorenson notes that a "confidential" policy statement spells out the use of surveys by USIA as follows:

We use the public opinion poll abroad, in concert with other methods, to measure (1) understanding of and support for important U.S. policies and actions, (2) the standing in the public mind of the U.S. compared to . . . other nations with respect to relative military power, scientific progress, economic growth, and the like, (3) attitudes on questions and personalities . . . of significance to this country in the conduct of its foreign affairs, (4) the aspirations, fears and prejudices of the USIA target audiences, and (5) *the importance and credibility of the various communications media in different countries for different audiences.*¹² (Emphasis added.)

The scientifically planned survey is an important tool in providing data and material for the answers to PSYOP EEI and in testing the contents of PSYOP communications. It is important, however, that the surveys be programed for the widest variety of urban rural targets.

It is apparent that use of sampling procedures and implementation of attitude or opinion polls requires demographic data and professional skills. It is beyond the scope of this essay to consider the tools of field research and the specific techniques of the sample survey.

The Panel as a Survey Tool

The panel is a group of people chosen to represent in a scientific way some larger population segment. The difference between the panel as a testing or measuring instrument and the survey is that the panel involves interviewing the same population segment not just once but repeatedly at regular intervals.

This technique allows for the gathering of a great amount of relevant data, and provides for a better comparison of long-run and short-run effects on attitudes and behavior. The validity of the results is highly dependent on the scientific selection of the panel to insure that it represents a demographic cross section of the target or targets.¹³ For example, the requirement might be for a series of panels that scientifically represents the major social groups and subgroups. These could include separate panels for communication directed to urban civilians, rural civilians, enemy military and paramilitary forces, refugees, and the like.

The survey method of data collection requires free access to the audience, with the members being checked for psychological representativeness. That is, are they the best and most recent sample available to represent the psychological environment of the target audience? It also requires skilled handling of what is called the "interviewer effect," that is, biases introduced into the responses of the panel members as a result of their repeated interviewing and consequent heightened awareness of the issues.

The In-depth Interview

An important technique used to obtain PSYOP intelligence, the in-depth interview is primarily used for post-testing and measuring attitude change and effect. Essentially, the in-depth interview is an outgrowth of the psychoanalytic interview, but is somewhat more directive, and of course not therapeutic in its aim.

During World War II, Dr. Henry V. Dicks (LTC, Royal British Medical Corps) was the first military psychiatrist to use in-depth interviews to support PSYOP programs. As in the psychoanalytic interview, the objective is to put the respondent at ease and get him to express himself as freely as possible on the subject at hand. If the interview is to progress satisfactorily, the psychological atmosphere must be permissive, and the respondent must be made to feel that nothing he says will be "used against him" or embarrass him in any way.

The purpose of the in-depth interview is to give insights into the deeper meanings that some objects and events hold for the respondent and to clarify the psychological process and mechanisms by which these meanings are formed, perpetuated, and changed. In order to gain insights of this kind from the in-depth interview, the interviewer must possess considerable psychological sophistication as well as a good grounding in the principles of modern dynamic psychology. Clumsy and aimless in-depth interviewing produces nothing, and its indiscriminate application by amateurs can result in more confusion than insight.

Informal Media Testing

The testing techniques discussed, to this point, are very sophisticated and require technical knowledge in both the planning and implementation of their use. Surveys and in-depth interviews should be methodically planned and tested prior to implementation. This takes time—something often lacking to a PSYOP programmer. Often an immediate test or evaluation of a leaflet or other item of communication is required. Therefore, if operational pressures do not permit the use of the formal techniques discussed above, the PSYOP programmer might elect to test the communication informally on:

- Members of his local national staff, or

- An accidental urban or rural sample, or

- An accidental sample of prisoners or returnees, or on all three

At times, informal testing or evaluation is accomplished after a leaflet is printed and distributed.

One respondent, a 22-year-old former Viet Cong and teacher of “politics, culture, and indoctrination,” made the following significant comments concerning PSYOP leaflets:

I propose that you use suitable terms in preparation of leaflets. It is natural that both sides try to abuse each other but we must speak ill of our opponent in an elegant manner. The picture must adhere to the truth because the readers will compare them with reality. If they find out that the leaflets are excessive, they will lose confidence. Most of the men from North Vietnam have a good culture and their general education level is equivalent to Junior High School, therefore, they can make a clear cut observation and analysis. Thus special attention must be paid to the text as well as to the pictures in the leaflet and efforts made to adhere to the truth as far as possible.¹⁴

This kind of feedback, obtained during an interrogation or interview, is useful to PSYOP media programmers. As noted before, however, it must be considered together with other data.¹⁵

Measuring the Effects of Communication

Variables

Measuring the effects of PSYOP communication is, of course, primarily of interest to commanders, planners, and communicators. The effect of communication is directly related to its purpose. It is difficult to learn the effect of persuasive communications, especially about targets in hostile areas, because, apart from the question of audience accessibility, media

effects are so diffuse and so variable in character that they defy simple analysis or uniform description. A complete inventory of the prerequisites needed to measure effects of PSYOP programs is yet to be formulated. In this regard, de Grazia presents some idea of the complexity:

... responses to communications may be specific or general in nature; they may be of short or long duration; they may be of high or low intensity. In some instances a communication may produce a significant change in attitude with no accompanying change in observable behavior. In other instances, behavior appears to change markedly without any appreciable change in attitudes. Some intended effects may be produced in some people by carefully planned messages. In other audiences, the same messages may produce precisely opposite effects, or no effects at all. In short, the question that is of most interest to the psychological warfare operator, namely, that as to the target's intellectual and emotional responses to his messages, *is still largely unanswered by students of the human sciences.*¹⁶ (Emphasis added.)

Although assessment is difficult, the data-gathering techniques and procedures discussed in the previous paragraphs are relevant in discovering whether communication media stimulated behavior or had a measurable effect on restructuring attitudes. As stated previously, it is important to consider attitudes as gradients or points along a continuous scale.

In analyzing the effect of PSYOP communication and strategy, there are many considerations. A partial list of the variables includes:

- a. The type and location of the target
- b. The number and variety of channels open to the target
- c. The degree of program saturation over the various channels. (It is apparent that a PSYOP campaign that is given unlimited media support and money is likely to have greater impact than a limited effort.)
- d. The degree to which the messages conform to group standards.

The techniques discussed in regard to target analysis and communication testing are applicable in measuring the effect of PSYOP programs. Where possible, a combination of data-gathering techniques should be employed. Some social psychologists profess that it is rarely possible to predict action behavior from "paper and pencil" (survey) responses. However, Samuel Flowerman maintains that:

since all measurements, even in the physical sciences, are indirect measurements, we commit no violence to scientific method by urging additional criteria for estimating effectiveness of protolerance propaganda. . . . (Perhaps effectiveness in social psychology is like infinity in mathematics; we may approach it but never attain it. Yet this does not stop us from making progress.) We can accept as evidence the satisfaction of a reasonable number and kinds of criteria of effectiveness. Such reasoning would also enable us to make better comparisons between two different sets of propaganda symbols.¹⁷

Criteria of Effectiveness

Six indicators of the effectiveness of PSYOP will be discussed.

1. *Immediate Recall.* Other things being equal, the content of messages that are immediately recalled is more effective than that of messages that are not recalled (forgotten).

However, it appears that unfavorable messages as well as highly favorable messages are liable to be remembered.

2. *Delayed Recall*. Other things being equal, PSYOP messages that are remembered for a long time after exposure are more effective; usually the longer it is recalled the more effective the message.

3. *Repetition*. Other things being equal, messages that are repeated to others are more effective than those that are not so repeated. This can be developed further to take into account the circumstances of repetition, the number and kind of persons repeating the message, chains of repetition, and accuracy of repetition.

4. *"Paper and Pencil" Behavior (Attitude Surveys)*. A significant measurement of the effectiveness of PSYOP messages and programs can be obtained from the responses to well-constructed questionnaires (surveys) and the development of appropriate scales for measuring key indicators of attitudes. For example, questions pertaining to the key attitude indicators would be included in a programmed survey for a particular social group or geographical area, and the data would be collected prior to the initiation of the PSYOP program. After the data are collected, PSYOP target and effect analysis personnel would retrieve the data on the attitude indicators and it would be indexed according to an appropriate scale. This would represent an attitude rating prior to the initiation of the PSYOP program. Subsequent surveys conducted at appropriate intervals during the campaign would provide information about the progress or lack of progress concerning attitude change.

5. *Physical Response to a Message*. It was emphasized that the primary purpose of PSYOP is to influence the behavior of the audience; therefore, positive audience action is the final indicant of the effectiveness of PSYOP communication. When specific action, such as writing letters, voting, or defecting, is called for, and takes place, then the effectiveness of a given item of communication (or campaign) becomes apparent, although, of course, it must be demonstrated that the action was motivated by the message and not by some other factor in the situation. Sometimes, PSYOP messages serve as stimulants for future action.

6. *Content Analysis*. Indicators of PSYOP effectiveness can often be obtained from a content analysis of the monitoring of radio communication, newspapers and other publications, captured documents, enemy propaganda, and in-depth interviews and other intelligence reports.

CONCLUSION

In sum, PSYOP intelligence is vitally important to the development and the implementation of meaningful PSYOP programs. It is used to obtain current information about PSYOP targets, to test or obtain feedback with regard to message content and format, and to measure the effect of PSYOP messages and programs.

PSYOP Intelligence Requirements

Initial treatment in the intelligence portion of this chapter is given to intelligence requirements for psychological operations, specifically, the role of intelligence, planning requirements, language and interpretation, and, finally, timeliness.

The role of intelligence in PSYOP is similar to the overall role of intelligence in military operations. Although conceptually narrower—clearly, PSYOP intelligence concerns only that information relevant to PSYOP and excludes all other military intelligence—the intelligence potentially useful for effective psychological operations covers an extremely wide range of subject matter, probably broader than that useful for any other military task. This is evidenced by the EEI for PSYOP intelligence.

The role of doctrine and policy in PSYOP intelligence is to place limits on methods or sources, or to provide guidance with respect to the utilization of certain methods or sources. Doctrinal constraints are important, but our involvement in Vietnam clearly indicates that more emphasis needs to be placed upon the refinement and modification of doctrine and policy based upon experience in the field. (See Chapter III.)

The solution of the language usage problem can be the difference between successful and unsuccessful PSYOP campaigns. It is essential to use the idiom correctly. (See Chapter V and Martin F. Herz, "Lessons From VC/NVA Propaganda," Chapter VI.) It is also necessary to insure that the dialect is properly selected for the target group. The context of the language as used must also be proper in the minds of the target audience. The role of research in assuring these factors is to validate the use of the language, idiom, and dialect. Native language facility on the part of PSYOP personnel is highly desirable, but hardly ever exists; therefore, the use of interpreters is common. There are many problems associated with utilization of such an intermediary, among which are accuracy, target audience perception of the intermediary, and social position of the intermediary.

Timeliness is a major factor in both the production and the content of intelligence. While old data are not necessarily invalid data, constant vigilance must be exercised to insure that changes have not in fact invalidated intelligence material. For many categories of PSYOP intelligence—categories relating to the culture and economy of the audience, for example—change will not be rapid.

PSYOP depends upon adequate intelligence. Without it, adequate targeting, choice of the optional channel of communications, and message selection can never be systematically attained.

PSYOP ESSENTIAL ELEMENTS OF INFORMATION*

BY THE 7TH PSYOP GROUP

This enumeration of the PSYOP EEI analyzes the information required for effective PSYOP planning and comments on current military information collection activities relevant to psychological operations.

SUMMARY

Psychological operations research and analysis entails three major functions: Analysis of the target area; propaganda analysis; and evaluation of PSYOP media output through pre-testing and post-testing, and determination of reactions of inhabitants of the target area. Psychological operations research and analysis has particular information requirements which are different from those of combat and tactical intelligence. Briefly, psychological operations intelligence research and analysis needs to know about what it is like to live in the target area, about all aspects of life there so that psychological operations media output (leaflets, radio broadcasts, loudspeaker broadcasts, and so forth) can be developed which are suitable for the target area. This particular approach requires a large amount of detailed information about the life patterns and living conditions of people in various occupations and social levels in the target area.

*From "PSYOP Intelligence Notes," No. 62, by the Target Analysis Section, 7th PSYOP Group, 3 December 1968.

ESSENTIAL ELEMENTS OF INFORMATION

At present information collection by military components is mostly centered around the obtaining and reporting of information about strictly military subjects. Only a small part of this kind of information has been found satisfactory for use in support of psychological operations. This brief guide tells the kinds of information which are useful in support of psychological operations. The following is a suggested list of PSYOP essential elements of information:

Social Organization. Composition of the society by ethnic group, age, sex, occupation, role, status, and so forth. Distribution of people by occupation and territorial location (that is urban, towns, villages). The family in the society. Method of reckoning kinship in the society (names of relationships used). Social stratification—levels, ranks, classes, and prerogatives, duties and privileges of each social level. Tensions between social groups. Methods of social control. Attitudes of each class. Suitable psychological operations messages, themes, and techniques. Best delivery techniques for psychological operations messages for each group. Accessibility of each group to PSYOP media output.

Daily Routine. Specify in detail all activities performed by a person on normal work days and on special days, giving approximate timetable, including the hours for rising and retiring, beginning and ending work, preparing and taking meals, time spent in recreation, meetings, shopping, cooking, washing, cleaning and conversation. Include seasonal variations, for example, the farmer's year may be broken down into the periods of preparation of fields, planting, growing season, harvesting, and the off season. Different routines for people in various occupations such as farmers, factory workers, miners, school children, army personnel, government workers, and administrative personnel at various levels; men, women, and children may have different patterns.

Habitual Customs. Habits in the individual's household with regard to food, sleep, bodily functions and cleanliness, and all forms of normal or customary behavior. Gestures. Postures. Bodily positions.

Etiquette. Standards of behavior and actual or normal behavior in relations between individuals, including with other members of the farm household and village, fellow factory workers, officials in higher positions, and the like. Include salutations, forms of address, special gestures, rules of hospitality, and politeness toward others in accordance with rank, age, sex, and relationship. Special forms of behavior and treatment of higher officials, old people, children, fellow workers.

Training and Education. Treatment and training of children. Children's activities. Nurseries, kindergartens, primary, and secondary schools—age of attendance, activities, subjects, text books, and other pertinent matters. Acquisition of traditional cultural patterns. Training in bodily habits, postures, language. Manifestations of fear, anxiety, and affection in children, and how handled by adults.

Life Cycle of Individuals. Conception, contraception, pregnancy, abortion, birth, infanticide, suckling, and naming. Childhood. Puberty. Adolescence. Sexual practices—including normal patterns and development, deviations from normal development, frigidity, impotence, bestiality, prostitution. Courtship. Age at marriage. Betrothal. Types of marriages and ceremonies. Divorce. Adulthood. Old age. Death. Suicide. Burial technique and disposal of the dead, including normal deaths, dead from epidemics, soldiers in war, enemy soldiers, infants, and other related matters. Ceremonies held at various stages of life cycle, including birth, transition from puberty to adulthood, marriage, attainment of old age (for example, 60th birthday in Korea), death, burial, and post-burial.

Political Organization. Systems and types of government at national, regional, provincial, township, and village levels. Political leadership and organizations at all levels. Prerogatives of leaders, special treatment. Obligations of leaders. Councils. Quasi-political associations, units, and organizations. Crime, law, and justice.

Economic Organization. Property. Types of property (real estate, household and occupational equipment, personal effects, ritual objects, foodstuffs, livestock). Rights to utilization of property. Inheritance. Land tenure. Production (industry, trade, agriculture, herding, fishing, hunting, and collecting). Seasonal variations of production. Participants in production. Complaints and stresses of people engaged in production. Organization of work. Distribution of products of the various forms of production. Stores and shops at all levels. Availability and scarcity of food and consumer goods. Stocks and prices of goods. Farmers markets. Monetary system. Remuneration for labor. Consumption of items produced, for instance, final uses. Rationing systems. Attitudes of people to all of above.

Ideological and Religious Beliefs and Practices. Beliefs about men and about the supernatural. Ceremonies, rituals, meetings, and detailed description of proceedings. Sacred or venerated objects. Culture heroes. Myths. Religious organizations and societies. Secret societies. Beliefs associated with warfare.

Knowledge. Methods of recording and communications (writing systems, languages, dialects, tape recorders, shorthand systems, motion pictures, photography). Methods of counting and reckoning. Measures of weights, distance, surface, capacity, time, and value. Seasons, weather, and climate. History and myths. Culture heroes. Stories, songs, and sayings.

Communications. TV and radio communications (numbers and types of broadcasting facilities). numbers, types, and distribution of receivers. Wire-diffusion systems. Publishing of books, magazines, of newspapers and their distribution. Literacy. Availability of foreign language published materials. Motion picture industry (languages, types of films, and distribution). Languages and types of recorded materials. Public information organizations in area and content of media. Censorship. Attitude,

reaction, and credibility of people to indigenous public information. Distribution of non-indigenous propaganda materials (leaflets, radio broadcasts, and loudspeaker broadcasts). Attitude, reaction, and credibility among local people. Numbers of people who listen to or see non-indigenous propaganda. Word-of-mouth communication and gossip systems. Meetings, speech making, and other modes of information dissemination. Postal system. Telephone system. Telegraph and teletype systems.

Personal Care and Decoration. Cleanliness. Perfumes. Sanitation. Personal appearance (hair-dressing, nails, teeth, cosmetics, tattoos, clothing, personal ornaments, recognition marks, and visible symbols of rank, emblems and badges, membership in organizations, status).

Housing. Patterns of housing in cities, towns, and villages. Description of interiors and exteriors of houses. Lists of and placement of all objects found in each room and in and around houses. Functions of each room of a house or apartment and facilities near the dwelling. Ownership of houses. Who lives in houses—family relationship. Assignment of houses. Arrangement of houses in villages. Other structures in villages. Urban dwellings—houses, apartments, and rooms. Relation of dwelling to place of employment. Shortage of houses. Attitude of people to housing.

Food. Foods and their preparation. Seasonal variations. Availability of food and drink. Preservation and storage of food. Cooking techniques. Nature and times of all meals. Condiments. Special customs. Rationing of food. Forbidden food. Food preferences. Water and other liquids consumed—source, availability, and preparation. Stimulants and narcotics. Attitudes of the people relating to all of the above.

Travel and Transportation. Modes of travel and transportation. Vehicles. Routes and roads. Restrictions and documentation related to travel and transportation. Resettlement of population. Migration.

The Arts. Drawing, painting, sculpture, music, musical instruments, dancing, singing, literature, poetry, drama, games, and amusements. Descriptions of the preceding. When and where do they take place? Sponsorship of such activities.

Health and Sanitation. Medical Practices. Modern and traditional medical techniques. Personal hygiene. Training of practitioners. Medical organization and system. Availability of medical service and supplies at all levels. Attitude and reaction of people to medical services.

THE NVA SOLDIER IN SOUTH VIETNAM AS A PSYOP TARGET*

BY THE JUSPAO PLANNING OFFICE

The presence of soldiers in a country other than that of their origin, even when this country of deployment has had a long history of close cultural contact with their country of origin, offers a variety of themes to PSYOP unavailable for use against indigenous forces.

*Excerpts from PSYOPS POLICY, No 59, 20 February 1968 JUSPAO Planning Office, Saigon, Republic of Vietnam.

PROBLEM

To focus PSYOP more effectively on the North Vietnamese Army (NVA) soldier in South Vietnam; devise surrender or defection appeals for dissemination to NVA units in South Vietnam (SVN); and provide field personnel with information on the most recent vulnerabilities and deterrents to surrender or defection in the psychological makeup of the NVA soldier.

DISCUSSION

The North Vietnamese soldier in South Vietnam presents a particularly difficult target for GVN/US PSYOP aimed at inducing surrender or defection. He has a relatively high state of indoctrination, reinforced by a range of psychological controls wielded by the cadre which include self-criticism sessions, the three-man cell, and the endless repetition of communist themes. A contributory reason for the resistance of the NVA soldier to Chieu Hoi inducements is that unlike the Viet Cong, defection for most does not hold the promise of an early family reunion.

Moreover, unlike the VC guerrilla who may be a teenager conscripted from his hamlet environment by VC "recruiters" and sent into battle without much party schooling and political indoctrination, the NVA soldier is the product of a closed, totalitarian society, subjected to communist indoctrination from his earliest school days. This makes him more resistant as a PSYOP target. Unlike the VC he finds himself fighting in a region unfamiliar and semi-antagonistic to him, usually in relatively uninhabited areas and with little chance for contact with the civilian population.

There are three options that should be pointed out to him in US/GVN PSYOP messages:

The first is to rally, take advantage of the Chieu Hoi program and in short order become a free citizen of the RVN. (Until further notice, only defection appeals as outlined in PSYOP Policy #57 of 8 Feb 68 are to be observed.)

Second is to surrender as a prisoner of war and await repatriation at the end of the war in the safety and relative comfort of a prisoner of war camp.

As a third alternative, until the opportunity of either rallying or surrendering may present itself, NVA soldiers should be counseled to devote all their efforts to individual survival rather than getting killed or maimed for an unjust cause. Malingering, the avoidance of risks, passive resistance to the exhortations of the cadre should be stressed as a way to survive the war. Even a partial success in this PSYOP effort will contribute to shortening the war by reducing the combat effectiveness of NVA units.

While a decision to rally will be personally more advantageous to the individual, it may involve too direct a renunciation of country, family and all past training to form the substance of a viable PSYOP appeal in every

instance. Whichever of the alternatives are offered to NVA soldiers in our PSYOP messages, the vulnerabilities which they exploit remain the same.

The NVA as a PSYOP Target

. . . . The most recent study shows that the age of infiltrators has dropped significantly. Prior to 1966, the most frequent age at infiltration was 22 years, with a lesser age peak for cadre at 25. By mid-1967 the age distribution had changed to a very sharp concentration at 19 with a much lesser age peak (again cadre) at 26 years. Further age drops are indicated. For instance, prisoners captured in July 1967 stated that 60 NVA replacements received by the battalion in June had all been 16 or 17 years old. Moreover, the composition of the NVA force has undergone a change from a majority of volunteers to over 70 percent draftees or former servicemen recalled to duty.

There is also some indication that soldiers with relatives in the South were included for the first time among the infiltrators, by mid-1967, although no estimate of their number is available. Previously, the NVA avoided sending to the South men whose immediate families regrouped to the South in 1954.

These factors would appear to reduce to some degree the responsiveness of the latest NVA infiltrators to cadre propaganda and provide greater opportunity for exploitation of vulnerabilities by US/GVN PSYOP techniques.

Vulnerabilities

The vulnerabilities themselves have not changed significantly over the past two years but they may have been intensified somewhat due to the change in the makeup of the force.

Separation from families, the hardships of infiltrations, fear of allied arms, and perhaps most significantly, the contrast between what they have been told by the cadre and what they experience themselves, are major exploitable weaknesses. For example:

NVA soldiers, told that most of South Viet Nam is already "liberated," come South and find that they must hide in the jungle and are stalked continuously by the heavy weapons of their adversaries.

They have been told by the cadre that the side which controls the people will win the war and that the VC have already won the support of more than two-thirds of the people and control four-fifths of the land. But instead of being welcomed by the people, NVA soldiers find that they must live in hiding, cut off from the people, who are sullen and seek to avoid contact with them. the recent NVA-VC Tet offensive, which failed in its aim to induce a general uprising, reinforces this vulnerability.

They have been force-fed in training and throughout the constant indoctrination sessions with tales of NVA/VC victories and GVN/U.S. defeats. According to the cadre, Americans have low morale and fighting

skill, cannot stand the climate, think only of going home. ARVN troops are reported to be poor fighters who are despised by the people. In the face of these optimistic forecasts, NVA soldiers find that they are subjected to incessant pounding and that the VC units to which they are attached or with which they operate are forever withdrawing from areas or hiding in the jungle.

They are told that the Americans, like the French before them, have enslaved the people, who are living in misery, exploited by the colonialists and the landlord class. These are the lackeys of the Americans and compose the puppet government in Saigon. Instead, on the rare occasions that NVA troops come in contact with the civilian population, they find them relatively well off, in possession of more material goods than are available in the North, and not interested in being 'liberated.' Though US/GVN media messages are in part discounted because of the training and indoctrination of NVA soldiers, our PSYOP products with which they come into occasional contact (leaflets, radio broadcasts, posters) may also give them pause for thought if they project convincingly an image of SVN well-being and confidence.

The party's concern for the soldiers is a standard indoctrination topic, the gist being that the party and the country are proud of the fighter who will be given a hero's welcome when he returns after the Americans are driven out, or if wounded along the way, he will be well taken care of, or if killed in battle, he will die a hero's death and will be buried with honor and live forever in the grateful memory of his countrymen. But NVA soldiers fear that they will get little care if wounded, might even be left behind on the battlefield, and if killed, might be hastily buried in unmarked graves, which their families will never find. They have this fear because they know that this is what happened to some of their comrades, contrary to what they had been taught to expect.

There is almost no mail connection with their families in the North. While several years ago letters could be sent to immediate families without limitation, latest interrogations state that only one letter on a single sheet can be sent North every six months, and mail from the families is similarly sparse, censored, and uncommunicative. This deprivation is intensely felt by the soldiers, most of whom despair of ever seeing their families again.

Deterrents

The endless repetition of the same communist themes by the cadre, by official publications and training documents, and in the cadre-managed self-criticism sessions sets up near automatic responses along the lines desired by the party, irrespective of objective reality. Because of this pattern, there is a tendency to reject Allied arguments out of hand. It is hard to break through to the NVA soldier with PSYOP messages because of this mental conditioning.

.... The capability of the party cadre to instill a spirit of self-sacrifice in

the minds of the troops is another of the strengths of its propaganda. To endure hardships, to be wounded or die for the just cause and live forever in the memory of the people as a hero of the revolution is a potent theme in talking to the young. By the time the trail and the hardships in the South have ground them down, they go on automatically. Each successive disillusionment alienates them further from the cause, but these doubts cannot be expressed to anyone, and with all the suffering and blood spilled for the cause, it is difficult for an NVA member to rationalize himself into defection.

A powerful cohesive element is the three-man cell system present throughout the NVA, by which political and disciplinary control is maintained. Though detested as a device to prove the cadre right most of the time, it serves the function of letting off steam, improving survival chances in combat, and responding to emotional needs as a kind of family substitute. But just as in the family group in a totalitarian state, innermost thoughts are kept to oneself.

Conclusion

While vulnerabilities among the NVA in South Viet Nam appear to be on the increase, units continue to show a remarkable degree of cohesion, largely due to the psychological controls and continuous group therapy (cell system, self-criticism sessions) to which they are exposed. However, according to the available evidence, NVA units and individual infiltrators are now younger and less conditioned than ever before. The effects of war weariness, disenchantment, and the nagging deprivations on these less seasoned troops should serve to make them a more promising PSYOP target than in the past.

GUIDANCE

In devising a PSYOP program aimed at NVA units and individual NVA infiltrators, both the elements of cohesion and the psychological vulnerabilities of the target audience will have to be taken into account. Whittling away at the indoctrinated response might be less productive in the short run than exploiting obvious vulnerabilities, but in the long run a weakening of the soldiers' psychological defenses, laboriously built by the cadre, may cause their entire world view to crumble. At any rate our approach should be in tandem. We deal here with the cohesive elements first, as they are harder to tackle.

Attacking Elements of Cohesion

The endless repetitions of communist themes of colonial oppression, liberation and revolutionary duty must be countered by patient, reasoned, and repetitive efforts to explain American policies and intentions in Vietnam simply and convincingly. That we seek no colonial status, no bases or special privileges, that we have solemnly stated we will withdraw when the Vietnamese people themselves have had a chance

to decide their own future without foreign pressure or interference, that the people of South Viet Nam need no liberation, that they are already free, with institutions chosen by majority rule, these are the points that need to be made continuously and persuasively.

The myth of cadre and party infallibility must be attacked over and over again by contrasting word with deed or fact. We must ask insistently whether the NVA soldier knows the real purpose of the three-man cell and the constant self-criticism sessions, namely to make him into a tool of his leaders and trick him into casting aside those doubts and hopes that do not correspond with the aims of the party. We must reassure him that his doubts and hopes are right that they are shared secretly by a majority of his comrades and openly by most of the world, and that the goals of the party are wrong, disruptive of harmony, destructive of family life, cruel, unjust, and therefore doomed to failure.

We must counter the mental conditioning against surrender or defection as a dishonorable act and the concomitant fear of mistreatment at GVN/U.S. hands, which have been drilled into NVA troops by their cadre. To do this effectively, we must provide potential ralliers both with a framework of sound rationalizations and detailed instructions on giving up the fight. We must persuade the NVA soldier that to surrender or rally will be neither dishonorable nor personally detrimental to him, on the contrary, that ending the bloodshed and suffering both individually and collectively, can only benefit the Vietnamese people.

Attacking Vulnerabilities

. . . . The vulnerabilities to be exploited are covered in some detail by the individual themes given below. In general they include separation from families, lack of mail, the daily hardships and risks which are particularly harsh on the unseasoned young troops now being brought into battle, poor or nonexistent medical care, and the wide contrasts between what they are taught to believe by the cadre and what they experience or see for themselves.

Now that there are indications that soldiers with relatives in the South are beginning to appear among the infiltrators, our range of PSYOP appeals should include some messages assuring reunion with these family members. A concerted effort should be made to identify NVA Hoi Chanh with relatives in the South and to obtain family reunion photos for use with these leaflets.

Different approaches should be used for PSYOP messages along the infiltration route and those to NVA units within the RVN. Trail leaflets might suggest ways to avoid service such as symptoms of grave sickness, straggling and desertion while still in North Vietnam.

THEMES

Attacking Vulnerabilities

Sympathize with the NVA soldier on the hardships he must undergo in

the South, give him credit for his courage and steadfastness, but prove to him that he has been misled, that the cause for which he is fighting is not just and not deserving the sacrifice of his young manhood. Couple with Chieu Hoi message.

* * * * *

Illustrate that NVA forces in the RVN face a formidable Republic of Vietnam Air Force (RVNAF) defense force, highly motivated because they are not attacking anyone else's territory but defending their own, equipped with the most modern weapons, aided by the most powerful nation in the world in an unbeatable combination. To avoid the death or mutilation which will become inevitable the longer he remains with the NVA or VC, offer the NVA soldier the advantages of the Chieu Hoi program.

* * * * *

Convey as often and as persuasively as possible the story of defeats suffered by NVA units in South Vietnam. Give credible details of these defeats and ask the recipient of the leaflet to reflect on his own whether or not the cadre are lying to him. Again, couple with surrender or Chieu Hoi appeals.

In case NVA soldiers do not have the opportunity to surrender or rally in the heat of battle, suggest that they permit themselves to be captured and provide full information on the treatment of prisoners of war by the GVN, including scrupulous observance of the Geneva Convention, ample food and medical care, educational and sports programs, mail privileges, Red Cross inspections and gifts, and eventual repatriation.

Remind NVA soldiers that they are wasting the best years of their lives away from families and friends in North Vietnam. Recall that the first NVA infiltrators were told in 1963 that South Vietnam would be "liberated" in that year. Pose the question of whether their sacrifice is justified and offer the Chieu Hoi program as an alternative.

* * * * *

Sympathize with the NVA soldiers' lack of working mail communication with their close families back home. Pose the question of whether the cadres do not want to keep them isolated from the world in order to shut out all unfavorable news and control them even more completely. Talk knowledgeably about their worry concerning the safety of relatives in the north, reiterate that only military targets are bombed by U.S. planes to make NVN stop its invasion of the South, but that the U.S. is cognizant that civilians living or working near military objectives may inadvertently suffer. State that their decision to rally or to get captured is an honorable way to shorten this bloody internecine war.

* * * * *

.... During future Tet seasons, utilize photos of ex-NVA soldiers enjoying life with a family in the South, grouped around a festive Tet table. Point up the complete disregard of the NVA/VC for Tet and its meaning as seen in the treacherous 1968 Tet offensive. The special family significance of Tet continues to have a hold on the emotions of NVA

members, and its celebration in the free South should be stressed. Offer the Chieu Hoi program as their way to a brighter future.

Attacking the Indoctrinated Response

The entire mental conditioning of NVA troops, pursued through political indoctrination sessions, the three-man cell system, and constant exhortation by the cadre, aims at achieving automatic responses reflecting the communist party view of world issues. This rote learning becomes a powerful cohesive element. It can be chipped at only by repeated discoveries that what has been studied and accepted as gospel truth does not accord with visible facts in the soldier's personal experience. We probably cannot hope to substitute printed arguments for personal experience, but can reinforce the secret doubts that may have been nagging typical target audience members.

We have to build confidence and reassure NVA soldiers that the secret doubts they have been harboring are correct and that they are secretly shared by their comrades. The three-man cell system is a cruel and dishonest game, we should tell them, to have them suppress legitimate doubts and make them putty in the hands of the cadre. Again, the Chieu Hoi program is a way to reassert that they are human beings instead of machines without a will of their own.

The themes of colonialism, U.S. aggression, SVN misery and exploitation, the hireling nature of the GVN, are the kinds that are drilled daily into NVA troops to trigger parrot responses and automatic rejection of contrary evidence. Our messages must whittle away at each of these themes.

We need to remind the NVA soldier continuously that although he is being told he is in South Vietnam to "liberate" his southern compatriots, the people do not need or want the kind of liberation he is ordered to bring them. He should be aware that he is rejected by the people whom he is sent to "liberate."

PSYOP messages should stress that the United States is not in South Vietnam for a colonialist purpose, but only to help the elected government to defend itself against aggression and the imposition of a communist system rejected by the majority. The United States is in Vietnam at the invitation of the GVN. It will leave when the GVN no longer requires U.S. assistance to defend itself and requests the departure of U.S. troops. United States leaders have stated America's intention to withdraw as soon as practicable after a settlement is reached with Hanoi.

The GVN and the United States have tried every possible way to get Hanoi to the conference table, but Ho Chi Minh and his government have not responded.

RVN prosperity and the development of representative institutions which give every man an opportunity to work, learn, and earn according to his free will and his personal ability instead of forever being told what to do, should be emphasized over and over again with photo illustrations where appropriate.

Repetitive use of messages showing plenty of consumer goods in the hands of the RVN people, such as private vehicles and appliances, plentiful food, entertainment and educational opportunities instead of the deprivation and drastic controls that are the rule in North Vietnam, should raise the question of which system performs better for the people.

Examples of the SVN National Assembly taking independent steps, reprimanding the government, or causing changes in government plans can be used to drive home odious comparisons with the totalitarian institutions of North Vietnam. Again, we should ask and answer: which regime serves the people better?

TRANSLATION PROBLEMS*

BY RICHARD H. ORTH

Although bilingual interactions will often escape precisely accurate translation, there are a number of steps the psyoperator can undertake to overcome or minimize this problem.

When the population studied speaks a foreign language, the problems of translation have to be faced. While it will not always be possible to obtain perfect translations, the PSYOP officer should strive to reach a reasonable approximation and to avoid known pitfalls. In some cases, the PSYOP officer may be fluent in the foreign language. In many instances he will have to rely on other U.S. Army or indigenous personnel who speak the local language or dialect. Some of the problems involved in translation and some solutions that have been developed by various researchers are considered below.

Problems of word meaning. In translations one seeks to get across the identical meaning from one language into another. There are several hurdles to the accomplishment of this end. A word may have two or more meanings. A word's meaning is affected and may be altered by the context. Words may carry the general meaning but differ in intensity—for example, "very good," "excellent," "outstanding." A word or statement carries with it a certain feeling tone and implied values and assumptions of which an outsider may not be aware.

Possible solutions to problems of word meaning. To counteract the above problems, the following methods have been developed on the basis of field experience. Two or more persons translate an item independently of each other so that any discrepancies can be checked and resolved.¹ "Back translations" are made. This means that in addition to the original translation from English into a foreign language, a retranslation is made by another person or persons into English. The original text and the "back translated" text should be practically identical in meaning. Any differences should then be resolved.² Translators should be especially sensitive to the intensity of a word. If time is available the translated wording can be tried out on some foreign nationals, and the interviewer may question them to see whether intended meanings come across. When

*Original essay by Richard H. Orth.

words and statements imply more than the direct literal translation, these implications must be spelled out.³

Problems of spoken versus written language. In every language, there are differences between the spoken and the written language. Such differences may reflect distinct functions; for example, the formal literary language may be used in legal and governmental relations, while the villagers discuss their problems among themselves in the vernacular or a dialect. Social class factors may be involved in the choice of words. Terms appropriate for legal matters may be quite unsuitable for a frank and unrestrained interview. In addition, certain items may be incomprehensible to local people. Although a word is listed in the dictionary, it may not be familiar to the rural dwellers. Such abstract concepts as "prestige," "problem," and "loyalty" may be meaningless to many rural people.⁴

Possible solutions to problems of spoken versus written language. To overcome the above difficulties, some solutions have been offered in social science literature. The use of persons familiar with the language or dialect is recommended. A try-out of the items is indicated with some persons who are as familiar as possible with the local language usage. In general, it would be well to keep in mind that rural people usually are not too familiar with the literary language. Therefore, it would be a good rule of thumb to use simple words and sentences in the translated text. Another practical solution is to use an illiterate translator immersed in the local culture who translates to a literate translator who in turn can write down the translation.⁵ When unfamiliar concepts, for example, "prestige" or "loyalty" are to be translated, one may find a simpler synonym or define the term in simpler words.⁶

Problems of social context. The meaning of a word is affected not only by its place within a sentence or statement but also by the social and situational context in which it is spoken.

Possible solutions to problems of social context. To overcome these problems, it is advisable where possible to use personnel who have bicultural experience and can perceive the effects of the situation and the cultural setting of the words.⁷

Problems due to interviewers. Interviewers may influence the responses to a questionnaire or interview not only by their use of language but also by their personal effect on the respondent. For example, when city students from the capital are used to interview rural people, they may evoke a negative or suspicious set among the latter.

Possible solutions to problems due to interviewers. It has been proposed to have a native interviewer, even if he is illiterate, pose the questions and have the outside researcher (for example, a student) write down the responses. Another possibility is to give a tape recorder to an illiterate local interviewer.

The quality of translations is limited by time, personnel, and budget. One cannot be certain of achieving ideal translations. One can, however, strive for a reasonable approximation of meaning by using the above suggestions within the given limitations.

When the respondents speak another language, the questions have to be translated. Translations should carry the precise meaning, yet often there is no one-to-one relationship of words in two languages. While the PSYOP officer may not find ideal conditions to solve these problems, a number of suggestions are offered to obtain reasonably accurate translations.

TET IN VIET-NAM*

BY CHUONG DAC LONG

Time is an important determinant in the receptivity of audiences to media as well as to messages. Analyses such as this one facilitate message composition and media selection.

The custom of celebrating Tet goes back to remote antiquity. Like many other Vietnamese traditions it was imported from China. . . . One of the best preserved rites of Tet is the celebration of the feast of the Jinni of the Home, on the 23rd day of the 12th month. This feast gradually lost its original meaning, even in China, and when it was imported into Viet-Nam, it underwent a profound change in the minds of the people and became simply a sentimental story.

The same may be said of nearly all the customs concerning Tet: originally they were imbued with lofty and precise philosophical significance, although usually disguised under a poetic parable. The incomprehension of later ages brought about profound transformation and alteration, and the customs became largely folk beliefs. They should be examined in this light, rather than rejected outright as beliefs of no value, unworthy of consideration. Nothing is more moving to Vietnamese than the permanence of these rites, they are like messages addressed to us by our ancestors from the distances of time.

*Excerpts from JUSPAO Field Memorandum, Number 31, November 28, 1966. JUSPAO Planning Office, Saigon.

One of the most characteristic customs of Tet consists in buying a flowering peach-tree branch that is placed in a vase for the duration of Tet. . . . Many people imagine that these branches have no other purpose than to add a graceful decoration to Vietnamese homes, and today, in fact, they have no other significance. Originally, however, they had the same effect as the *cay-neu* (a tall decorated pole erected before the house during Tet) and were used like them, to protect oneself from the visit of demons.

. . . According to the Chinese astrological calendar, time is circumscribed in revolutions of 60 years, divided into cycles of 12 years, each cycle containing 12 months, and the like. Years and months thus have the same names: there is the year *thin* (Dragon), just as there is the month *thin*; the year *ty* (Serpent), the month *ty*, the day *ty*, the hour *ty*, and the like.

A cycle of twelve years is placed under the sign of twelve supernatural powers (*hanh-khien*), some of whom are well-disposed and others hard and cruel. On the last night of the year, this power passes to the new power. The passing of service that is known as *giao-thua*.

In town and countryside, the head of each family; each mayor (*ly-truong*), each mandarin governing a province, the Emperor in his capital and all the pagodas, would offer a token sacrifice at the same moment to thank the old power *hanh-khien* and to welcome the new. This ceremony of *giao-thua* is performed in homes at midnight, the moment when the hour of the Pig (*gio hoi*) changes to that of the Rat (*gio ty*). It is carried out with great solemnity. In the old days it used to be accompanied by noisy and interminable fireworks and the beating of drums. This has given rise to the expression "*Trong keu ran nhu trong giao-thua*" ("A rolling of drums comparable to those of the *giao-thua*").

It is the custom at *giao-thua* for everyone to stay awake till morning so as to be prepared to welcome in the New Year. It is often amusing to see parents, as soon as the drums of the pagoda announce the arrival of the New Year, rush to wake up all the sleepy children in the house, sitting them up by force if necessary and, in spite of their cries and grumblings, so they too will not tempt fate by failing to observe this custom.

It is strictly forbidden to sweep the house (*after giao-thua*) during the first day of the Tet. During the days that follow, sweeping is allowed but it is absolutely forbidden to gather up rubbish and throw it away.

. . . It is forbidden to touch a broom on this Tet day. Vietnamese children recite the following riddle: "*Trong nha co mot ba hay la liem*," which means: "What person in the house scrounges all she wants?" The answer, of course is "The broom," it picks things up wherever it passes. The origin of the prohibition on removing household refuse is found in another Chinese legend. . . .

. . . One of the customs concerning Tet has a curious resemblance to a practice taught by the Druids of ancient Gaul, who used to lead the people into the forest on the first day of the year seeking lucky branches of

mistletoe they would keep the following twelve months. The Chinese and Vietnamese are also expected to bring home from their first walk of the New Year a leafy branch, if possible covered with fruit and flowers (*canh-loc*). The heavier the branch, the greater will be the riches (*loc*) earned during the coming year. Today this belief has become a reason for people to go for walks in public gardens or the Vietnamese countryside.

... It is generally supposed that Tet in Viet-Nam begins on the first day of the first month of the lunar New Year. This is true in general, but there is an exception in certain provinces (Hadong, Son Tay and Thai Nguyen), where Tet is celebrated later, during the first month. This custom dates from the reign of the Emperor Tu-Duc and is thus 70 or 80 years old. We have heard of an explanation given by certain old men, survivors of this heroic period. Emperor Tu-Duc's reign was marked by numerous uprisings and especially by frequent raids by Chinese "black flag" pirates. These pirates knew that the Vietnamese, like the Chinese, were in the habit of holding sumptuous celebrations at Tet. This offered them a good occasion to loot, burn, rape and massacre the inhabitants of the coast. After several years of this treatment, the people got together and decided to adopt the practice of *Tet cung*, or "Delayed Tet." During the days when other Vietnamese were celebrating joyfully, these people would bury their valuables, leave their homes and hide in the woods and mountains. The arriving pirates, finding nothing of interest to them, would conclude that the region was so poor that its inhabitants could not even observe Tet. A few days later, the villagers would return and hold their feasts in peace, finding their pleasure even greater for the delay. They became so used to this "delayed Tet" that they continued the custom.

PSYOP Intelligence Sources

The sources of intelligence for psychological operations are several and varied. As Phillip Katz has indicated,¹ primary sources are (1) prisoners of war, (2) defectors and refugees, (3) the civilian population, and (4) broadcasts. Other sources, of different levels of importance, include (5) captured documents, (6) enemy propaganda, (7) intelligence reports, and (8) published and unpublished reports.

In this part of the chapter are articles dealing with or illustrating intelligence production from these sources. The methods used to derive useful information from the sources—to "exploit the sources"—are covered in the following subsection, "PSYOP Intelligence Methods."

The use of prisoners of war or defectors as intelligence resources hardly requires comment here. This practice is almost as old as the concept of warfare. Refined psychological techniques for extracting information from prisoners of war have been available for a number of years and are applied with varying degrees of success by all elements of the armed forces. Treatment of defectors does not generally pose the information extraction problems encountered when handling POWs. However the problem of overstatement or understatement by the defec-

tor, for the explicit purpose of telling his new-found friends what he thinks they might want to hear, cannot be discounted.

Civilians—friendly, hostile, or neutral—are an important potential source of PSYOP intelligence, particularly when, as in insurgency situations, the civilian population may be the only group in constant contact with the insurgents on other than military terms. Interviewing and sampling, two major approaches to intelligence collection from the civilian populace, are discussed in the section of this chapter dealing with “PSYOP Intelligence Methods.” Similarly, travellers from among the target audience can be an important source of information on audience attitudes (though the representativeness of their views may be suspect) as well as on socioeconomic and political intelligence.²

Radio broadcasts within target areas are also a primary source of information. Monitoring such broadcasts—a newer source than those time-honored ones, such as prisoners of war and refugees—provides not only timely intelligence, but supplements, as well, the surveying of local newspapers, periodicals, and books to provide a good idea of the information locally available which helps shape the opinions of the audience.

Documents are sometimes narrowly defined as captured enemy secrets. This definition is far too narrow for intelligence purposes. Documents also include enemy-issued, or enemy-sponsored, public media pronouncements and communications to other governments. With respect to U.S. psychological operations, the amount of relevant information available from this source has often been overwhelmingly large, and therefore somewhat misused or unused. Advances in information storage and retrieval, as well as in content analysis, suggest that captured documents and public utterances of an enemy regime will be far more useful intelligence resources in future PSYOP campaign planning.

The use of original documentation as an intelligence assimilation method is historically one of the most successful techniques. It involves the careful analysis of written and verbal enemy messages. Capture of documents provides an analysis source that is usually too large in volume to process well. Major problems involve screening captured documents to select those which have the highest potential impact, reliability, and accuracy³ and correlating analyses which might be based upon different and conflicting documents.

Propaganda can often appear in the form of enemy documents. In other cases, however, propaganda may take the form of rumors or other communications. (See Chapter VIII.) Enemy propaganda is one of the most fertile fields for PSYOP intelligence.⁴

Additional data for the psyoperator are contained in intelligence reports produced by U.S. or friendly intelligence agencies. These are secondary resource materials (that is, they are derived from other sources, covert or overt).

Other published and unpublished studies, reports, and documents are the last major source of intelligence. These include reporting in news-

papers, periodicals, and other media; books; theses; government or private studies or internal documents; and research findings. Like intelligence reports, these sources are usually secondary in nature (though they may incorporate primary research materials), and, again like intelligence documents, this may or may not include analysis. Inclusion of analytical comment in source material can be dangerous, since the analyses may be (1) directed toward an objective dissimilar from the one for which the document is later utilized, (2) outdated, or (3) inadequate as a result of time constraints exercised on the production of the document for its original purposes.

Sources of PSYOP intelligence often present one or two opposite problems: inadequacy or superfluity. The psyoperator may find that not enough of his material is relevant, that it is outdated, or that there is simply not enough for his needs. On the other hand, there may be so much relevant intelligence data that his primary problem is in ordering and analyzing the data in the time allowed. In either case, the information that he decides to use must be analyzed. The methodologies open to the psyoperator for analysis of his intelligence data are discussed in the following section.

Prisoners of War

PW AND CAPTURED DOCUMENT DOCTRINE*

BY JOHN A. HEMPHILL

Newly captured prisoners of war and documents are important sources of information. To maximize usefulness, particularly in stability operations, interrogation and document translation should begin as soon as possible after capture.

The problem of what to do with prisoners of war (PW's) has perplexed military commanders from the beginning of recorded history. . . . In modern times, steps have been taken to eliminate brutality and to standardize PW treatment. However, one part of the PW subject has not changed over the centuries—the PW continues to be a valuable source of information and an important link in the production of intelligence.

*Excerpts from "PW and Captured Document Doctrine," *Military Review*, XLIV, no. 11 (November 1969), pp. 65-71.

For the modern U.S. Army, operations such as in Vietnam are a new experience. In contrast to the two World Wars and the Korean Conflict, there are no frontlines, no adjacent friendly divisions, and no rear areas containing an echelon of higher headquarters. Instead, there is a fluid battlefield with an elusive enemy. The command and control pattern has changed with brigade command posts usually located at such a distance from division headquarters that the brigades conduct virtually independent operations.

The subordinate battalions of the brigade, often widely separated, conduct small-unit operations to find the insurgent forces. When a significant insurgent force has been located, the brigade, and its battalions build up firepower and conduct a coordinated operation. However, these operations are generally brigade controlled and not the multiple-division coordinated operations envisioned for higher intensity warfare.

Operating on a fluid battlefield, the brigade and battalion commanders require fresh information to keep pace with the fast tempo of operations. Newly captured PW's and documents are important sources of this information as they have been in past conflicts. But the commander must have the capability to obtain this information before its timeliness is lost. This capability should be provided for in U.S. Army doctrine.

ADEQUATE DOCTRINE?

Doctrine contains the fundamental principles guiding military actions. These principles provide the guidelines for organization and equipment that determine capability and operational procedure. U.S. Army doctrine for brigade and battalion PW and captured document operations was conceived for general and limited war. Is the doctrine adequate for stability operations?

The characteristics of internal defense have changed the military operational pattern. In general and limited war, the military forces create their own operational environment. Both sides have established frontlines and rear areas. Progress is marked by the capture of key terrain features which usually results in the tactical defeat or destruction of the defending enemy forces. The brigade and battalion commanders plan their operations based upon terrain-oriented objectives and intelligence of the defending enemy. If the enemy gives up the objective without a fight, this is a "plus" and generally accelerates the operation. But the characteristics of stability operations are different.

In stability operations, there are no well-defined frontlines and rear areas. All areas are an actual or potential battleground. The objectives are the insurgent's forces, underground infrastructure, logistic support system, and support by the population. From the brigade and battalion point of view, the predominant differences from general and limited war are the fluidity of the battlefield and the difficulty in fixing the location of the insurgent forces.

In over-all terms, the insurgent is generally the weaker military force. He cannot afford a major battle with stability forces until he gains a preponderance of strength. The insurgent must use mobility, clandestine locations, and advantageous terrain to offset the stability force's superiority. His is a war of continuous movement dictated by the capability of the terrain and population to shield his location. To prevent annihilation, the insurgent must retain the capability to strike and then withdraw before his initiative is lost or the stability forces can employ their superior firepower against him.

DIFFERENT PROBLEM

The stability force commanders have a different problem. They must find the insurgent and maintain contact until their superior firepower can be built up and employed. In a war with frontlines, enemy withdrawal is a battlefield victory. In stability operations, the withdrawal is the insurgent's way of changing the location of the conflict to another area where he will have the advantage.

In stability operations, the brigade and battalion commanders do not achieve success by taking a terrain objective or forcing an adversary to retreat. Success is gained only through the complete destruction of the insurgent force. To destroy the quarry, contact must be maintained with an effective pursuit. However, the insurgent has a variety of options to conduct his withdrawal. To counter, the stability force commander needs immediate, up-to-date information on the enemy's plans and strength. The brigade and battalion commanders cannot wait the time required for higher headquarters to develop intelligence for their next operational phase. The information is needed immediately if relentless pursuit is to be initiated without hesitation.

EVALUATE SOURCES

Captured insurgents, refugees, and defectors are firsthand, last-minute observers of the adversary's operations and plans. Also, documents and personal letters often are a valuable source of recent information. However, capture is not enough. The brigade and battalion commanders must have the available capability to screen, interrogate, translate, and evaluate their sources immediately after capture in order to obtain timely information. An hour's delay, especially when operating in difficult terrain or under the cover of darkness, is often enough time for the insurgent to slip away.

In Vietnam, it [was] not uncommon for a unit to spend over 90 percent of operational time searching for, and less than 10 percent fighting, the insurgents. Most contacts [were] broken by the insurgents under the cover of darkness. Prisoners and documents are of limited immediate value to the battalion commander who does not have the organic or attached capability to interrogate or translate thoroughly.

The U.S. Army's doctrine sets the guidelines for a commander's operational procedures and outlines his operational capability. This does not imply that the commander cannot use initiative and ingenuity, but doctrine places a limit on these attributes. To be effective, doctrine must conform and change with the operational environment.

U.S. Army doctrine concerning PW's is based upon the Geneva Convention Relative to the Treatment of Prisoners of War, 12 August 1949 (GPW) which prescribes the humane treatment of captives.

* * * * *

When U.S. military combat units were introduced into Vietnam in 1965, the U.S. command in Saigon announced that its soldiers would follow the GPW in the treatment of captives. This establishes the precedent for U.S. Army PW doctrine for stability operations to be based upon the GPW's principles.¹

OBJECTIVES AND PRINCIPLES

The objectives and principles of current U.S. Army PW doctrine are concerned with assisting friendly operations within the limits implied by the laws of land warfare to include the GPW. These objectives and principles set the goals and parameters for PW operations and guide the development of doctrine. These objectives are:

- Acquisition of maximum intelligence information within restrictions imposed by the law of land warfare.
- Prevention of escape and liberation.
- Promotion, through example, of proper treatment of U.S. personnel captured by the enemy.
- Weakening the will of the enemy to resist capture.
- Maximum use of PW's and civilian internees as a source of labor.

The principles are:

- Humane treatment.
- Prompt evacuation from the combat zone.
- Provisions of opportunity for prisoner interrogation.
- Instruction of troops in the provisions of international agreements and regulations relating to PW's and civilian internees.
- Integration of the procedures for evacuation, control, and administration of PW's and civilian internees with other combat service support operations.

With the exception of objectives regarding use of PW's as labor, these objectives and principles apply to the brigade and subordinate units. For brigade and battalion stability operations, there are contradictions between the second and third principles. The principle of providing for PW interrogation is primarily aimed at division and above. However, it does have applications to PW evacuation and control at all levels. In general, the objectives and principles are satisfactory for internal defense situations, but not all current U.S. Army PW doctrine developed within these guidelines is adequate for brigade and subordinate unit-level stability operations.

Prisoners are usually captured by the battalion's frontline troops. The doctrinal guidance to the capturing forces is to disarm and then to perform the five "S's"—search, silence, segregate, safeguard, and secure. During the search phase, the PW's and documents are tagged with a card giving pertinent facts concerning the capture. The documents are forwarded to the battalion intelligence officer (S2) and the prisoners are evacuated to the battalion PW collection point.

This doctrinal guidance is sound and simple to follow. Emphasis is placed upon preventing escape and evacuation to a place of less danger for interrogation. However, because of the quick evacuation and lack of interrogation capability, the company commander does not obtain the needed timely information.

INTELLIGENCE SUPPORT

The company commander does not have an organic intelligence support capability, but the battalion has this capability in the intelligence officer and intelligence sergeant. The primary function of both is to advise the battalion and subordinate commanders on enemy intelligence and information, but neither is required to have the capability to interrogate PW's or to translate documents. This requires special qualifications—interrogator and interpreter—that are not organic to the combat battalion. The emphasis is to evacuate PW's and documents as quickly as possible to brigade and division for interrogation or translation. The principal tactical interrogation of PW's and evaluation of documents take place at division level.

The field army, or equivalent level headquarters, military intelligence (MI) battalion provides each division with an MI detachment. This detachment has the mission of providing specialized intelligence and counterintelligence functions which require special skills in the utilization of foreign languages.

The detachment includes an interrogation prisoner of war (IPW) section with interrogation and document translation capability. Although division is the tactical focal point for PW operations, the normal procedure is to attach IPW teams to committed brigades. This provides the capability to conduct formal interrogations and to scan documents for tactical information. The IPW teams are a valuable asset to the brigade commander and his staff.

Depending upon the number of interpreters, the IPW team usually consists of approximately four to eight people. The number of personnel limits the team's ability to screen and determine accurately the true intelligence value of each PW and document. The thorough analysis must be left to higher echelon where time is lost in transit, processing, and dissemination of the gained intelligence. When this intelligence arrives at the brigade and battalion level, it has become history and is of little [tactical] value.

SPECIALIZED OPERATIONS

U.S. Army doctrine envisions the temporary attachment of IPW personnel below the brigade level for specialized operations. But this is not encouraged. Also, the battalion commander may request brigade IPW teams to come forward to interrogate selected PW's before being evacuated from the battalion operational area. This has advantages in that the brigade interrogators should be familiar with the battalion's operation, and the PW's information should be up to date.

If IPW support cannot be obtained, the doctrinal guidance is for battalion and subordinate commanders to rely on assigned noninterrogator personnel who have a language capability and some interrogator experience. There is unlikely to be any personnel in a combat battalion with a significant interrogator or indigenous language capability. When required, battalion and lower units probably will be provided an interpreter. This appears to be a satisfactory solution, but much depends upon the capability of each individual interpreter. Logically, the better trained and more capable interpreters will be placed in higher priority assignments than with a combat battalion.

Interrogation is an art requiring special training in questioning and examining an individual. To be most effective, the interrogation of a PW should begin as soon as possible after capture. Being captured, even voluntarily, is a harrowing experience. At this time, the PW can be expected to talk more freely and to lack the ability to remember security lessons. To exploit this vulnerability, the interrogator should begin his examination with minimum delay.

PW interrogation and document translation immediately after capture would enhance the brigade and battalion capabilities to conduct a rapid pursuit and other operations with the least possible hesitation. To eliminate delay in obtaining this enemy information, the battalion and the brigade commander require an adequate IPW capability that will meet their stability operations requirements.

The U.S. Army's doctrinal principle of prompt evacuation from the combat zone states:

Prisoners of war shall be evacuated, as soon as possible after their capture, to camps situated in an area far enough from the combat zone for them to be out of danger. . . . Prisoners of war shall not be unnecessarily exposed to danger while awaiting evacuation from a fighting zone.²

Any point is a likely point of insurgent attack to include PW collecting points, higher headquarters, and PW compound locations. The GPW principles must be followed, but should be interpreted in accordance with the type conflict involved. GPW does not prohibit retaining a PW at brigade, battalion, or lower level for interrogation unless the PW would be subjected to danger from known or suspected combat. Unless there is continuous fighting, the point of conflict in a stability operation is difficult to predict. The brigade and battalions should not maintain PW compounds or hold documents for excessive periods. Both should be

evacuated to higher headquarters as soon as the command's tactical requirements are fulfilled.

In reevaluation of current doctrine, the emphasis must be placed upon the characteristics of internal defense conflicts and operational requirements of stability forces. The key to success in brigade and battalion stability operations is the capability to destroy the insurgents. This capability would be greatly enhanced with a PW and captured document doctrine conceived in context with the distinctive characteristics of internal defense stability operations.

NOTES

¹ The United States, the Republic of Vietnam, and North Vietnam have ratified the GPW. Both the United States and the Republic of Vietnam are following the agreement's provisions while North Vietnam and the Viet Cong have refused to apply the GPW. The Vietnamese Communists have taken the position that they are not a signatory to the convention. North Vietnam contends that U.S. pilots captured in their territory are criminals and subject to North Vietnamese laws.

Defectors

A NORTH KOREAN DEFECTOR*

By the 7TH PSYOP GROUP

Defectors, agents, and prisoners of war can be a useful source of PSYOP intelligence. In this essay the defector provided information which could help (1) enhance communicator credibility, (2) lead to recommendations for operational changes to increase effectiveness, and (3) update available target group information.

The source was a male, who graduated from a North Korean agricultural college, was a former member of a North Korean economic planning unit, came to the Republic of Korea in July 1969.

PSYOP TARGET GROUPS IN NORTH KOREA

Based upon his knowledge of conditions and of categories of people in North Korea, he suggested the following as suitable target groups for PSYOP directed against North Korea:

1. Workers in factories, enterprises, mines.
2. Farmers
3. Students
4. Intellectuals
5. Government office workers
6. Full-time Party office workers
7. Military personnel

*From "PSYOP Intelligence Notes," Nos. 249, 254, 253, 252, 255, the 7th PSYOP Group, 5-13, April 1971.

8. Office workers at factories and enterprises
9. Fishermen
10. Agent trainees
11. Repatriates from Japan

Workers in Factories-Enterprises-Mines

According to the source, North Korea defines workers as people who engage in work in the industrial field and who receive wages based on this manual or physical effort. Also classified in this group are farm workers (*nongup rodongja*) who are employed at state-run farms and receive wages rather than work points, as do farmers on cooperative farms. In North Korea, "workers" are treated as a basic class and a nucleus of the state because they are responsible for production.

Workers and their families can be classified according to their backgrounds into these groups: (1) those who have worked in factories and mines during and since the Japanese occupation; (2) those who were former landlords and capitalists during the Japanese occupation and became workers after it; (3) those who were formerly middle and small businessmen; (4) those who had family members who had defected to the ROK since the liberation from the Japanese; (5) those who had supported UN Forces during the Korean War; (6) those who had been purged from high official North Korean posts on charges of anti-Party activities or factionalism; (7) repatriates from Japan; (8) those formerly engaged in low-level labor such as A-frame porters and peddlers.

North Korean authorities claim in indoctrination programs that workers are the basic class. When this is closely examined, it is seen that workers are composed of people with a wide variety of family backgrounds (*songbun*). The source said that while workers can be termed a key production group, they can by no means be designated as a political unit. Except for those who were workers during and since the Japanese occupation, workers in the other categories listed above are distrusted politically by North Korean authorities. All of these groups of workers have grievances against the North Korean Government because they know that they and their children will not make any progress where they work or in North Korean society. People who were workers under the Japanese occupation can get and hold positions at all levels and can certainly be, at least, work team chiefs who may not be engaged in direct manual or physical work. Members of the other groups can never become work team chiefs. Workers aspire to progress and become work team chiefs, management workers, or office workers, but only those workers in the first group, those who have worked in factories and mines during and since the Japanese occupation, have the possibility of achieving their aspirations. Workers in the other groups cannot progress to such positions even though educated and qualified for them. The reason is political distrust because of the family background of all the groups except those who were workers during and since the Japanese occupation. The source

estimated that no more than one out of every four workers had a favorable family background because of having been a worker during and since the Japanese occupation. Consequently, the chance to improve their position is denied to the majority of North Korean workers. Educated and qualified workers who might otherwise progress see less well-qualified workers with good family backgrounds rise to positions above them. This has been a continuing source of resentment.

Farmers

The source separated farmers in North Korea into four categories according to backgrounds: (1) farmers now farming and whose families have been farmers for generations; (2) farmers and their families and people who have been sent by the North Korean regime to work on farms because of unfavorable family backgrounds, especially people who had made false statements or entries during family background investigations; (3) former urban dwellers and their families who committed political errors, engaged in anti-Party activities and factionalism, and who have been purged and punished by being sent to work as farmers; (4) people and their families who engaged in business during or after the Japanese occupation.

According to source, North Korean farmers, like those in the ROK, tend to be conservative and believe in the maintenance of traditional Korean cultural practices. They also have a strong desire for private ownership.

In the North Korean farming population women outnumber men. The reasons are: (1) during the Korean War many men were killed, leaving their widows on the farms; (2) for a while after the Korean War, men moved from the rural areas to cities to work in factories; (3) there was a tendency after the Korean War for men who had been discharged from the North Korean Army to go to jobs in factories; (4) there was a past pattern for students from rural areas on graduation to move to jobs in urban areas. At present, North Korea prevents the movement of people, especially males, from rural areas to the cities.

Farmers, particularly the young, would like, if they could, to go to cities as factory workers. Most girls in farming areas aspire to be urban dwellers so that they can escape living and working on farms. Some people would like to move to other farming areas where the land is more fertile so they can increase their incomes.

Older farmers would like to operate their own farms as they once did. They want to cultivate land and live on it as they did for generations—working hard on the land during the farming season, but relaxing, eating, drinking, and visiting during the farming off-season—in other words, to follow the traditional living pattern of Korean farmers.

Older farmers wish for return to the pattern of genial farm life, but former patterns are now extinct on North Korean farms. Now farmers in North Korea must work during the winter; formerly they had been able

to relax and engage in a variety of other activities. They are not allowed any freedom to travel or to visit friends and relatives now. If a factory worker misses a day's work for sickness or other valid reason, he receives 60 percent of his day's wage; but if a farmer misses a day's work, even for a valid reason, he receives no work points at all.

People who were sent from urban areas to work on farms are particularly suspect politically. Farmers, in general, believe that they are subject to political indifference by the Government. The source said he heard that in 1965 Kim Il-song said, after he visited a rural area, that there seemed to be no key people in farming areas who could lead farmers politically. The reason he was reported to have said this was that the farmers in the area visited by Kim Il-song had generally poor political backgrounds. The children of farmers with good political backgrounds and who had the talent and training had left the farms for work in urban areas. These children were later reported to have been recalled to their home farming areas.

The source said that the North Korean Government now had a policy of retaining people in rural areas, especially those with good political backgrounds and training. Authorities cut back the number of technical school graduates allowed to go on to senior technical schools. Instead of going on to more advanced education, technical school graduates were sent to work in rural areas.

Students

The source divided students into two categories: (1) those receiving nine years of compulsory education, and (2) those receiving higher education, including senior technical school and college. The source's remarks pertain to the second group of students.

The common grievance of students is that job assignments after graduation are influenced more by family background (*songbun*) than by academic record. There are no competitive tests for jobs as in the ROK. Students graduate and are then assigned jobs. Political activity by students while at school is also a factor in future job assignments.

Students worry not about whether or not they will get a job, but rather about the type of job they will get. A person with a good family background will receive a good job; a student with a politically unfavorable family background, even though he has a good academic record, will receive a less attractive job, and perhaps in a remote area. Of course, to enter college a student must have a good family background, but even among good family backgrounds there are many gradations which influence a student's future in the North Korean social system.

The source remembered the case of an honor student at Kim Il-song University who had majored in languages and literature, but the student's father, the source believed, had been a refugee to the ROK during the Korean War. For this reason, the honor student was assigned as an ordinary worker in a construction materials factory in a rural area.

Source learned about this one day in Dec. 1967 when he went to visit his wife's parents and heard it from a former student who was there with the source's brother-in-law. The source asked him why he had a bandage on his hand, and the former honor student told his story. He had the bandage on his hand because of injuries caused by manual labor at his job. The onetime student was very dissatisfied with what had happened to him.

Students were also dissatisfied with the frequent and excessive compulsory social labor they had to do while attending school. In principle, college students had to engage in compulsory social labor for 30 days a year, divided into two 15-day periods, one during the rice-planting season and the other during the rice-harvesting season. In practice, however, students had to do more compulsory social labor at the rice-planting and rice-harvesting seasons than was specified. In addition, they had to spend a lot of time doing other forms of compulsory social labor throughout the year, both at school and elsewhere.

Students were dissatisfied with their overly organized and controlled life, which included compulsory attendance at many ideological indoctrination meetings, lectures, discussions, and rallies. Also, most college students had to live in dormitories at their school; there, life was strictly regulated.

College students were curious and interested in knowing what was happening in the world outside of North Korea, but under the North Korean system such information was not available.

Also, the source said that college students were romantic by nature, but the strict regulation of their lives and their education in required and ideological subjects prevented them from enjoying their youth, let alone experiencing the romantic aspects they hoped for.

Students during the compulsory nine years of education were still immature, accepting whatever was taught. They had not yet developed sufficiently and did not have enough experience to make significant complaints and adopt critical attitudes.

Intellectuals

The source separated intellectuals into two categories: old and young.

Old intellectuals

Old intellectuals (*nalgon inteli*) were those who received higher education during the Japanese occupation of Korea. Therefore, because most of these intellectuals had bourgeois parents, they were not considered by North Korean authorities as a key or basic class. They were targeted to be removed from their positions. In North Korea now, however, they are utilized as subjects for the North Korean program for reform of old intellectuals. Also, old intellectuals were the targets of ideological indoctrination activities under the slogan of revolutionization of intellectuals, which, according to the source, encompasses only old intellectuals. Gen-

erally, there has been a lot of unrest among intellectuals in their normal lives, and as a group they have been frustrated by the system. Accordingly, old intellectuals can be characterized by a passive attitude toward their jobs and activities and by a desire only to maintain the *status quo*. They are easygoing and do not seek any change in the system. They are "yes men" in responding to their supervisors. Most chief technicians at enterprises are old intellectuals. For example, a chief technician might develop a new idea and implement it. If he is successful, there is no problem. But if the idea is unsuccessful, he is severely criticized and held responsible for the failure. Authorities will criticize his failure by telling him that since he came from the old bourgeois class he was influenced by egoism and personal ambition. North Korean ideology says these qualities are commonly found in old intellectuals. Officials will also criticize the chief technician for wasting a lot of state property and materials. Therefore, knowing this will happen, most intellectuals adopt a passive attitude, lack enthusiasm, and try to maintain the *status quo* in their work. They are afraid to take chances and to dare to make improvements that might go awry.

A characteristic of old intellectuals who are writers is that their literary output is conservative and contains no innovations. Rather, they write with strict adherence to North Korean ideology, emphasizing class consciousness and Kim Il-song's teachings.

Source said that many old intellectuals, including artists, were purged after the Korean Labor Party's Congress in August 1956, when many politicians who were members of anti-Kim Il-song factions were also purged. At that time, North Korean authorities revealed to the North Korean people at meetings what anti-Party elements had done. Among these explanations, the source recalled one in the literary field in which a novel written by a purged writer was used as an example. The novel was about a mother whose only son joined the Army and went to a frontline unit. She worried very much about her son and prayed for his safety. The novelist stressed the mother's affection for her son. This was the main theme of the novel, but North Korean authorities criticized the book because of this theme and said the novel lacked class consciousness. Why should a mother in a socialist society worry about her son? Instead, said the official critics, the mother should have encouraged her son to join the glorious people's army to fight for the fatherland and the people. They also criticized the novel for developing people's hatred and pessimism toward war. They said the novel had no social value.

Old intellectuals are discontented because they are ignored, disregarded, and mistreated by Party workers who are even less educated themselves. Many old intellectuals are not satisfied with jobs they hold and therefore display little enthusiasm for the work. Because of this, old intellectuals are criticized and blamed for conservatism and for being indifferent to political activity.

Old intellectuals tend to be afraid of being replaced by young intellectuals, something happening gradually throughout North Korea.

Old intellectuals want the class policy (*gyekop chongchek*) of the North Korean Government to be ended. In North Korea, class is continually emphasized in all aspects of life, in propaganda, meetings, and indoctrination sessions. Old intellectuals want this ended along with restrictions on their advancement because of class and family background. They propose that people be allowed to progress in the society because of talent, performance, and ability.

Young Intellectuals

Young intellectuals (*jolmoon inteli*), as described by the source, are men and women educated in North Korea and in other Communist countries after the liberation of North Korea from Japanese occupation in 1945.

Young intellectuals, as are old intellectuals, are criticized for having a passive attitude toward their jobs. In North Korea, it is thought that in terms of technical knowledge, talent, and ability young intellectuals are inferior to old intellectuals. When young intellectuals are criticized for some error, they are also criticized for being inferior to old intellectuals and for the misuse of the Party and Government gift of an excellent education and much other assistance in their studies. Now, they have failed to pay back the Party and Government. Officials tell them that they are still inferior to old intellectuals despite what the Party and Government have done for them.

When young intellectuals who studied in other Communist countries are criticized for some error, officials contend that they have been influenced by "revisionism." There is a tendency for other intellectuals to envy young intellectuals who have had the opportunity to study abroad. Source said it was a common belief that young intellectuals who studied abroad were really not superior to those who had studied in North Korea. But young intellectuals who had studied abroad "put on airs" and considered themselves superior to those who had studied only in North Korea.

Old and young intellectuals, because of knowledge and educational background, had a keen perception of the realities of life in North Korea. They could see social, political, and economic contradictions and problems there. Because of this characteristic, they were apt to make accidental remarks in their normal conversation which revealed their inner awareness of problems in the system and to voice their complaints about it. The North Korean officialdom criticized them for this.

Government Office Workers

This group includes people who work in North Korean Government offices from the Cabinet down to the *ri* level. It does not include office workers in factories and enterprises or full-time workers in Party organizations.

North Korea builds up and reinforces the image of Government office workers as being the best qualified North Koreans because they work for the Government and as such as leaders of the masses. Because Government office workers are treated in such a way by North Korean authorities, they tend to become self-satisfied, and their perception and insight into the world around them are dulled.

The source emphasized that here lies the big difference in characteristics between Government office workers and intellectuals. Intellectuals are continually subjected to criticism, but their perception of reality is sharp. Government office workers are praised, but their perception of reality is blurred.

Government office workers, although they are praised as leaders of the masses, are continually assigned hard tasks and heavy workloads, and their pay in return is low—not much more than that of ordinary factory workers. Government office workers have to work long hours on their jobs and do not receive extra work allowances. But factory workers have rotating shifts and do get extra work allowances for high production.

Because of long hours and heavy workloads, many Government office workers suffer from poor health.

What Government office workers want is an opportunity for advancement and higher salaries. However, the criteria for promotion is based more on an employee's political activities than on his job performance.

Full-Time Party Office Workers

This group comprises Party members in full-time jobs in Party organizations from the Central Committee down to the *ri* level. Party office workers are considered key personnel and a nucleus in North Korean society. They are the most envied of all groups in North Korea. They enjoy more authority and influence than any other group in North Korean society and receive the best social treatment of all groups there. As a result, they are generally very enthusiastic about their work, apply themselves diligently, and have great personal dignity. Economically, however, they are not so well off as such occupational groups as factory workers, technicians, and engineers.

The source said that if Party office workers had grievances, they would be economic—that is, standard of living and salary.

Military Personnel

The source said that generally young officers and enlisted men, company grades and below, were influenced by and accepted what they were told in North Korean propaganda and indoctrination. For this reason, he believed they had no fear of war. They believe the propaganda that North Korean military forces are second to none. The source attributed this attitude to the fact the young officers and enlisted men had not actually experienced the horrors of war or of the Korean War. Also, they have no knowledge of the outside world. The actual strength and performance capabilities of military forces of other nations are unknown.

Yet young officers and enlisted men, according to the source, had a number of grievances because of their lives as soldiers. Promotions in the North Korean Army are slow because there is no war. Also, since members of this group are young, they are bored with the monotonous routine of military life; they want change, excitement. They have little opportunity to go on leave or to experience any North Korean life outside their confining military environment. The source thought this group would welcome war, even if all it did was end the boredom of their lives.

Office Workers at Factories and Enterprises

This group includes people who work in offices at enterprises and factories, but not office workers in Government and Party organizations. Economically, office workers in this category are not so well off as factory workers and technicians in factories, except for office workers in cadre or executive positions.

Office workers, unlike members of a work team who receive bonuses for overproduction, do not receive bonuses, except in cases when the whole enterprise or factory receives a bonus. Office workers are held responsible for what goes on in the enterprise or factory, even production, because they are considered responsible leaders. But they do not receive pay commensurate with the responsibility.

These office workers generally want to become qualified as technicians so that they can be reassigned to better jobs and earn more money. They, of course, would also like to be promoted in their present jobs, but in promotion, political activity is more important than job performance.

Fishermen

The source thought that significant grievances among fishermen included long hours of hard, dangerous and uncomfortable work, long days at sea and away from home, and the prohibition against taking any fish caught to their homes when they returned to port. He believed that many fishermen would prefer—even desire—to obtain jobs on land.

Agent Trainees

Agent trainees are commonly afraid they will be killed on their missions in the ROK. This fear grows on them after they have been in training for awhile and become aware of technical and operational problems associated with successfully conducting missions in the ROK. The source said that once agent trainees realize the difficulty of their missions, they became greatly concerned about their lives and lose confidence in their ability to accomplish their missions in the ROK. Source said that this is a common psychological attitude among agent trainees. Most of them put their faith in fate and luck and hope for a miracle in accomplishing their missions.

Another psychological problem for agent trainees is worry about and longing for their families, especially about what will happen to the

families if they fail while on their mission and are killed. These worries increase the longer they are in agent training.

Source said that, of course, while in training, agents are told that their job benefits the people and country and that they are revolutionaries. However, the source said, agent trainees still suffer from a growing worry about the future, about what will happen to them. This is aggravated when agent trainees, as part of their training, become more familiar with the situation they will face in the ROK. The source said some agent trainees pretend to be sick in an effort to obtain release from training and be sent home.

Repatriates from Japan

The source said that generally repatriates from Japan regretted that they had come to North Korea once they are aware of the generally low living standards and the many restrictions normally placed on people in North Korea. Some repatriates, of course, were happy in North Korea; these had mostly been peddlers, day-to-day workers, or jobless in Japan. It was this happy group that was exploited in North Korean propaganda.

RECOMMENDATIONS ABOUT LEAFLET OPERATIONS DIRECTED AGAINST NORTH KOREA

The source reported that while in North Korea he had seen some leaflets from the ROK. Based upon his experience with them, he made a number of recommendations:

1. According to the source, in leaflet operations, as in radio broadcasting operations, three key points should always be considered: theme selection, credibility, and repetition and continuity in the dissemination of the message.

2. A leaflet should be simple and clear with regard to message. The text should not be long and small letters should not be used because then the leaflet cannot be read easily and quickly. If a leaflet is simple and clear, the person who picks up the leaflet should be able to catch the message and outline at a glance.

3. In North Korea, farmers and workers are enjoying some benefits—employment, education for their children, and welfare. Therefore they consider that their lot is now better than it would be under a capitalist society. They do not think that changing to a capitalist society would benefit them. The source recommended that leaflets convey messages to them to allay any fears they might have about living under a capitalist society and to show them that in actuality their circumstances would be improved.

4. When taking photographs for leaflets, care should be taken in selecting sites to be photographed that demonstrate real benefits to the people, rather than producing just a pretty picture.

5. In leaflets, where possible, use comparisons between the ROK and North Korea. To do this, review and analyze themes used in North

Korean propaganda output and other sources to determine North Korean vulnerabilities. Take those vulnerabilities with superior points found in the ROK. For example, North Korea emphasizes its education system in its propaganda; vulnerabilities should be found in North Korean education. Then leaflets can be prepared based upon these identified North Korean vulnerabilities, which emphasize the strong points on these specific topics in the ROK educational system.

North Korea continually emphasizes that life is better in North Korea than in the ROK; however, on closer scrutiny of both, it will be found that in the ROK things are generally superior to North Korea. For example, North Korea claims to stand for socialism and for the welfare of farmers and workers. In practice in North Korea, this is not true. The treatment of dead soldiers is an example of this fallacy. They are buried in unmarked graves on the battlefield; only high-ranking North Koreans are honored with tombs. In the ROK, however, those who die in the defense of their country, regardless of rank, are buried and honored by all at the national cemetery.

6. The source considered that for leaflets the following two themes were important: basic living conditions (food, clothing, and housing) of average people in the ROK; and social welfare, cultural, and material benefits of life in the ROK.

7. Regarding leaflet preparation, the source recommended that the best quality of paper be used. This will reinforce the idea of a prosperous paper industry in the ROK. Also, paper should be used that is durable so that the leaflet can be read even though exposed to the elements. Printing and photo reproduction should be clear. Color leaflets are preferable to black and white leaflets to attract the attention and interest of the target audience. Size of the leaflets is not important. Source said that the size of the leaflets from the ROK he had seen in North Korea was appropriate. Source said that the type faces used should be clear and attractive; small type should be avoided. Use short texts and an abundance of photos. If the text is too long the reader may become bored and not read the entire message. He suggested the use of photos with clear captions so that the meaning or message of the text can be caught at a glance. Source said that this was very important in leaflet operations, that long booklets with a lot of text would not be effective, but pamphlets printed on good paper with many color photos would make positive impressions.

8. Source recommended that special leaflets be prepared for use against North Korean soldiers. The upper half of the leaflet could have a calendar, photos of pretty female Korean movie stars, or photos of nude females. The lower half of the leaflet could contain the PSYOP message. Then the leaflet could be cut in half and the photos or calendar retained by the soldier, and the message disposed of after being read. Such leaflets could be printed on one or both sides. If printed on both sides, on the reverse side of the part bearing the photo or calendar could be printed the music and text of Korean popular songs, with the bottom half bearing a

PSYOP message. Source said that the reason for this suggestion was that he believed that not enough calendars were issued to North Korean army soldiers. Most young soldiers, while in the army, did not have much chance to see or be with girls, but they did think about them a lot. Therefore they would especially welcome color photos of the faces of pretty Korean girls and nude color photos. By printing the leaflet so that half could be disposed of and half retained, the soldiers would be able to keep the calendar or photos without danger to themselves. Source said that although some soldiers would interpret the use of nude photos as a sign of degeneracy of morals in the ROK, most North Korean soldiers would welcome the leaflet and not turn it in to their leaders.

The source said that North Korean soldiers learned the words of Korean popular songs by hearing them over ROK DMZ loudspeaker broadcasts. The use of printed versions of those songs on leaflets for North Korean soldiers near the DMZ would reinforce this.

9. Regarding dissemination of leaflets, the source said that massive dissemination of leaflets in one place at one time should be avoided for the reason that if it were done, social security authorities could easily have them all gathered up and confiscated.

The source considered the best time for disseminating leaflets to be at night, preferably after midnight and before dawn, so that the leaflets could not be seen falling to the ground.

He also recommended that leaflets not be disseminated in remote mountainous areas of low population density for the obvious reason that there were too few people to see them. On the other hand, leaflets should not be dropped on densely populated areas, because the number of people would inhibit reading of the leaflets because of observation by others. Therefore, he suggested that they be disseminated to areas of moderate population density where the person who found the leaflet would have a reasonable chance of reading the leaflet unobserved.

10. Although the source had never seen or heard about the use of plastic bags floating on water as a delivery means for leaflets and other materials, he said that type of operation was, in his opinion, excellent and a well-suited PSYOP delivery method to reach the target audience. He recommended as gift items for inclusion in the floating plastic bags the following:

- | | |
|-------------------|--|
| <i>Pojagi</i> | A square cloth designed to carry articles. <i>Furushiki</i> in Japanese. |
| <i>Indan</i> case | Container for carrying a type of medicine used for sweet-smelling breath. <i>Indan</i> is available in North Korea, but the containers are not good. |
| Handkerchiefs | |
| Soap Containers | |
| Shoe horns | |
| Combs | |

Certificate or money case
Children's toys
Children's fairy tale books
Picture books for children

Source recommended that in sending such gift items, the best quality items should be used for greater effectiveness. He said that this would achieve two purposes: (1) show the excellence and high quality of ROK goods to the target audience, and (2) create in the target audience dissatisfaction with North Korean goods, especially when in actual use the ROK items lasted much longer and were better than North Korean-made equivalents. If the aim is to create an immediate impression of excellence of the item, then the brand names of ROK manufacturers or some other indication of ROK origin should be clearly seen. But if the aim is to emphasize the superiority of the item based upon actual long term use, then there should be nothing on the item to indicate origin in the ROK.

RECOMMENDATIONS ABOUT RADIO BROADCASTING OPERATIONS DIRECTED AT NORTH KOREA

The source provided a number of recommendations which he said should be considered in PSYOP radio broadcasts directed against North Korea.

1. Radio broadcasts have the capability to send messages covering a wide range of topics and themes to the North Korean target audience. However, only one topic should be treated in each program unit.

2. News programs, in particular, are very important for informing North Koreans about what is happening in the rest of the world. But because North Koreans find it difficult to listen to foreign radio broadcasts, it is very important to repeat news programs over and over so that the news will have a better chance of being heard. Repetition of a news broadcast ten or twenty times is good—the more repetition the better the chance that it will be heard.

3. The source recommended that priority be given in news selection to those themes listed in "PSYOP Themes for North Korea," *PSYOP Intelligence Notes*, No. 251.

4. The source reported that of all target groups in North Korea, agent trainees have the best opportunity to listen to radio broadcasts from the ROK. He recommended the use of special programs directed to agent trainees to induce their defection after they have been sent to the ROK. He stressed that programs should be built around the lives of North Korean agents and others who defected to the ROK. North Korean agents, according to source, do not know what treatment they will receive if they turn themselves in to the ROK Government. Therefore he recommended that special programs be regularly produced about benefits to agents who turn themselves in when they are sent to the ROK.

5. The source said the best time for listening to foreign broadcasts in North Korea was from 8:00 P.M. to 11:00 P.M., because people are more likely to be at home during this time. Before 8:00 P.M. people are often still at work, meetings, or engaged in other activities. People usually have returned home for the night by 8:00 P.M. to 11:00 P.M. The time does not matter, really, to those who like to listen secretly to broadcasts from the ROK; they will do so when they can. Also, agent trainees have good opportunities to listen to ROK broadcasts at night.

6. Regarding sentence structure used in broadcasts, the source recommended the use of short sentences, rather than long complex ones. Short sentences are easier to understand than long ones with complex construction.

7. To attract the interest of the North Korean audience, the source suggested that Korean popular songs, especially those popular from the end of World War II until the end of the Korean war be used. Recent Korean popular songs can be used if they are in Korean rather than Western musical style. He advised against the use of recent Korean popular songs with Western musical arrangements and instruments.

CREDIBILITY IN PSYOP DIRECTED AGAINST NORTH KOREA

The source provided a number of recommendations regarding credibility in psychological operations against North Korea.

1. Cite or quote the objective views and opinions of foreigners about the subject matter: for example, their views about the ROK. He considered that the views of people from neutral nations would be more effective.

2. In developing, preparing, and editing programs care must be taken to insure that the content is not superficial and abstract. Exact sources, detailed statistical figures, concrete and actual examples should be provided, and all should be focused on a specific, limited topic or subject.

3. Terminology should be used which is easily understandable to all North Koreans. Avoid words of foreign origin because they may not be in use now in North Korea, and therefore not understandable to North Koreans. Add explanations where words are given that are used in the ROK but not in North Korea.

4. Use live interviews with people on the street in radio broadcasts to North Korea. If possible, interview working-level people such as factory workers and farmers, rather than high-level officials.

5. Avoid use of abusive words and slander in PSYOP output. Instead, take a sympathetic and polite position in order to persuade the target audience.

6. Use dialogues between two voices over radio rather than one person reading a script. This, the source said, will help overcome the monotonous effect of one person reading.

7. Announcers should use a clear, natural speaking style rather than a strident, ardent style. The source said that announcers on North Korean

radio used the strident, ardent style of agitators; he did not consider this to be effective. Instead he preferred the natural, calm voices of the announcers he had heard on stations from the ROK. The source said that while he was in North Korea, he listened mostly to news programs on KBS 1, but on many occasions he considered the announcer's reading speed so fast that it was difficult to follow what was being said. He, therefore, recommended that announcers avoid excessive speed. Also, he noticed that KBS 1 used many words of foreign origin; this also made the programs difficult to follow.

8. For credibility, the source recommended that programs should take a neutral, objective viewpoint. They should take a position between the Western countries and the Communist nations. In the period before 1965, North Koreans considered Japanese news reporting credible because North Koreans believed that the news took a neutral, objective position. As a result, North Koreans listened to and believed Japanese-originated news broadcasts. Since 1965, according to source, because of Japan's closer relations with the United States and the use of the theme of the revival of Japanese militarism in North Korean propaganda, the credibility of Japanese news among North Koreans has fallen.

9. The source recommended coverage of rural affairs as a way of enhancing credibility. Generally, North Koreans believe that under capitalist societies, cities are emphasized while rural areas have withered from lack of attention.

NORTH KOREAN PROPAGANDA DISSEMINATION TECHNIQUES IN THE REPUBLIC OF KOREA

The source had some knowledge of the dissemination of North Korean propaganda materials in the ROK, gained through conversation with others while he was in North Korea.

He reported that North Korean leaflets were disseminated in the ROK through the use of balloons drifted down from North Korea. He knew that not only leaflets but also booklets and pamphlets were disseminated in this way. He believed that a certain section of the Liaison Department of the Central Party was responsible for such balloon operations.

The source also believed that some North Korean agents were used to disseminate materials in the ROK. He said that North Korea utilized two types of agents for propaganda dissemination in the ROK: long term, in-place agents, and those dispatched on missions to the ROK. In some cases, North Korean propaganda materials were carried into the ROK secretly by couriers and placed in caches. The agent-in-place was told by radio where the cache of propaganda materials was. He then went to recover them. In other cases, agents dispatched on missions to the ROK carried the propaganda materials with them.

The source mentioned as an example that in April or May 1967, six fellow trainees and himself were sent to a safe house in North Korea and divided into two teams, one of four men and the other of three. The two

teams were placed in separate rooms in the safe house. The source was assigned to the three-man team. On each team there was one man who had attended the "695", a special political school for indoctrinating agent trainees. These two persons arrived at the safe house first, and then the source and the others arrived. A package of North Korean propaganda materials was given to each two-man team, about 200 or 300 booklets. The plan was for each team to carry its package of propaganda materials to a location on the West Coast area of North Korea. The planned training exercise, however, was not carried out because other missions were given to several members of the teams.

The source mentioned that he believed that another method used to disseminate North Korean propaganda materials in the ROK was carried out from Japan through *Chosen Soren* (Association of Korean Residents of Japan).

According to the source there were two purposes in disseminating North Korean propaganda materials in the ROK: (1) to convey the leaflet and booklet themes to the ROK target audiences, and (2) as a communication means between a North Korean agent in the ROK and his headquarters in North Korea.

If a North Korean agent brought propaganda material with him into the ROK, he might disseminate it himself, get another person to disseminate it, or have an agent-in-place do the disseminating. Usually, agents or others disseminated the leaflets during the hours of darkness, but not during the ROK curfew, 12 midnight to 4:00 A.M., for fear of being caught by ROK police for violating the curfew. First, a target was selected where the leaflet was to be disseminated in accordance with the theme of the leaflet. For example, if the message attacked the United States, then the leaflet target would be a U.S. compound. The agent then tried to get the leaflets into office areas, toilets, desk drawers, and the like. On some occasions, leaflets were disseminated widely, regardless of the PSYOP theme, if there was a good opportunity for distribution. When there was no wind blowing an agent might put groups of leaflets on the top of walls, and when the wind came up later it would blow the leaflets around.

If the agent was busy with other missions, he might try to get someone else, such as an agent-in-place, to disseminate the leaflets. If an agent believed he had recruited someone as a potential North Korean agent, he might give the prospect the task of disseminating some leaflets to test him out. When giving the prospect the task, he was assigned an exact time and place to disseminate the leaflets, and then the North Korean agent would check to see that he carried out his mission.

A North Korean agent who did not have radio communication means could use leaflets to communicate with his headquarters. For example, at the end of some North Korean leaflets, on the back side, the agent would write the name of a certain society or association and some numbers to indicate that the agent desired to return to North Korea on a certain

date, for example, 11 Battalion, 5th District. In this case, "5th" means the month of May and "11th" means the 11th day of that month. The agent places this information on a number of leaflets which he then disseminates. North Korean agents believe that when leaflets are disseminated they are reported in ROK newspapers, or an agent-in-place might find the leaflet and report it to North Korea. In either case, the aim was to get information about the agent's desire to return to the proper authorities in North Korea. Each agent, before dispatch to the ROK, was given a different message to use on leaflets for communicating his desire to return to North Korea. Thus when such a message was acquired by North Korea, it was known which agent was communicating the message.

Broadcasts

RADIO BROADCAST MONITORING*

By the 7TH PSYOP GROUP

An example of how content analysis of a radio broadcast, by indicating the relative emphasis that the source wishes to place on propaganda themes, may provide valuable insights into political objectives and strategy.

KHMER REPUBLIC

Stations considered in this report are *Hanoi international*, *Liberation*, *Voice of the National United Front of Kampuchea (VNUFK)*, *Peking*, and *Moscow*. This report covers the period 11–17 December 1971. All broadcasts were in the Cambodian language.

Hanoi international and *Liberation* stressed continued support for peoples struggles. They stressed such topics as the downing of U.S. helicopters, comments by Sihanouk on the failing Lon Nol administration, combat victories of CNPLAF units, and a report in which a Vietnamese Student Association located in Hue condemned the use of Saigon troops in Cambodia. CNPLAF units claim total defeat of Lon Nol's CHENLA II operation.

VNUFK continued broadcasting about the combat victories of CNPLAF units. An 88-minute speech by Sihanouk (31st message, part II) was used to propagate support for people's struggles.

Peking placed primary emphasis on international prestige; however, the amount of time devoted to the attendant themes, support for people's struggles and negative treatment of an established government, were of significance. International affairs were the keynote this week with references to the People's Republic of China (PRC) ambassador's party in Hanoi, the Albanian visit to Peking, NUFK and RGNUG delegations to Pyongyang, and development of communications in the mountain regions of Chekiang Province. In support of people's struggles, *Peking* extolled the success of PLAF units for victories in Cambodia and Laos. Much time

*Excerpts from "Communist Propaganda Radio and News Service Highlights: Trends and Analysis," Issue no. 51-71, 27 January 1972, pp. 51-16 to 51-18.

Weekly Trend Analysis (11-17 December 1971). Broadcasting in the Cambodian language to the Khmer Republic.

was devoted to condemning the Indian and Soviet governments for involvement in the Indo-Pakistani war. It was claimed that Indian warplanes bombed Dacca and killed civilians. South Korean President Pak Chong-hui was denounced for declaring an emergency when China was admitted to the UN.

Moscow continued to expound on the Soviet Union's role in world affairs in its quest for international prestige. The USSR continues to condemn U.S. involvement in Indochina affairs and to attempt to align Peking in collusion with the United States in some items.

Comment

Hanoi international, *Liberation*, and *VNUFK* will continue to support people's struggles, with little or no change in future formats.

Peking will continue to stress international prestige; however, an increase in the negative treatment of the Soviet and U.S. governments has been noted. The split between Peking and the Soviet Union is still evidenced by such commentary as "The Soviet Social Imperialists are the Master of the Indian Expansionists."

Moscow continues to stress foreign relations and express Soviet gains in economic and industrial efforts. Under the new Five-Year Plan, the USSR promises to have one-third of the Moscow population in new housing. The soft landing on and exploration of Mars received extensive coverage. Negative treatment of the Peking and U.S. governments is becoming a recurrent theme. The USSR has persistently condemned U.S. involvement in Indochina, the hypocritical nature of the U.S. stance on the Indo-Pakistani conflict, and increased U.S. air activity in Indochina. The PRC was denounced for collusion with the US in an attempt to impede the Soviet disarmament conference.

Captured Documents

VIET CONG DOCUMENTS ON THE WAR (1)*

This report illustrates that document analysis is an important tool for understanding the target's perceptions as well as for remaining abreast of foreign military and political strategies and activities.

Since the early part of 1967 increasingly large quantities of Communist documents have been captured during military operations by American, South Vietnamese and Allied forces. Especially rich caches of highly-classified documents and operational directives were found in headquarters areas during operations "Cedar Falls" and "Junction City" directed against long-established Viet Cong base areas. Among these were top-level internal communications of the Viet Cong movement, many of which have been officially released for use by the press and by scholars.

*Excerpts from "Viet Cong Documents on the War (1)," *Communist Affairs*, V, no. 5 (September-October 1967), pp. 18-24. Reprinted with the permission of *Communist Affairs*, copyright holder and the author, Hammond Rolph.

These documents range from general analysis of the world situation and the strategic role of the Vietnamese Communist revolution to the exposition of tactics for implementing the revolution in the villages and hamlets of South Vietnam. In this and the next issue, *Communist Affairs* will present excerpts from some of these lengthy documents, most of which have not been comprehensively quoted at any length in this country and are therefore still relatively unknown. The selections illustrate not only the policy problems and decisionmaking environment of the Viet Cong movement, but also convey something of the Vietnamese Communist's view of his world.

In general, the documents reveal or confirm the following: (1) the tight control of the levers of power in the Viet Cong movement by the *Lao Dong* Party of North Vietnam, and the insignificance of the National Liberation Front for South Vietnam as anything other than a tactic in the struggle; (2) the complete faith of the Vietnamese Communists in the doctrine and strategy of "people's war" as a road to certain victory; (3) a rather realistic sense of weakness in the Viet Cong movement, coupled with a grossly exaggerated view of the defeats and problems of the other side; (4) great stress by the Communists on a military victory within a relatively short time, while simultaneously preparing for protracted war and anticipating the use of the political weapon of negotiations at a propitious time; (5) emphasis on the international revolutionary role of Vietnamese communism; and (6) the absolute primacy of ideological motivation and purity in all aspects of the direction of the Viet Cong movement.

Chronologically the documents range from the end of 1963 to the spring of 1967. Thus they cover a period from Hanoi's confident decision to escalate the war decisively in the South following the death of Ngo Dinh Diem to the present situation of great difficulty for the Viet Cong.

LAO DONG PARTY SETS TONE OF WAR IN SOUTH

One of the basic documents captured in the field is the resolution of the ninth plenum of the Vietnam Workers Party (*Lao Dong*) Central Committee in Hanoi, passed in December 1963. Entitled "World Situation and Our Party's International Duties," it presents a lengthy philosophical and doctrinal rationale for the Vietnam struggle, largely in terms of the demands of "proletarian internationalism" and the global requirements of the socialist camp. The resolution was prepared in the immediate aftermath of the downfall of Ngo Dinh Diem, which undoubtedly somewhat weakened the basis of the Viet Cong movement through the removal of its chief target, and it seems to represent a call by Hanoi for acceleration of the armed struggle in the South despite the changed political situation. Adopted during the period of Hanoi's marked leaning toward the Chinese side of the Sino-Soviet dispute, it reflects a strongly hostile tone toward "revisionists," while at the same time expressing Hanoi's desire for a mediated truce which would restore the unity of world communism in pressing toward its national and international goals.

In the present human society, there are the following basic contradictions: (1) contradictions between the socialist camp and the imperialist camp; (2) contradictions between the working class and the bourgeoisie in capitalist countries; (3) contradictions between the oppressed people and the imperialists and colonialists; (4) contradictions between imperialists and imperialists, between one monopolist capitalist clique and another monopolist capitalist clique in imperialist countries.

The four above contradictions are basic contradictions in human society because they reflect the true nature of the era, they survive ... during the entire phase of evolution from capitalism to socialism throughout the world. The first group of basic contradictions belongs to the contradictions between two opposing international systems. The other basic contradictions belong to the internal contradictions of the international capitalist system.

CENTRAL OFFICE FOR SOUTH VIETNAM CARRIES OUT CENTRAL COMMITTEE DIRECTIVES

Following the earlier resolutions of the *Lao Dong* Central Committee, the situation in Vietnam underwent a great change. In response to increased North Vietnamese army participation in the Southern war, the United States began aerial bombardment of key North Vietnamese military targets in February 1965 and made a full-scale combat commitment of American troops in the South a few months later.

In the face of this massive American intervention, the Central Committee 12th plenum met in Hanoi in December 1965 to lay down new guidelines. These new policies were then translated into directives by the Central Office for South Vietnam (COSVN), the Viet Cong's highest echelon of political and military direction (the NLF being a facade with no real power). COSVN, which is an integral part of the *Lao Dong's* interlocking machinery and which acts as a Central Committee for Southern operations, then called its fourth congress in March 1966 to translate the 12th plenum's guidelines into an all-encompassing "Resolution of the Central Office for South Vietnam." A copy of this top-secret document was seized on April 21, 1967, in Khanh Hoa Province by units of the 101st Airborne Division.

This resolution covers almost every aspect of Hanoi-COSVN plans and programs for the Viet Cong, from high-level matters such as peace negotiations to detailed village-level activities. Thus only a fraction of it can be quoted here. The document is quite open in discussing Hanoi's leadership of the war, and one of its central themes is the need to increase the Party's control of all Viet Cong activities. While pointing out the importance of the NLF as a useful united front tactic to be developed to the utmost, the resolution nowhere indicates that the Front has any real decision-making authority whatsoever.

First, the document reviews the military and political situation in 1965, both as to successes and failures, strengths as well as weaknesses.

1965 was also a year when we all marched forward to win victories. Our entire army, people, and Party strongly stepped up their activities in all fields and all the movements achieved great successes in the midst of an extremely arduous situation.

a. Our major success was in the military field.

All the three forces expanded and fought the enemy well. Our guerrillas succeeded in causing the attrition of and destruction to both the U.S. and puppet

regime armies with very brave and creative forms of combat in resisting mop-up efforts, attacking communications lines and the enemy's rear. But most outstanding of all were our regular forces which came upon the battlefield in a bigger operational force and with increasingly creative combat tactics. . . .

For that reason, in the effort to destroy the enemy, we overfulfilled the norm prescribed by the Central Office for South Vietnam at the beginning of the year. Concerning the build-up of the armed forces, we moved quickly, over-passing the regular force and regional force build-up requirements. . . .

b. Our second success was in the political field. . . . We broadened the National Front to unite all classes and social strata and ethnic minorities in the same effort of rising up against the Americans to save the country.

* * * *

In the disputed rural areas and at strategic hamlets, we continued to score successes.

* * * *

. . . in spite of the hard conditions, the morale of our partisans remained unshaken and united. . . .

. . . yet there were still deficiencies, difficulties, and weak points:

Our armed forces developed considerably but still did not meet the requirements of the situation.

Only half of our regular forces fought well. The regional forces mostly did not fight well and some of them hardly fought while others were so embarrassed that they could not fight. . . .

Political activities and Party tasks . . . were still poor among the regional forces in certain areas. Therefore, there were many incorrect displays of ideology, behavior, and activities. . . .

Although the liberated zone was expanded, it was not yet consolidated and no solid base was established there which could serve as a stable rear for the South.

* * * *

. . . The revolutionary base in the cities was still too weak.

* * * *

Political struggle activities were not brought up to the same rate as military activities and did not keep up with military achievements. . . . Not enough emphasis was given to the ideological leadership of the masses and to the task of breaking up the enemy's psywar and Chieu Hoi schemes [Editor's note: a program designed to encourage defection from Viet Cong ranks] and his peace trick swindles.

* * * *

. . . Mass organizations especially at the village levels were not well built.

Leadership and indoctrination of the masses were also weak. . . .

The unsatisfactory state of mass proselyting activities affected other activities, especially those pertaining to recruitment, conscription, finance, prevention of spies, protection of secrets, guerrilla warfare, etc.

Activities related to the building of the Party, especially those pertaining to organization, were still weak. . . .

Next came an evaluation of enemy intentions and the prescription of general strategy to counter them. Party leadership is emphasized in all aspects of struggle, particularly in the matter of peace negotiations.

In general, in 1966, the basic intention of the enemy will be to carry on the major plans laid down in 1965, but they will do it with new vigor, more wicked schemes and a higher determination. Therefore, the war will develop in a more fierce manner.

In the face of the new situation, the mission for the entire country as prescribed by the [12th] resolution of TW [Hanoi Party Central Committee] is as follows:

"All the Party, the army, and the people should exert the maximum effort and concentrate all forces to step up the armed and political struggles, to defeat the American imperialist aggressors and their henchmen on the main battlefield which is in the South.

In the North, the war of destruction of the American imperialists must be defeated, the achievements in the development of a socialist regime must be preserved, human and material resources must be mobilized for the liberation war in the South, and preparations must be made to defeat the enemy in case the local war is expanded throughout the country.

* * * *

... while continuing to acquire a thorough understanding of the long-term resistance slogan and in applying it, we must exert a maximum effort to concentrate the strength of both zones of our country in order to achieve a decisive victory on the Southern battlefield within a relatively short period of time.

... we are determined not to entertain any illusions concerning a negotiated settlement to the problem of Vietnam, and we must concentrate all our strength to destroy the enemy. Only when the American imperialists' aggressive will is crushed and the objectives of independence, peace, democracy, and neutrality of the South are guaranteed can we negotiate a settlement of the Vietnam problem.

... At a certain time, we can apply the strategy of fighting and negotiating at the same time, in order to support the armed struggle, and thus accelerate the disintegration of the puppet army and regime, and create more conditions favorable for our people to win a decisive victory.

... That objective can only be achieved if we coordinate very closely the armed struggle with the political struggle and psychological warfare. . . .

The Southern branch of the [Lao Dong] Party has extensive and solid foundations. It is a valiant vanguard element, thoroughly trained in combat, closely connected with the masses and fully trusted by them. It is well experienced in the matter of political and armed struggle and it is also closely led by the Party Central Committee."

In order to carry out the general mission, major tasks are then assigned in detail. Included among these assignments are build-up and deployment of the armed forces, political leadership in the armed forces, expansion of the united front under the Party's guidance, diplomatic efforts abroad, consolidation and expansion of the Viet Cong base areas, defeating the enemy in the contested areas, clarification of agrarian policies, improvement of mass proselyting [sic] campaigns and development of the Party's strength.

We must strongly emphasize armed warfare, build up our armed forces, expand the people's guerrilla movement, destroy a major portion of the American and puppet forces. During 1966, . . . we must try to inflict a loss of 30,000 or 40,000 American personnel, including the total destruction of about 10 battalions and some scores of companies. We must also destroy and disintegrate about 200,000 puppet troops, over a half of whom will be regulars, . . .

All the armed forces, from the regular forces to the regional forces, shall be responsible for participating in, assisting and emphasizing guerrilla warfare.

* * * *

... Regulars must retain the initiative in the attack to destroy the enemy. . . . Regular warfare must be active, mobile, flexible, aggressive and must be victorious.

* * * *

All our armed forces must be sharp instruments of both armed and political struggle. . . .

Efforts must be made toward mobilizing the youths and the populace to insure the replacement of regular forces and to provide vanguard elements and civilian manpower in service of the battlefield.

* * * *

Increase the Party's political and leadership activities in the armed forces.

... In the armed forces, maximum attention must be paid to building up the Party, especially the basic structures, . . .

In the field of leadership, class lines and the mass viewpoint must be maintained; . . .

The front for national unity, anti-American resistance, and national salvation must be expanded, the political and military proselyting [sic] movements must be intensified.

* * * *

We . . . have the capability to motivate the partiotic sentiments of the people in various social strata and walks of life, to win over even those in the puppet regime and army who follow a progressive trend . . . in order to expand the National Front for the Liberation of South Vietnam, . . .

. . . we must try to implement democracy, step by step, to secure the interests of the working classes, especially the farmers. The expansion of a national solidarity front must be founded on the close unity of the masses and a consolidation of the workers-farmers alliance.

* * * *

. . . the Americans and puppet regime exhort their "peace trick" slogan, intensify their psywar and espionage activities, intimidate and bribe the people by flattering them with plans of "rural development," "social revolution," "democratic regime," etc. . . . hoping to deceive and lull all our people, weaken their combat morale, make them suspicious of our victory, and moving ahead with their Chieu Hoi plans. This dangerous plot of the enemy has somewhat affected the combat morale of our people in certain areas. Therefore, breaking up the enemy's political schemes and indoctrinating the people are two things that must be done on a regular basis. . . .

We must intensify our propaganda and diplomatic activities.

In our anti-American resistance for national salvation, we depend mainly on ourselves but we also need the sympathy and support of our friends in the world. Furthermore, our revolution is part of the world revolution. It is related to the movements of national liberation on the continents of Asia, Africa and Latin America, and it is also related to the preservation of the socialist camp and world peace. For that reason, we must do our utmost to gain the support and assistance of the socialist camp, the people of the world, the American people. . . .

The diplomatic requirement at this stage is to concentrate all efforts . . . to gain the sympathy and support of the socialist countries, the people of the world, including the American people, and to isolate to the maximum degree the American imperialists and their henchmen.

* * * *

Consolidate and expand the liberated areas and establish bases to provide rear support of the revolution, destroy the enemy's pacification plan, continuously attack the enemy in cities and areas controlled by him, and restrict the enemy's rear.

* * * *

. . . in order to help our three strategic zones develop and support . . . the accomplishment of the mission prescribed by the Party for the Southern revolution, we must fully understand the following:

We must constantly seek to develop and expand our bases and liberated areas in both the jungle and delta and secure a solid base for the revolution. Along with that, we must continuously attack the urban areas and those enemy-controlled areas to disrupt and restrict the enemy's rear areas. Those are the two points of the party's great strategic mission. Accomplishment of one is not enough but would also be ineffective. [sic]

* * * *

. . . Defeating the enemy's pacification plan is an urgent requirement. If we cannot meet this requirement, we will be unable to build up our rear and disrupt and restrict the enemy's. Vice versa, if we cannot strengthen our rear areas, we will be unable to defeat the enemy's pacification plan. . . .

We must thoroughly understand the Party's general strategic principles concerning the leadership of the movements in the delta, the rural areas, the jungle and in the urban areas. . . .

. . . We must try to convert a major portion of the enemy-controlled areas into disputed areas (some into liberated areas controlled by us), to convert a major

portion of the presently disputed areas into liberated zones where our control would be firm, and at the same time, we must devote all our efforts toward securing, developing and expanding our liberated and base areas . . . so as to convert a major portion of the areas under his control into disputed areas or liberated areas controlled by us.

* * * *

Local and external forces must be coordinated and armed activities must be coordinated with local mass movements. Reactionary organizations must be destroyed. The tyrants and their public control organizations (including the police, security, pacification, and reactionary elements) must be attacked. . . .

In guiding all kinds of activity, we must always and steadily maintain the objective of the uprising in the rural areas. . . .

. . . we must cleverly maintain the legal status of the people, a positive legality, which would permit the constant carrying out of our political and armed struggle movements in pulling down the enemy's influence.

One of the decisive prerequisites is the development of sound political organizations to include strong Party chapters able to lead the masses in the fight against the enemy, and into which the masses themselves are organized.

* * * *

The requirements of the liberated rural areas consist in holding on to the land and people and making decided efforts to prevent the enemy from taking over additional land and herding the people to his areas. . . .

. . . Strive to ideologically motivate the people so that they will step up their resistance. . . .

We must realize that the main point in the defense of the liberated areas lies in the fact of maintaining our control over the population and, most of all, in nurturing the fighting spirit.

. . . People must be determined to struggle against the enemy, to cling at all costs to their paddies and villages, to step up production for national salvation, to tie their personal interests to those of the revolution and resistance. . . .

* * * *

Reality shows that recently in order to avoid airstrikes, the population have left their lands and fled to the enemy-controlled areas. They then become homeless and penniless and their lives are miserable. For this reason, if we can perform well the tasks of protecting the people's interests, lives and properties, and of production, suitably in the new situation, and the relations between the people and Party are close and firm, they then realize that the Party really cares for them and will cling at any cost to their native villages for combat and production.

* * * *

Great efforts must be made to achieve solidarity in the rural areas, to implement the Party's agrarian policy well and the Party's class lines which state that: "Based on the unity of poor, middle and rich peasants, we are trying to gradually topple the landlord class, to win over those landlords desirous of joining ranks, neutralize the fence-sitters and smash those wicked landlord agents of the American imperialists."

* * * *

The urban areas and cities have to meet the following requirements:

According to the situation in each locality, uninterrupted attacks in every form and size must be launched against the enemy in order to create constant disturbances even in the enemy's safest rear bases. Movements in the cities and urban areas must be encouraged to catch up with those in the rural areas.

. . . We must capitalize on the differences existing within the enemy's camp, isolate and divide the diehards, win over the neutralists' sympathy, persuade the fence-sitters to take sides . . . [and] . . . to continuously expand the movement and create conditions for the forthcoming general attack and uprising.

* * * *

We must create and develop the movements among various classes, the laborers, the needy urban people, the petit-bourgeoisie, the students, and then gradually associate them with other movements and organizations to form a coalition front for widespread action, proceeding toward the development of a united front

with a platform inferior to that of the National Front for the Liberation of South Vietnam but endowed with the conditions to operate openly and to attract the above classes for a struggle against the Americans and their lackeys.

* * * * *

It is apparent from the expression of tasks in the cities that the Viet Cong have made little headway in the urban areas, despite the existence of substantial anti-government feeling in the larger population centers. Viet Cong leaders have also been dissatisfied with results in general proselyting [sic] among the civilian population. Their dilemma has become evident. On the one hand, they have worked hard, and not with great success, to move the peasant out of his world of narrow self-interest and to mobilize him for the larger goals of the revolution; on the other, it has become plain that in the context of the very personal suffering of rural families in the war, this effort has led to some alienation from the movement. The following excerpts illustrate these points:

Intensification of Civilian Proselyting [sic] Activities.

... in the recent past, our civilian proselyting [sic] activities have been too weak. We have not fulfilled the task of motivating, indoctrinating and assisting the people to settle those complex problems created for them by the war so as to enable them to carry out the resistance activities.

* * * * *

... Emphasis has been placed only on the mobilization task while the difficulties and problems of the masses remained incompletely understood.

The Party's cadres and personnel must remain close to the masses, particularly the workers and farmers, and must stand back to back with them, remain with them during moments of hardship and danger and not leave them in the lurch or stay aloof from them even under easy circumstances.

* * * * *

A large-scale mass motivation campaign must be opened . . . Nationalism must be promoted, sufferings pointed out, national and class hatred provoked. . . . Mass organizations must be strengthened and developed, . . . so as to enable the Party to secure its control over the elements of the populace—farmers, youths, women in the rural areas, liberation unions and syndicates in cities. . . .

* * * * *

The class factor must be viewed as the key factor. But due consideration must also be given to an individual's character, age, and walk of life. In the meantime, efforts must be made to attract and gain the middle classes.

* * * * *

We must be more enlightened on the position of the farming class, consolidate our control over the rural areas, strengthen the poor and middle farmers' unity and make them an active force of the Party in the rural areas. . . .

We must penetrate into the religious masses and motivate them, promote their nationalist spirit, . . . prevent them from being fooled by reactionary elements. . . .

With regard to the ethnic minorities . . . we must properly carry out the Party's ethnic policy, penetrate deeply into the masses . . .

With regard to the Chinese residents, we must continue to penetrate their masses and motivate them to unite with our people . . .

... The Labor Youth Group must have sound control over the youths, and must encourage them to join our ranks and in countering the enemy's conscription effort. We must motivate the women to participate in the political struggle . . . and assume activities in the rear area so that young men can go to the front.

Strengthening the Party, both ideologically and organizationally, is made the order of the day. Attention is to be concentrated on improving

the Party chapters, the key "grass roots" organization of the *Lao Dong* (or the People's Revolutionary Party, as its Southern branch is publicly known) in both the rural areas and towns. Again a dilemma appears. While the directive stresses the flexibility and initiative necessary to continue operation by lower echelons under difficult circumstances, it tends to defeat this purpose by calling at the same time for tight controls from the top. Thus it provides some explanation for reports from observers in the field that there is a considerable lower-level paralysis among the Viet Cong cadres in the absence of direction from above.

Increase the Party Development Activities

... Development must be efficient from both the ideological and organization standpoints so as to insure the unity of thought and action in the Party. Ideological development must be considered as the primary requirement.

First the entire Party, population and army must be indoctrinated so that all realize the sublime historical mission of our people. . . .

The effort of developing and promoting the class viewpoint among cadres and Party members in the days to come must satisfy the requirements of creating a spirit of perseverance, revolutionary optimism, readiness to overcome hardships and dangers and to accept sacrifices, determination to eradicate the enemy, to cling to one's area and to the populace, especially the workers and farmers, to share hardships with the people, to properly carry out every activity and not to be shaken by the enemy's peace trick arguments and his Chieu Hoi scheme. . . . Within the Party as well as among the population, the outstanding ideological problems, such as deviationism, conservatism, rightism, must be settled. . . .

* * * *

... we must see that the Party's political and ideological views are firmly upheld by using political and ideological indoctrination as a basic means to promote the position of the proletarian class in order to enhance revolutionary vigilance . . .

... we must increase counterintelligence and counterespionage activities. . . The Party's leadership activities must be increased. . . .

... it is necessary to improve our technique and to increase centralized leadership and, in particular, to strengthen the Party's absolute control over the armed forces. . . .

... In the days to come, the task of developing and consolidating the Party's chapters (especially in villages and cities) must be considered as a central effort in the task to develop the Party from the organizational standpoint.

* * * *

First we must start with improving each individual member of a Party chapter. This is accomplished by raising his political and ideological levels, making him thoroughly understand the situation and his mission, enhancing his will to attack and destroy the enemy, his determination to cling to the land, to the people, and to fight until the end. . . .

... Substantial assistance must be given to help each member of the Party to know what he is supposed to do daily, how to do it . . . we must proceed toward developing working methods, raising the political and organizational standards of committee chapters and chapter secretaries. Only thusly can we make the chapters capable of functioning by themselves under difficult circumstance and execute the policies from above without remaining passive as before.

* * * * *

Finally, a summary of the Viet Cong mission, in clarion tones:

... Our resistance for national salvation against the American imperialists, the most powerful and cruelest enemy of mankind, is occurring in the center of an area in which are concentrated the most serious contradictions in the world at the present time. Our resistance is part of the world revolution which is designed to liberate our people, and at the same time protect national independence, democracy and socialism throughout the world.

... the factors determining our ultimate victory are apparent. We have the correct domestic and foreign policies of a Marxist-Leninist party. We possess a

Central Committee which is clear-sighted and which is headed by Chairman Ho. We have the heroic army and people of the South, a people's war line which is matchless, a North which is solid and strong, and the increasing support of the socialist camp and people all over the world. . . .
. . . every individual leader and Party member must clearly perceive and be proud of his responsibility before history. . . .

Propaganda

ROMANIA—A CHINESE TOEHOLD?*

By the 7TH PSYOP GROUP

As evidenced in this excerpt, careful analysis of propaganda and news in a society in which both are controlled by the government can yield results useful for political forecasting.

At the present time, Romania seems to be successful in treading a relatively impartial line between the USSR and Communist China. Or, as stated by Emil Bodnares, Vice President of the State Council of Romania, "Romania aims at developing friendship, alliance, and cooperation with all socialist states on the basis of equality and mutual respect."

On 25 March, *Radio Peking* announced . . . that Cornel Burtica, head of the Romanian Trade Delegation and Minister of Foreign Trade, arrived at the Peking Airport. On 28 March, *Peking* reported that the Romanian trade official had met with Chinese Premier Chou En-lai, Vice Premier Li Hsien-nien, and Acting Minister of Foreign Trade Lin Haiyun. A second broadcast later the same day announced the signing of a trade agreement for 1970 by Burtica and Lin. On 1 April, the Romanian Trade Delegation left Peking by air, seen off by Romanian Ambassador to China, Aurel Duma, and Li Chiang, Chinese Vice Minister for Foreign Trade.

A *Radio Peking* broadcast on 19 April carried an article from the Romanian paper *Scinteia* which warmly praised the friendly relations between Romania and Communist China. Referring to the trade agreement which had been signed some three weeks earlier, the article stated that goods to be exchanged between the two countries would continue to be increased and diversified. After mentioning the strides made by Communist China in the field of industry and agriculture, the article concluded by stating that Romania was convinced that "the friendship and cooperation between Romania and China will be further developed."

A 19 April *Radio Moscow* broadcast in Mandarin to China reported that Nikolae Ceausescu, Secretary-General of the Romania Communist Party and President of the State Council of the Romanian Republic, had said that "Romanian people join people of the Soviet Union and people of other countries in commemorating the great Communist theorist and the revolutionary leader of the proletariat, Lenin." The Moscow broadcast went on to state, "The Romanian Party activist and statesman emphatically point out that the Romanian Republic values its friendship with Lenin's country and will henceforth develop cooperation between the two

*Excerpts from "Communist Propaganda Highlights: Analysis and Trends," Issue No. 25-70, 19 June 1970, pp. 25-27—25-29.

countries in order to consolidate the world socialist system and promote universal peace.”

On 9 June, *Radio Peking* ... reported the arrival of Emil Bodnares and the delegation of the Grand National Assembly of the Romanian Socialist Republic by special plane after concluding their visit to NK. On hand to greet them at the airport were Kang Sheng, Huang Yung-sheng, Li Hsien-nien, and Kuo Mo-jo. A second broadcast later the same day reported that Chou En-lai, Kang Sheng, Huang Yung-sheng, and Li Hsien-nien had held talks with Bodnares and Romanian Ambassador Aurel Duma. The speeches by Kang Sheng and Emil Bodnares at a dinner celebrating the arrival of the Romanian delegation that evening were carried the following day by *Radio Peking*.

The People's Daily carried a welcoming editorial on 9 June, which was broadcast over *Radio Peking* that day. The editorial praised Romania for maintaining its independence and sovereignty from “foreign aggression and interference.” The editorial then concluded, “We believe that the coming friendly visit to our country ... is bound to strengthen the traditional friendship between the people of China and Romania still further and make a positive contribution to the militant unity among the revolutionary people of the world.”

On 11 June, *Peking* domestic Chinese and NCNA English language service carried the texts of speeches made by Chou En-lai and Emil Bodnares at a banquet given by the Romanian Ambassador in honor of the visiting Romanian delegation. Chou reported that Mao Tse-tung and Lin Piao had met with Bodnares and the other Romanian guests and that cordial and friendly talks had been held on those questions that “concerned them both” and that “positive results had been received thereby.” Chou also took the opportunity to assail directly the US for its actions in Indochina. Without naming the Soviet Union, Chou alluded to US-USSR collusion in the division and maintenance of their respective spheres of influence and in their interference in the internal affairs of other nations.

For his part, Bodnares praised Communist China for its achievements in agriculture and industry, the launch of its first man-made satellite, and condemned the US for its actions in Indochina.

On 12 June, the departure of the Romanian delegation was reported on *Radio Peking's* English language service. The safe arrival of the delegation in Bucharest was carried by *Radio Peking* on 13 June.

Comment: Official claims by all concerned notwithstanding, there appears to be a definite bias in the activities of Romania in its relations with the Soviet Union and Communist China. This may be due in part to the rather hard line expressed by the Soviet Union in the past, typified by a UPI article dated 8 August 1969 from Bucharest, reporting that the Soviet delegate to the Romanian Communist Party Congress, Konstantin F. Katushev, walked out when a message from Communist China was read congratulating Romania on success in its “defense of national independence.” Katushev later returned to the meeting and reportedly

warned that the Soviet Communist Party would use "any effort" to counter excessive independence or disunity within socialist ranks.

Resentment of such an attitude, encouraged by Soviet actions in Czechoslovakia and the no doubt gentle arguments of the Chinese Communist representatives in Bucharest and Peking, may have contributed to the two-year delay in the renewal of a treaty of friendship between the Soviet Union and Romania. The initial friendship treaty was signed in 1948 for a period of 20 years with a provision for renewal. At the present time, according to a *Japan Times* article dated 14 June, Leonid I. Brezhnev is planning to travel to Bucharest in early July to sign the treaty.

In the meanwhile, an extended and enlarged trade pact with Communist China has been in effect for almost three months, and the Chinese have contributed a reported 50,000,000 yuan (\$20,000,000) for flood relief in Romania. Communist China's concern for Romania, its repeated praise of Romania's "defense of its national independence," and the assurances that China would support Romania in maintaining its freedom of action, tend to indicate a closer relationship than has previously been the case.

Although it is a bit early to say, it is not impossible that Chinese-Romanian relations may develop to the point that the Soviet Union may fear the establishment of another "Albanian situation." Additionally, the stated position of Romania that it would fight if Soviet troops crossed its borders would lead one to suspect that Romania was counting on something more than world opinion to discourage such adventurous moves by the Soviet Union.

Finally, the presence of Yuang Ung-sheng, Chief of the General Staff of the People's Liberation Army, at the 9 June meeting between Chou En-lai, Kang Sheng, Li Hsien-nien, and Emil Bodnares and other unspecified members of the Romanian delegation at least opens the possibility of some type of Communist Chinese military aid or assistance agreement being offered to, if not yet accepted by, the Romanians.

Continued observation of relations between Romania, the Soviet Union and Communist China may disclose another "Albania," albeit a more independent one, in the making.

VOICE OF THE PEOPLE OF BURMA*

By the 7th PSYOP GROUP

Analysis of Burmese antigovernment clandestine radio provided an indication of the objectives and tactics of the radio's sponsors.

The *Voice of the People of Burma* (VPB) (clandestine) continued to berate the Ne Win military government. For the week of 12-17 December 1971 the station held true to its policy of repeating its programs over a two day period. All was transmitted in Burmese. Reception was poor.

*Excerpts from "Communist Propaganda Highlights, Trends and Analysis," Issue No. 51-71, December 1971, pp. 51-15-51-16.

The first item on 12 December 1971 dealt with the Burmese Communist Party (BCP) policy on the treatment and education of prisoners of war. *VPB* stated there were five basic principles followed in the treatment of captured Burmese soldiers. This lasted nine minutes. The Ne Win clique was criticized in San Yu's speech on defense expenditures and dependence on imperialists to build Burma's industries. Another program entitled "Military Clique Which Is Stepping Up Military Expenditures to Depend More on Imperialists and to Oppose the People" lasted for nine minutes. Another program, "Talk on Austerity Exposes Dogfight" lasted 7.5 minutes and stated that the military clique is corrupting itself from within at high levels by squandering the country's money. Lasting six minutes, the last program, "Who Suffers from a System of Providing Raw Materials and Procuring Finished Products?" dealt with the Government's poor system of distribution of finished products. Eleven minutes of victory news from Cambodia and Vietnam closed out the broadcasts. The program for 12 December 1971 was repeated on 14 December 1971.

On 16 December 1971, the broadcast opened with "Combat News" for 3.5 minutes. The first item, "Dogfight Within Ne Win's Military Clique," was a repeat of the topic of 12 December 1971. For 5.5 minutes, it treated the corruption of high level officials and predicted more political fights and power struggles. A seven-minute program, "Ne Win's Economic Plan Will End Up Like the Welfare State Plan" followed. Calling on the people facing housing problems to fight together, "Beware of the Dangers of Military Government, Rangoon Hut Dwellers" lasted 5.5 minutes. "The Growing Struggle of the Thai People against the US and Its Followers—The Thanom-Praphat Clique" continued the broadcast for four minutes. The usual Marxism-Leninism and Mao Tse-tung Thought program closed the broadcast period. The foregoing lasted 18 minutes and presented quotations from Lenin's teaching on the dictatorship of the proletariat. This program was repeated on 17 December 1971.

Comment. During this period *VPB* was stressing governmental graft and corruption. The attack is aimed at high level officials who are said to squander the Government's money on luxurious office equipment while preaching austerity to the people. This line may create more distrust and unrest among Burmese because many are discouraged by Burma's lack of progress. Nothing is known of the *VPB* audience. If only Communists listen, they are probably convinced already that Burma's only solution is Communism. *VPB* programs then serve to reaffirm the conviction. Whether the corruption charge is true or false in Burma is not really important. People in Burma, patient though they be, know that progress is minimal. To blame some of this on corruption is a way of saying that Communism is needed and is not corrupt. *VPB*, as usual, reports the strides forward in other nation's people's wars. There is no reason, *VPB* implies, that such progress will not occur in Burma, too.

VIEWS HELD BY NORTH KOREANS ABOUT FOREIGN COUNTRIES AND PEOPLES*

By the 7th PSYOP GROUP

This report gives an example of how intelligence reports can improve the audience information data on which PSYOP targeting is based.

1. UNITED STATES

Source said North Koreans believed that economically, militarily, scientifically, and in material wealth the United States was the most powerful nation in the world. The NK Government did not deny these facts about the US.

Older North Koreans had the opinion that Americans were humane and gentle, and in fact some other North Koreans believed this privately. They believed that the US engaged in international cooperation. But many North Koreans believed that the US had held a constant war aggression policy throughout its 200 year history. They also believe that the US, a mighty nation, was defeated by North Korea during the Korean War, and they are proud of this victory. Moreover, in connection with the Pueblo seizure and the shooting down of the EC 121, some unsophisticated North Koreans firmly believe that the US will never think lightly of the North Koreans. On the other hand, some intelligent North Koreans believe that the US has restrained itself and endured these events in a cautious, prudent way because the US wished to avoid further involvement in Asian wars, since it was already involved in Vietnam.

When many North Koreans think of the US, their first impression is imperialism. North Koreans do not know about the real functioning of the democratic system in the US. Many also believe, because of North Korean propaganda, that Americans outwardly are humane and cooperative toward underdeveloped and small nations, but in actuality are cunning and crafty. North Korean movies and plays portray Americans in this manner.

North Korean propaganda uses the theme that US forces are stationed in Korea (1) to exploit Korea and (2) because the Korean Peninsula is a strategic base for future US expansion on the Asian mainland in concert with the Japanese. Despite this propaganda, some North Koreans reason that US forces are stationed in the ROK to provide active and positive support to the ROK, to help the ROK develop into a more advanced nation, and to protect a friendly nation from the threat of Communism. On the other hand, source observed prior to his departure from NK in

*Excerpts from "Views Held by North Koreans About Foreign Countries and Peoples," PSYOP Intelligence Notes, No. 257, 17 May 1971.

July 1969 that some North Koreans complained about the passive attitude taken by the USSR and Communist China in supporting North Korea. The US has provided visible active support to its friend, the ROK, but Communist China and the USSR have provided only passive support to their friend, North Korea. Some intelligent North Koreans attribute their poor basic living conditions to the passive aid and support given North Korea by the USSR and Communist China.

2. USSR

Source provided some information about the attitudes of North Koreans about the USSR, but it should be noted that this is based upon his experience in NK before his departure for the ROK in July 1969, and therefore attitudes may have changed in some respects.

From the end of the Japanese occupation until the mid-1950s, North Koreans regarded the USSR as a very close and friendly socialist nation, in fact almost worshipping the USSR. However, their attitude toward the Russians changed to one of keeping the Russians at a distance. The reason for this, according to source, was that at first North Koreans greatly admired the Russians because they had come to North Korea as liberators, but this friendship was not based upon a long historical relation, instead upon the momentary assistance of the Russians in liberating Korea from the Japanese and in providing help during the Korean War. However, after the Korean War, when Khrushchev adopted revisionism and peaceful coexistence, North Korean leaders began to draw away from the Russians. The attitude of the North Korean leaders was spread among the people by the North Korean propaganda apparatus.

North Koreans believed that the USSR was the strongest and most powerful of all the socialist nations, but was not as economically powerful as the US. Some had believed that the USSR was the most powerful nation in the world, but they were surprised at Khrushchev's announcement proposing peaceful coexistence, and that Russian productivity would catch up with US. In so doing, Khrushchev admitted that the USSR was behind the US economically. This surprised many North Koreans.

However, in science, especially space science, most North Koreans still believe that the USSR is ahead of the US. The fact that the Russians put the first man in orbit around the earth, ahead of the US, had a terrific effect on this North Korean attitude.

Some North Koreans began to feel uneasy after their dependence on the USSR became less and less, and the USSR followed revisionism and adopted some capitalist concepts. Nowadays, under Kim II-song's concept of *chuche*, North Korea has kept its independence of the USSR, economically, politically, and ideologically.

During the 1950s and even the early 1960s it was the ambition of young students to be able to go to Moscow to study, but now only a limited number of students go. Generally, learning from the Russians has

become less and less attractive, especially since the time Khrushchev adopted peaceful coexistence, his trip to the US, and his humiliation in the Cuban crisis. Now, as far as source knew, there were almost no students from the USSR and the Eastern European satellite nations in North Korea. But there were some students from African nations and North Vietnam studying in North Korea.

North Koreans considered that the Russians were cowardly, selfish, and egotistical.

3. THE PEOPLE'S REPUBLIC OF CHINA

Source provided some information about attitudes of North Koreans toward Communist China and the Communist Chinese, but this information is based upon his experience in North Korea up until he left there in July 1969. Since then based upon current relations between NK and Communist China, attitudes of North Koreans may have changed in some respects.

The first impression that North Koreans formed of the Communist Chinese was that they were "magnanimous" and "generous." Generally, North Koreans, both leaders and ordinary people, regard Mao Thought as the product of the dotage of an old man and the Cultural Revolution as an ultraleftist action. North Koreans, at the time of the Cultural Revolution, felt proud because they believed that only in North Korea was genuine Marxist-Leninist ideology being followed, the Russians having gone to the right, and the Communist Chinese to the ultraleft. North Koreans generally thought that the Cultural Revolution in Communist China brought shame upon the Communist Bloc, and that the Cultural Revolution, which they termed a riot, would stand in the way of the unification of Korea under North Korea. They considered that the cruel acts in the Cultural Revolution against the intelligentsia would stimulate negative reactions to Communism among the intelligentsia in the ROK.

According to source, a large number of people of Korean ethnic origin lived in the northeastern part of Communist China, but during the Cultural Revolution many cadres of Korean ethnic origin were purged. This also was a factor in worsening the attitude of North Koreans toward the Communist Chinese.

Source said that there had been many small incidents during the Cultural Revolution along the Communist Chinese-North Korean border. Once in August 1967, when source was at Hyesan on the Yalu River, he saw such an incident. There was a small island in the river, which, because of floods, was usually submerged. The North Koreans built an embankment from the river bank on their side of the island. As a result of the construction of the embankment, the Chinese Communist side of the river was flooded instead of the North Korean side. The Chinese Communists, to protect their side, built a stone and wood embankment out into the river. Then the North Korean side was flooded. As a result, the

North Koreans built out from the island an embankment of stone and wood jutting out into the river at an angle a little below the Chinese Communist embankment. This directed the flow of the flood back against the Chinese Communist side of the river. Then the Chinese Communists started building another embankment to correct the situation. At this point the North Koreans proposed negotiations with the Communist Chinese. A North Korean high level provincial official was selected to meet with a Communist Chinese representative who was from a low-level organization. The North Koreans, as a result, would not hold negotiations with the Chinese. Source did not know what happened further in the matter.

Source had heard that there were many small incidents provoked intentionally by the Communist Chinese against the North Koreans. Once three or four Communist Chinese soldiers waited in an ambush in a border area until North Korean trucks came by, then they threw stones at them.

On another occasion the Communist Chinese allowed some relatives of North Koreans to cross into North Korea where they actively promoted Mao Thought.

During the period 1963–1965, according to source, the Communist Chinese authorities put economic pressure on the North Koreans by stopping or postponing the regular or periodic shipment of oil, coke, and other materials for which North Korea depended upon Communist China. Such factors worsened relations and the attitude of the North Korean leaders and people toward the Communist Chinese. North Korea did not officially attack Communist China's move toward the ultraleft, but unofficially, anti-Communist Chinese remarks were spread among the North Korean people. Brotherly relations between the North Koreans and Communist Chinese, based upon help from the Communist Chinese during the Korean War, almost disappeared. The first impression the North Koreans had of the Communist Chinese as magnanimous and generous was replaced by feelings that they were foolish, stupid, and stubborn.

In the case of an emergency, such as an attack from the ROK, the North Koreans expected that they would receive manpower support from Communist China, with material, modern military equipment, coming from the USSR.

The Communist Chinese, source believed, thought badly of the North Koreans for their great idolization of Kim Il-sung. Source said that in March 1968, when he was in the Pyongyang Grand Theater where there was a drama being put on by the North Korean Army, he saw the Communist Chinese diplomats display a bad attitude in welcoming Kim Il-sung. There were a large number of foreign diplomats present, including the Communist Chinese. The area in the center of the front rows of the theater was occupied by the foreign diplomats. A large portrait of Kim Il-sung was hanging at the back of the stage, and at the beginning of the affair as was the custom in North Korea, a choral group sang "The

Song of Kim II-song." When Kim II-song came to deliver a speech or when "The Song of Kim II-song" was sung, it was the custom for everyone to applaud. At the time source was at the Pyongyang Grand Theater, when "The Song of Kim II-song" was sung, everyone in the theater stood up during the song and applauded when it was finished, except for the three Communist Chinese representatives.

Unpublished Studies

ATTITUDES, COMMUNICATIONS AND COMMUNIST PROP-
AGANDA:
FACTORS IN INSURGENCY IN SOUTHEAST ASIA*

By the U.S. INFORMATION AGENCY

This report illustrates how an unpublished study, bringing together a number of communication findings, can constitute a compact sourcebook of PSYOP-related intelligence for field personnel, even though the report was prepared for other purposes.

ROLE OF PUBLIC OPINION

Small increases in literacy and education, improved communication facilities and urbanization in the Far East have been responsible for a slow expansion of the base of public opinion. Young army officers, professionals, students, religious leaders, businessmen and trade union leaders all seek a voice in their future. Alien and competing foreign influences often reinforce these national groups, which are beginning to understand the nature of their influence and attempt to exert it more freely. Successful expression of opinion and influence is still sporadic, however, and suffers from official efforts to censor and repress in many countries.

Some of these primarily urbanized groups have begun to serve also as links back to the predominantly rural, more traditionally oriented sectors of their communities. They thus help to change the outlook and orientation of the rural masses. Often they interpret and communicate government policy and opinion to the masses, and are becoming increasingly influential opinion molders, creating as well as interpreting mass opinion for the government. These new groups represent a new type of nationalism; pragmatic but with a touch of idealism; cosmopolitan, but without a loss of patriotism; modern, yet somewhat tolerant of tradition. They are more interested in action and results than in the dogma and ideology of their elders. For them, integrity and competence count more than the traditional values based on kinship, status or wealth, and their actions indicate their anxiety to improve matters.

* * * * *

In general, where accommodation is made to the surge of opinion and change, transition can be orderly and peaceful; where opinion is suppres-

*Excerpts from "Attitudes, Communications and Communist Propaganda: Factors in Insurgency in Southeast Asia—1962, "R-76-62 (A), U.S. Information Agency, 1962, pp. 1-29.

sed or ignored, events are more likely to produce violence or upheaval. . . . In Japan [during 1961, for example], public opinion showed a more mature and responsible face. While the mechanisms for the expression of public opinion were relatively unchanged, evidence suggests that mass media, organized pressure groups, political parties and various front groups were forced to become more aware of and responsive to public opinion favoring moderation. This desire for moderation and public order was galvanized into forceful expression by the excesses of the 1960 anti-security treaty struggle.

The Japanese example provides a classic observation on the impact of opinion. When such crystallization of opinion takes place, all institutions must pay attention to closing the gap between popular sentiment and performance of the media, parties, etc. Only when opinion is in the process of formation, or when it is not held strongly, can the media or parties pursue an active course seeking to control and mold public opinion. Once opinion has crystallized, media and political leaders ignore it only at their peril.

BASIC FACTORS INFLUENCING OPINION

. . . Several environmental factors produce unique or special problems in all nations of the Far East and basically influence the general orientation of opinion. These include: The aftermath of colonialism during which most Southeast Asian nations are attempting to recover from the painful distortion of traditions resulting from automatic imitation of the West without adequate adaptation; demands of urban elites for rapid modernization of the economy; right wing resistance to reform; peasant pressures to secure social justice and agricultural reforms; attempts to form adequate administrations and the inability of some governments to exercise authority as in South Viet-Nam, Indonesia, Laos and Burma; internal warfare and subversion as in Laos, Thailand, South Viet-Nam; separatist movements and problems of national unity in Indonesia and Burma which weaken the central government and aid the Communists; ethnic and racial disputes as in Burma, Malaya, Singapore and Laos; outbursts of nationalist extremism as in Indonesia; regional antagonisms like that of the triangular struggle between Thailand, Cambodia and South Viet-Nam; tensions of the divided countries of Korea, Viet-Nam and Laos; contiguity of several Southeast Asian nations to Communist China and North Viet-Nam.

REGIONAL AND LOCAL ISSUES

Local and regional issues dominate the thinking of most Asians, whether they be political or "trained" elites, laborers or peasants. A brief listing of the prevailing regional and local concerns would include: (1) social change and dislocation caused by modernization, (2) economic orientation, (3) regionalism, (4) Communist threats, (5) separatist movements and problems of national unity and (6) tensions of divided countries and problems of guerrilla warfare.

It would be difficult to over-emphasize the problems and difficulties attendant on modernization and national development in the Far East. Demands for modernization are strong among urban elites, but weak from the primarily unreceptive rural sectors. Peasants prefer to secure social justice and agricultural reforms with few resultant changes in their traditional way of life. Yet, political leaders have over-extended themselves through efforts to modernize their country too rapidly. Some of them, however, like U Nu and Sihanouk, have realized that traditional mores also must be maintained and adapted to the times if stability is to be assured.

Meanwhile, the process of modernization has progressed enough to add new strains to the old as traditional and modern groups clash. Radical changes have produced expectant new social groups, plans without managers, factories without technicians and university graduates without jobs.

* * * * *

COMMUNICATION PATTERN

With the exception of Japan and the urban centers of the Far East, the communication pattern is far from adequate for the nations' needs. A low level of information is characteristic for all sectors except the small urban elites. The press remains limited largely to urban distribution and radio receivers are too few and not widely dispersed. Most information is still transmitted through informal channels. Mass media serve to feed an increasing amount of information into informal channels.

...Consequently, the effective utilization of the village council is of considerable importance to leadership as a source of feedback and as a mold of peasant opinion on the government's authority and programs. District leaders and provincial governors share an important role as a feedback source to the leadership and as molders of opinion.

With the exception of Japan, and possibly Malaya and the Philippines, the general communication process providing for a dialogue between decision makers and the public is best characterized as a "semi-closed" one; the public generally cannot express itself by pressure or representative strikes or press campaigns or non-manipulated elections. Yet street demonstrations—albeit ones often organized by political parties for their own benefit, expressions of opinion in the press and intellectual quarterlies and party conferences and conventions, serve to keep the communication process partially open.

* * * * *

ATTITUDES

National Development, Economic and Technical Aid

In most of the Far East, expectations of social reform and desires for economic modernization exist among Westernized, urbanized elites. The

peasant masses seek land reform, agricultural credit and simple but modern tools, yet cling to the traditional values and social customs.

While the new governments find it difficult to administer even the most basic national functions, they encounter still greater difficulties when they try to initiate change. Efforts to carry out planned economic development become especially burdensome when communication facilities are inadequate and few competent administrators and technicians exist. Since accomplishment lags far behind promise, national discontent is intensified.

Yet "modernization" is an important political issue and a rallying point for intellectual leaders and modern elements of the new states. These are also the most active political elements who can make the issue of modernization a source of unrest, discontent and turmoil in the area.

The new nationalists are seeking ideological and cultural identity, a workable political and economic system, and determined, strong leaders. Their inward search for a national character leads them to probe for a synthesis of traditional and modern ideas. Since national unity is one of the most serious problems confronting these countries, the role of the military as an agent of nationalism in South Korea, South Viet-Nam, Burma, Thailand and Indonesia, cannot be overlooked. Military organizations, which often stage coups for nationalist reasons, have the discipline, talent, *esprit de corps* and coercive means to reorganize and operate their country more effectively than the diffuse bureaucracies. Yet military rule often creates political tension and an atmosphere more favorable to the growth of communism than democracy.

[International Issues]

There is a massive disinterest, even by Asian elites, in most international issues which do not directly impinge on their interests. The burning struggle in the world for them is not the Berlin crisis or even the ideological struggle between communism and democracy, but rather the development of their own new nations. They say so, quite vigorously.

* * * * *

TARGET GROUPS

The following sections will discuss the various groups involved in change. The groups are discussed, for convenience, under the usual three major categories. The categories should be considered flexible, however, for the early stage of modernization and change has not yet produced definitive patterns and roles.

General Populace. This numerically preponderant group is generally inarticulate but capable of becoming a strong force if stirred by their leaders. It includes peasants, ethnic minorities, army enlisted men, and unskilled laborers. The great size of these masses contrasts sharply with the small number of elite who control the society.

Middle Class. This is an expanding group, containing articulate political forces, and one where the distinction between "westernized" and

"traditional" is more strikingly apparent. It includes professionals, the religious hierarchy, educators, students, communicators, civil servants, junior army officers, labor leaders and a growing group of businessmen.

Elite This includes top government officials, senior army officers and the monarchy.

Voluntary Associations and Interest Groups. A fourth category might deal with combinations of these population elements into voluntary associations and interest groups.

General Populace

Peasants. They comprise the bulk of Southeast Asian society and are often least receptive to change because of their lack of education, fears of the supernatural, devotion to religious principles and tradition. Although they are not directly involved in the structure of power or the process of government, their support is necessary for those in power. Thus, indirectly, they influence the government. Although the peasants are largely unorganized, cooperatives are gaining popularity and politicians—especially the Communists—are attempting to organize them. Among the peasantry, the village headman either because of his age, education or respectability, is given high credence and serves as a source of news and advice for the peasants.

Labor. A major problem for this group is created by the frequently abrupt transition many workers make from a more or less primitive rural subsistence economy to a technologically more advanced urban economy. Governments in the area are attempting to help them adjust to the requirements of an industrialized life in order to prevent them from becoming dissatisfied and a prey to opposition leaders. Labor, particularly plantation, dock and mine workers, has been a prime target for Communist infiltration tactics.

Urban Proletariat. This urban, unskilled labor group, separate from the urban industrial labor force, includes, for example, street vendors and pedi-cab drivers, who have become socially mobile and are beginning to respond to and participate in political parties and small pressure groups. This group—breaking away from traditional social controls—has suffered personal maladjustment and disorganization; juvenile delinquency and unemployment frequently plague this group. As their desire for education and advancement increases along with their discontent, they will become increasingly important as a target for mass communicators, politicians and others competing for their support.

* * * * *

Army Enlisted Men. The enlisted men come from the lower classes and have little chance for education, exert little influence and are more susceptible to blandishments from any side which can offer them a better life. They are important because they have roots in the local community and often carry information to it.

Ethnic Minorities. The number of indigenous tribal minority groups in Southeast Asia created by physical conditions and differences of race,

attitudes, beliefs, and language, is estimated in the hundreds. Sharply differentiated from one another, these tribal groups who generally live in a semi-savage state have in common a fierce pride in their own organizations and cultural patterns and an intense fear of being swallowed up by the alien culture of the majority. These do not include alien minorities such as the Chinese or Indians.

Although often small in number, the individual minority groups when combined account for a fairly large segment of the area population. They constitute elements in the society which are highly susceptible to dissident and subversive activities. If well organized and directed, these minority groups could exert considerable influence.

* * * * *

Women. With increasing urbanization and improved education and organizational consciousness, women are assuming more active roles. Their influence is generally projected through women's organizations, but they are also important in some business circles and in education. Limited surveys to date show that women are a substantial and distinct target audience. It would be most difficult to reach both men and women of the non-elite group with a single program or magazine. Radio listening, which permits women to have contact with the outside world while performing their household duties, appears to be a major source of information for women who own sets.

Middle-Level Groups

Mass Communicators. Because of the relative lack of effective political opposition groups, civic and special interest associations or pressures from academic personnel or professional classes, newspaper editors and others in mass media work must carry the heavy burden of responsible instruction of public opinion.

Often, however, the government itself employs many of the nation's best publicists, and their consequent removal from journalistic action leaves the field open to less responsible, less educated journalists. In addition, the low status of journalists, in comparison with those into whose public conduct they would inquire, tends to hamper the press. Many reporters are critical of those they consider "politicians" but often their criticism is tempered by the relationship of the newspaper publisher or editor to a particular party or politician. The editorialists find it easier to write about Western foreign policies and problems than the current problems of their own societies; however, this does not mean that foreign news coverage is heavier than domestic coverage. There are exceptions, of course, and as the number of educated editors in Southeast Asia increases, they will be most influential in understanding and helping to advance modernization.

Religious Leaders. (Buddhist) Buddhist monks provide the largest number of public-opinion molders in Burma, Laos, Thailand, Cambodia, and to a lesser extent, South Viet-Nam. The members of the *Sangha* (order of monks) belong to individual monasteries and sects but have a cohesive organization. The chief monk or abbot—head of the

local *wat* (pagoda)—possesses high prestige within the community, is a source of influence and information and is one of the few members of the village community (outside of the teachers) who reads newspapers and is a transmitter of new ideas.

Buddhist monks now receive training in state schools and indoctrination in secular thoughts and methods. Because of increasing social and political consciousness, the monks are attempting to keep abreast of modern learning and methods.

In addition to the role of the *Sangha*, powerful Buddhist societies of laymen, such as the *Sasana* council in Burma, play an important role as informal pressure groups. Although theoretically aloof from secular affairs, there is ample evidence in recent history to indicate that these groups respond dynamically to important issues such as the threat of local Communists to the Buddhist religion and the Communist threat to Buddhism in Tibet.

(*Islamic*) In the Muslim country of Indonesia, where religion is inextricably interwoven with politics, the role of the *ulema* (Muslim scholar and teacher) is not as influential as the monk in the Buddhist world. Ulemas are apparently more influential in the outer islands, where there are greater manifestations of devotion to religion, than in Java where political affiliations are as important as religious ones. The *ulemas* are frequently highly nationalistic and make their influence felt through the political party, the *Nahadatul Ulama*.

Divisions within Islam occur along two prominent lines. There is the social cleavage in Java between the communities of the *Santri* the devoutly Muslim persons often associated with town or village trade, and the communities of the intelligentsia or middle class of the cities and large towns who are nominally Muslim but accept most of the cultural content of Western civilization and are more receptive to change. A second type of cleavage has developed inside the Muslim *Santri* between modernism and religious reform as expressed by the urban small traders and the orthodox Masjumi Party. Such cleavages condition attitudes toward change and make different communications approaches necessary.

(*Catholic*) In the predominantly Catholic Philippines, the priests are very influential and the Church is a dominant force second only to political parties. In South Viet-Nam, although Catholics form only ten percent of the population, there is a large percentage of Catholics in high government positions.

Labor Leaders. They tend to be middle-class intellectuals strongly favoring economic development and change. They are becoming influential because of their affiliation with political parties and the support they can deliver by virtue of their control of mass organizations. Many have simply chosen the unions as an additional stepping-stone to power, prestige or just to provide a higher standard of living.

Junior Army Officers. Junior army officers, together with university

students, serve as major communication channels between Western influence and their own culture. Both junior and senior army officers have the added advantage of being well disciplined with both administrative capacity and responsibility. This demonstrated capacity is the more remarkable in a situation where decision-making by deliberation and compromise is neither customarily applied nor effective.

* * * * *

Middle-echelon officers are trained primarily in their own countries and act as mediators between the top and lower levels. Often they are closer to the rural and urban middle classes and are influential in bringing about change.

In Burma, South Viet-Nam, Malaya, Laos, and the Philippines, middle-level army officers and the rank-and-file are coming into closer contact with the masses through civic action committees, or National Solidarity Councils (Burma) through which they attempt to curb insurgency, fight the Communists and at the same time promote citizenship and greater loyalty to the state. Through these activities, they gain greater status and authority and also become a more effective channel for information.

The development of a traditional, professional corps and the establishment of defense colleges and economic institutions—that is, National Defense College and Defense Services Institute of Burma—indicate an increasingly persuasive and possibly intellectual role for the Army. Certainly the Army can be expected to exert a far greater influence in civilian affairs than ever before.

Most decisive of all, will be the extent to which military leaders are able to broaden their own education so as to see their country in perspective and cope more effectively with the innumerable problems confronting their countries.

Small Businessmen. The economic and social “underdevelopment” of Southeast Asian countries is often reflected in the small size and structure of the middle class. The entrepreneurial classes tend to be more mercantile and financial, and these are not the fields in which economic progress is sought. Although there are numerous small retail traders, they are largely illiterate and have assimilated little modern culture. Government restrictions on foreign businessmen are gradually propelling indigenous groups to participate in the economic life of their countries. As they grow, so may their influence.

Overseas Chinese now control most of the trade in Southeast Asian countries, and although assimilation is taking place, they are likely to preserve a separate cultural identity for several more generations. Restrictive measures now being applied to Overseas Chinese in several countries are intended to offer new opportunities to indigenous businessmen, but these measures may cause more Overseas/Chinese to look toward Peking for support.

University Students. Students are among the foremost progenitors of change, the first to become disenchanted with the slowness of economic

and social progress and the first to revolt against tradition. The inadequate opportunities open to them after graduation may lead, and in some cases have already led, them to agitate for rapid change and to cooperate with groups advocating the overthrow of incumbent governments.

In Burma, Indonesia and Malaya, especially, student organizations have grown strong and are militantly anti-colonialist and nationalistic. Communist elements everywhere are ready to take advantage of and attempt to infiltrate these groups. For these reasons, ruling elites regard student groups as unruly, fear their power, question their political abilities and are currently making efforts either to silence them or appease them.

* * * * *

Teachers and University Professors. Teachers throughout the rural areas of Southeast Asia traditionally hold a respected place in society and are important opinion leaders. In rural areas they are often the only newspaper readers and source of news and opinion. But in urban areas the traditional respect for teachers is being gradually transferred to political leaders. In Burma, Indonesia, the Philippines and Malaya, teachers' unions are taking on the character of trade unions as they seek greater benefits for their members and try to promote better citizenship. Their cohesiveness and organization are not great, however, despite highly centralized educational systems.

University professors, many of whom are Western educated, ordinarily are not the leaders of the intelligentsia; government control of the universities often hampers the exercise of leadership and professors generally lack any power to alter the situation.

The major area of effectiveness of this group is as a channel of communication and influence for the intelligentsia and the students. But the wide gulf that exists between faculty and students—based on traditional deference to persons in authority—restricts their effectiveness and makes it only formal one-way communication. The influence of this group is thus based more on prestige than on power or action.

Elite-Level Groups

Intellectuals and Administrators. This important group's attitudes differ substantially from the general national attitudes with respect to goals and values, principally because of their Western training. They believe in the truth of science and in its application: the value of rational administration, written laws and orders, achievement and professionalism. Gradually they are beginning to place less emphasis upon religious and family affiliation, and believe more in progress, and, to a limited extent, planning on a long-term basis. They are somewhat delocalized, albeit less completely than they themselves think. The cleavage between them and the rest of the population is often apparent; their problem a universal one.

These intellectuals—though usually employed in the government

—are often distrusted by the politicians, who, although often intellectuals themselves, are more populist and even demagogic. Criticism by political leaders has appeared to weaken the position of the intellectuals, making them less prone to oppose the often unrealistic aspirations of their political superiors. For all these reasons, effective criticism by these groups within the government is insufficient and ineffective.

Those intellectuals remaining outside the government often express themselves through organizations which could contribute to improvement of the quality of public opinion, providing as they do a vague, unorganized opposition to government. But for the most part, the intellectuals remain alienated from the centers of public life. They are disillusioned and unhappy about the course of events, including the government's inability to utilize their talents.

Intellectuals and Specialists: A new sector of the intellectual class is beginning to develop with chemists, engineers, accountants, statisticians, doctors, and lawyers forming the nucleus. This sector is more specialized and professional and less generally interested in cultural and political matters. It could, however, form the basis for future stable and progressive societies. Though small in number, the high prestige of these people, especially in the cities, enables them to influence acquaintances, clients and others outside of their professions. Nevertheless, they usually lack direct political influence and a popular following.

Overseas Chinese form a significant part of these intellectual groups only in Singapore and Malaya, where educated Chinese outnumber educated Malays. Elsewhere, in Southeast Asia, however, the professional classes include only a few Chinese members. In addition to the frustrations affecting other intellectuals, the Overseas Chinese intellectuals tend to be susceptible to the appeal of association with the mainland and fear discrimination because of their alien origin.

Upper-Rank Military Officers. Most of the upper-rank military officers are young men strongly desirous of technological improvements within the society. At present, many senior officers have been Western-trained either in the West or by Western methods; many have received a technical education in engineering colleges and are thus more favorably disposed toward Western life. If the Army itself is not in power, senior army officers often maintain close contact with the ruling elite.

Voluntary Associations and Interest Groups

There is a growing body of private and voluntary associations and interest groups whose influence will undoubtedly increase in the future. Although few in number at present, trade union and employers associations, professional and business associations, and welfare organizations perform significant functions on behalf of their members, including providing regulations for those within the association or

negotiating and bargaining with each other. Until recently, the family or village circle played this role and provided for such needs. Both the Philippines and Indonesia have a large number of such associations; their numbers are growing in Burma, South Viet-Nam and Malaya. In Thailand, Cambodia and Laos, individualism and ideas of personal responsibility make associations less popular.

These associations often are subject to governmental interference and political influence, but they constitute at best an extra arena for the practice of democracy and group responsibility outside the official life of the country.

VALUES

The transitional societies of Southeast Asia, contending with the disruptions accompanying modernization, appear simultaneously confounded, dismayed and enlightened by the changes occurring in their societies. As they become caught in the economic and social tide inseparable from the age of technology, many people undergoing urbanization remain uprooted and divorced from their traditional cultures and values, without acquiring adequate substitutes.

Practically all of the Southeast Asian nations are culturally and ethnically heterogeneous, traditional values strongly centered in religious orthodoxy are powerful among them, belief in the efficacy of supernatural forces is common, xenophobia is characteristic, kinship and stratification promote particularistic loyalties, lack of technological skills and illiteracy prevail and internal communications remain inadequate. Nearly all these nations confront a preponderant peasant majority, which, if it is not apathetic and withdrawn into its parochial life, is quietly or actively resistant to efforts to modernize it.

In efforts to bridge the gap between traditionalism and modernity, the influence of "modernizing" indigenous elites and interested Westerners appears most successful if it includes an appeal to the more deep-lying values which are part of a country's patterns. New norms are most likely to be acceptable when they are carefully designed to harmonize with selected traditional values. Successful change can occur within the society when types of resistance are recognized and understood, when technological innovations bring with them products valued in the culture, when innovations are carefully planned and when the elite and rising middle class work closely together.

Principal elements of Asian cultures and values will be examined in order to determine their importance in Southeast Asia and to weigh their resistance or adaptability to change. These principal values include moral, spiritual and religious; those relating to knowledge and education; social status and the family; attitudes toward authority, obedience and cooperation; and economic factors including attitudes toward work and leisure.

Contrary to the basic sense of individual determinism commonly accepted in the West, the Asian lives in a universe determined by the will of God, not man. Throughout the Buddhist-Hindu arc of Asia, there is widespread acceptance that the material world is merely an extension of the "real world" of the spirit and that all striving for material success is but an illusion. Thus, Asians see man's relationship to nature and the universe as pre-determined, which leads to a fatalistic acceptance of life as it is—Asia's law of *Karma*.

Spiritual values dominate the lives of Southeast Asian people: their religion provides a system of morality, a guiding philosophic principle for the sophisticated believer, a source of inspiration for ardent nationalists and meaningful symbols for the religious devotees. Despite acceptance of the formal religions of Buddhism, Hinduism, Christianity, and Islam, animistic beliefs are also dominant among a majority of people in Southeast Asia.

Buddhism. Buddhism is probably the most important unifying cultural force in Southeast Asia. It predominates in every country except Malaya, Indonesia and the Philippines and is an integral part of an eclectic Confucianism in South Viet-Nam. In practice and theory, Buddhism is not necessarily incompatible with or opposed to the development of science and technology. Like Christianity, Buddhism cautions man against undue materialism and insists upon the dominance of spiritual values. Freedom of man is proclaimed to a high degree in Buddhism as the doctrine of individual self-development but is tempered by the doctrine of *Karma*.

Fundamentally Buddhism stresses the rational processes of the individual in attaining salvation by understanding, and above all it stresses the concept of knowledge as a part of this process. Its stress on complete equality of caste, color and creed, its real brotherhood of man and its fundamental anti-materialism discourage selfishness and provide the basis for a social conscience. Unfortunately, in its sojourn among authoritarian governments, these aspects of Buddhism have not always been developed. Because of its tenets, Buddhism has and may continue to be used to support policies of neutralism as a middle path in a changing world.

Buddhism and Change. Buddhism teaches the inevitability of change. Social mobility, either upward or downward, is to be expected, and is made possible through various combinations of religious achievement—merit-gaining, favorable marriage, political success, and, increasingly, secular education. In the Buddhist countries of Thailand, Burma, Cambodia, Laos, and to a limited extent, South Viet-Nam, identification with any form of Buddhism inevitably invests the participant with a high degree of social acceptability and facilitates his achievement of status in society.

Nevertheless, a contradiction appears in Buddhist countries between the acceptance of change and anti-materialist teachings. As more mate-

rial goods become available—particularly in connection with Western aid programs—conflict occurs within society, primarily in the urban centers.

The temporary dominance of *Karma* and anti-materialism often justifies the lack of positive action by Asian administrators, which in turn aids in discouraging mass political participation in economic and social programs. The knowledge that the world is sorrow, that present suffering stems from a previous incarnation, that the only hope of peace of soul is not to improve this world, but to escape from it, are powerful reasons for inactivity, and often for passive acceptance of external phenomena. Disasters are met with relative equanimity because of the conviction that in the next cycle, a fresh start can be made. This frequent attitude of passivity and reliance upon providence often makes it difficult to help Asians help themselves.

Westerners, guided by a sense of responsibility for performance in a limited time, may encounter annoying barriers and setbacks, which are often erroneously attributed to laziness or indifference. Reference to the Buddhist belief in change may help in overcoming local indifference or resistance in such situations.

Leading Buddhists are becoming increasingly aware that traditional concepts must be modified to tolerate certain Western influences. Many Buddhist leaders have recognized that Buddhism must seek accommodations with Western-induced changes if it is to preserve itself and its influence in individual and national affairs.

Islam in Indonesia and Malaya. Religion in Indonesia is an inextricable partner in politics, and proponents of theocratic and secular philosophies vie with one another for favor of the masses. As in Malaya, where Islam is also the dominant religion, many still profess devotion to Islam but are less observant of its rituals.

Indonesian Muslims share something in their common faith, but for most of them, Islam is not the unifying force that it has been in much of the Middle East. In addition, the underlying paganism of the Indonesians gives Islam a different undertone from Islamic practice elsewhere in the world. And regional differences come into play. Thus, although Islam is undoubtedly an influential force in Javanese cultural development, it can best be described as "folk Islam," while an evangelical Islamic purism prevails elsewhere in Indonesia. Although Islam is dominant in Indonesia, it also confronts other religions such as the Hinduism of the Balinese and the Christianity of approximately 2,500,000 Indonesians.

Islam and Change. Islam leaves less room for change than does Buddhism and within Muslim communities there is a stronger desire to maintain a status-oriented society. Life moves from day to day, and Indonesians and Malays alike feel that there is little need to look into the future. Time is not the moving backdrop of action that it is in the West. An indirect and subtle approach to problems is traditionally valued above directness and speed. This is changing among urbanized Malays and Indonesians, yet while socialized planning is becoming a watchword, the concept evidently appeals more than the reality of the approach.

Philippine and Vietnamese Catholicism. Catholicism dominates thinking in the Philippines, is influential among a small minority in South Viet-Nam, and aids in offering the society a purposefulness not often seen elsewhere in Southeast Asia. Significantly, it is the Church which has become the most potent organized political force outside the political parties.

Confucian Vestiges in South Viet-Nam. The existence of an eclectic Confucian doctrine together with Buddhism and Catholicism is important in shaping not only religion but a way of life in South Viet-Nam. Social organization rests on the Confucian doctrine of universal harmony in which heaven, earth and man each have their appointed place and their minutely prescribed relationships with each other. Confucianism stresses individual perfection whereby each, through education, learns to fulfill properly the role necessary to continue universal balance.

As a result, the individual Vietnamese is frequently faced with the impossible dilemma growing out of conflict between his own necessities and values and those values imposed by society. Humanist, individual and Marxist values have been particularly difficult to harmonize with approved Confucian values. His attempt to obey all these conflicting values has helped to earn the Vietnamese a reputation for insincerity.

Attitudes of Youth toward Religion and Morality. Not surprisingly, it is among the younger generation that traditional religious values are being challenged and changed most. Problems of delinquency and declining moral standards of youth are becoming more common throughout the area, particularly in the cities.

Attitudes toward Knowledge and Education. As one of the highest values on the Asian social scale, education is one of the most potent single factors of common concern to the many and varied countries of Southeast Asia. Significantly Southeast Asia and the West differ in their attitudes concerning education. In the former, the value of education rests more on the status and prestige it confers than on the substantive learning which it implies. Education is relatively difficult to obtain and is therefore a necessary qualification for advancement. In Thailand, for example, civil service pay is largely regulated by the number of degrees which an individual holds.

Although education is also considered a means of advancement in the West, it is primarily valued for its substantive content. The spirit of Western intellectualism is little understood in Southeast Asia, while the American tradition of the uneducated "self-made man" is non-existent.

Education in Southeast Asia is increasingly valued as a patriotic duty. This involves not only the pride of nationalism—providing a more deep seated and durable basis for national loyalties—but also a genuine desire to enter a new and better era. The elites are anxious to borrow foreign educational methods primarily to bring their country up to date.

Furthermore, literacy has become the necessary lubricant in the development of modern political machinery throughout the area. Illiteracy

not only closes off valuable channels of communication but, more importantly, perpetuates the immaturity of peoples incapable of grasping the problems and necessities of modernization. Leaders are aware that an illiterate population is easy prey to every pretender offering a glittering promise of a bright tomorrow.

Relationship of Education to Communications. In the capital cities of most Southeast Asian countries, the mass media are an important influence on the educated. In the rural areas, the teacher, in addition to the Buddhist priest or the village headman, assumes a highly significant role as a source of information and knowledge. Teachers are often expected to take an active role in public affairs, serve on committees and act as inspectors at elections. The teachers are very influential in persuading villagers to obey government policies and in introducing Western ideas and products.

SOCIAL VALUES

The Family. The high value placed upon the family and loyalty to the family is an important factor to be understood by any alien group attempting to work with Southeast Asians. Close family ties with the ensuing high rate of social interaction, particularly in the villages, produce intimate communities with little privacy, where news of interest can be spread rapidly via the "rice harp" or "bamboo radio" of word-of-mouth communications.

Apart from work, religious observances and holidays and family observances continue to constitute the main fabric of village life in Asia. This pattern is more enthusiastically observed in the villages than in the cities.

The structure and organization of the family have been and continue to be diverse among Southeast Asian countries. In South Viet-Nam and to a limited extent in Burma, the family is an extended or joint one—including a number of generations and subject to the control of a patriarchal head commanding a strict sense of obligation and duty.

In Indonesia (Javanese family), and Thailand, however, the small conjugal family—parents and unmarried children—is prevalent and considerable latitude in behavior is permitted. In such a system, kin ties are relatively weak, and other factors such as wealth, class, status, age, education, occupation, and religious affiliation draw men together or set them apart. In Indonesia (Sumatra) and Malaya, the neighborhood community (*rukun tetangga*) is a territorial entity which acquires a kinship quality, and the sense of closeness and cultural obligation may be stronger between neighbors than between distant relatives—an important distinction for communicators.

As a result of urbanization, family life in Southeast Asia is changing rapidly. Change may be traced to disruption of the family as a producing economic unit caused by the migration of its members to the city, and by the increasing need to adapt to a monetary as distinguished from a subsistence economy. As the family system breaks down, and becomes less of a focal point, townsmen are disassociating themselves from tradi-

tional patterns and are beginning to respond to political parties, civic action groups and educational committees.

Particularly evident is the tendency for patriarchal authority to diminish, the status of women to be elevated, the high prestige of elders to wane, and increased individualism to characterize the society. This breakdown of informal social controls is manifest in problems of personal maladjustment and disorganization, juvenile delinquency, increased divorces, and in the acute nature of problems with which the changing family is often unable to cope in the urban setting, such as illness, unemployment and old age.

Some changes, however, must be recognized as desirable. These include the reduced despotism of the family head, the improved status of women and greater personal freedom. It becomes increasingly important for Asians to plan to use the new urban institutions such as schools, hospitals, playgrounds and day centers to deal with the problems of the changing family. There is a need to replace the disrupted social controls with such formal controls as police, courts, reformatories, prisons and child-women labor laws. Information on establishing these controls is often lacking and informational materials on how these controls operate in other countries are often sought.

Social Problems. Lack of information and the inability to deal with and recognize the causes of new social problems often lead these countries to single out a scapegoat for their frustrations or to make harsh judgments on foreign societies which have similar problems. American family life and cooperative community action programs are little understood in Asia. Many Asians visiting the United States criticize Americans for lack of closeness, homogeneity and responsibilities to the family. Even knowledgeable Asians criticize the seeming breakdown in authority in many American relationships, including those between parent-child, employer-employee, teacher-student, government-people, and management-labor.

Although delinquency is becoming a problem in Asian cities, due primarily to changes in society, Asian leaders often blame this on the influence of American culture and criticize the United States for its "glaring" delinquency. Many attribute these problems to the fact that women have so much freedom, work and thus spend less time with their families—a problem which Asians also are beginning to face.

Respect for Age. Respect for old age has been a traditional aspect of life in Asia and remains a significant social value. Dependent old people look to their children and grandchildren to support them. Formerly, old people were entitled to complete respect, but today, particularly in urban centers, how much is given varies with the circumstances. Burma is an example of a country which is unusually age-oriented and all social intercourse is governed by the preferential treatment accorded to senior members of a given group.

This respect for old age has application for foreign agencies operating

in Southeast Asia. For example, senior Asian officials accustomed to respect because of their age and status are often insulted when confronted with young persons from a foreign country sent to work with them on an equal basis. And Americans are often criticized by Asians visiting the United States for not paying greater deference to their elders, and for not sharing responsibility for them. To them it appears that old people are unloved and neglected, forced to get jobs and to shift for themselves in loneliness. It is difficult for them to comprehend the social mobility and occupational opportunities which take children away from their parents or the fact that old people often prefer to live an active and independent life after passing their prime.

The Nature of Authority. The predominant tendency in Asia is for authority to be hierarchical. The highly traditional nature of the society places decision-making in the hands of persons who achieved their position largely but not solely through the qualifications of kinship, age, and sex. Thus, whole sections of the population have no share in the exercise of public authority. The chief effect of this hierarchical structure of authority is to generate either excessive submissiveness among the ordinary people or an extremist egalitarianism, by way of reaction against it. The social organizations necessary for the pursuit of private interests and for the exercise of influence are lacking for the most part. Insofar as people are adjusted to this they have little interest in democracy, little concept of their rights as citizens and above all are little inclined, unless there has been a fundamental break with tradition, to speak out their own views and preferences.

Status and Power. People of Southeast Asian countries attach great importance to status and power both in social and political life. Considerations of status and power permeate human relationships, adherence to Buddhism notwithstanding. Southeast Asians define any social and political situation by the relative status and power involved, and then establish their relationship to it on the basis of these elements.

Class and status consciousness predominate in urban areas; in rural areas less emphasis is placed upon status, although respect for authority remains high. In the cities, many urbanites adopt Western material values to accrue status and thus climb the social ladder. This may contradict Buddhist tenets denying material gains, but urban elites often justify their conduct on the basis of gaining "merit" by rising in the social order. In rural areas, however, status comes more from the maintenance of spiritual tenets and morality than from material advance.

Social mobility is common in Burma, which lacks a well-defined class structure. This has bred social insecurity or *ahnade*. Many Burmans seek power to gain security from controversy and criticism.

In countries such as Cambodia, Laos, South Viet-Nam, Thailand, Indonesia, and to a limited extent, the Philippines, where there is little social mobility, the prerequisites for status are wealth, family, background, formal rank and office.

Practically applied, status-consciousness affects the entire question of

regionalism within Southeast Asia and makes cooperation difficult because elites of the various countries often consider their own nation eminently superior to that of their neighbors.

* * * * *

Cooperation and Consultation. Cooperation and consultation are strongly linked with familial respect and play an important part in the thinking of many Southeast Asians, especially the decision-makers. Often the desire for consultation and cooperation stems from the efforts of leaders to "save face," to prevent error and to avoid ridicule and criticism. But it must also be considered as part of the religious and kinship systems of the countries.

In Indonesia, great importance is attached to cooperation, consultation, avoidance of disharmony, and decision based on general agreement. These concepts operate principally in the communally-centered Javanese society and contrast sharply with the more individualistic areas in the outlying islands. *Gotong rojong*, the pattern of mutual aid, is a central theme in Javanese social life. It is institutionalized in almost every aspect of village life. . . .

Attitudes toward Work and Leisure. Hard work, diligence, perseverance and punctuality are doubtful values in Southeast Asia; one does not work except if one must. Frequently, religious values related to passivity and reliance on providence condition these attitudes. Many Asians can and will work hard by any standards, but only for foreseeable ends. Work is not valued as an end in itself, and the Western idea that one should be ashamed of idleness is not found in Asia.

Leisure, especially in rural areas, comes from seasonal variations in work output. Leisure as well as work may be pursued for relatively long periods of time. Thus, individuals, and sometimes the whole country, may be given to what a Western observer would describe as veritable orgies of work and entertainment.

Gradually, ideas of leisure are changing, especially for younger people in the cities. As new forms of recreation replace old ones, adjustments on the part of all segments of the society are necessary before fear and criticism of the effects of new forms can be dispelled.

Cultural Values. As these countries attempt to seek a *modus vivendi* with Western cultural values and attitudes, concurrent pride in their indigenous traditional art, music, sculpture and religious philosophies remains a dominant factor. Some intellectuals and the political elite, often xenophobic and nationalistic because of their struggle for independence, consider the introduction of alien culture a disruptive influence. Criticism of what they consider the "debasing" features of American culture manifests itself as in the "anti-yellow-culture campaigns" of Singapore and Indonesia. This approach conflicts with and hinders the development of outlook and knowledge necessary for a "modernizing" society. A fusion of the best of Western and Asian forms might be a desirable compromise; so far, however, both have blossomed in separate or conflicting existences.

PSYOP Intelligence Methods

Although there are many methods used to collect and analyze intelligence, only five of the most important are illustrated in this section: intuition, direct observation, interviewing, sampling, and content analysis.

Intuition

The use of intuitive judgments, based on physical evidence of some form, is sometimes confused with guess work. However, intuitive reasoning in the PSYOP intelligence process should not be undertaken by persons who do not have expertise in the subject. In other words, it is only on the basis of a firm background that one should attempt to extrapolate and produce from such extrapolations guidelines for psychological operations. Intuition is the method of producing intelligence that is least reliable.

Direct Observation

Direct observation is an obvious—but often impractical—method of obtaining intelligence. Observation is highly desirable, but clearly, a trained observer is necessary to obtain optimum benefit from observation possibilities in many situations. Observation need not be by nationals of the intelligence-gathering state. Other friendly or neutral observers can serve the purpose equally well. Indeed, captured or surrendered enemy may have had access to certain PSYOP-relevant information by observation. (See “Interviewing” below.)

Interviewing and Interrogation

As a method of converting information possessed by individuals into usable intelligence, interviews can be a valuable tool. Interviewing can take a number of forms and can be applied to friendly, neutral, and hostile respondents. Interrogation may be considered to be a specialized form of interview.

The structuring of the interview and instrument validation procedure are required in all interview situations, whether PSYOP related or not. These are the major problems of interviewing as an intelligence assimilation technique. Another problem associated with the use of interviews is language. Translation of questions or questionnaires can be a very difficult procedure.

In the case of captured personnel, the problems of obtaining false intelligence and extracting intelligence from them are both difficult. A reasonable assessment of the reliability of the source and accuracy of the information gathered must be attempted but cannot always be accomplished. For surrendered personnel, the desire to please the interrogators may influence the content of the information given and therefore an equally stringent assessment of reliability is required.

Sampling

Sampling may be used in conjunction with direct observation, document analysis, or interviewing. It is a demanding procedure, usually undertaken (or at least planned) by extensively trained professionals. An original essay on sampling is included in this section, in an attempt to present a brief, yet comprehensive picture of the major types of samples as well as common problems in sampling.

Content Analysis

Content analysis is a tool that has been refined and sophisticated for sociopolitical research over the years. It is now a powerful means of gathering information relevant to PSYOP. It can reveal the themes, appeals, and target audiences to which the psyoperator is directing his propaganda efforts, and it can also serve as a key indicator of enemy vulnerabilities, as seen by the enemy hierarchy. Content analysis also serves as a basis for counterpropaganda preparation. In spite of the sophistication of which content analysis is capable, it can also provide meaningful analyses without computerized support.

The papers in this section, then, illustrate but a few of the many possible methods of gathering and analyzing materials relevant to PSYOP intelligence needs.

METHODS FOR THE EXPLOITATION OF MAJOR PSYOP INFORMATION SOURCES*

BY PHILLIP P. KATZ

A discussion of the variety of methods available for deriving useful PSYOP-relevant information from a diversity of sources.

This essay will discuss major PSYOP intelligence sources and relate them to PSYOP EEI and the techniques used for gathering data. Figure 1** illustrates the PSYOP intelligence process and program implementation. This section will discuss only the first two elements of the scheme—information source and data collection and testing (method). As Figure 2 indicates, the information source plus the data-gathering technique provide the answers to the EEI for PSYOP intelligence. Both will be discussed. In addition, this section will relate the information source to the PSYOP target, utilization, and the appropriate collecting agency. (See Figure 3).

PSYOP intelligence input data are obtained from published (reference) material and current data sources. Current data are obtained from primary and other sources. Primary information sources are: (1) prisoners of

war, (2) defectors and refugees, (3) the friendly, neutral, and hostile civilian population, and (4) broadcast monitoring. A few of the other sources for PSYOP information are published and unpublished reports, captured documents, including enemy propaganda, newspapers and periodicals, and reports from other sources.

PRIMARY SOURCES

Prisoners of War

U.S. Army or other intelligence agencies are primarily responsible for the interrogation of prisoners of war. Such interrogation for PSYOP purposes requires that the individual interrogator have a reasonable

understanding of the communication process and the manner in which PSYOP media use prisoners in programing. Generally, this understanding of PSYOP media requirements cannot be obtained from a list of questions (EEI). In the PSYOP intelligence questioning some things cannot be asked directly, and it is necessary for the interrogator to understand the use of the information in PSYOP programing and work out his own method for eliciting the desired information accordingly. Most military intelligence interrogators have little or no training in PSYOP, because the primary focus of military intelligence as a collecting agency is on the conventional combat threat. EEI for military intelligence are primarily concerned with number and disposition of troops, types and location of weapons, enemy supply and logistics information, enemy morale, and order of battle.

Interrogation for PSYOP cannot be adequately accomplished mechanically; it requires human and empathic consideration. For example, in one instance in Vietnam, an NVA prisoner being interrogated at JUSPAO complained that he could not cooperate because he had severe headaches. He was give a medical examination and eyeglasses were prescribed. Subsequently, he became a lucrative source of information for PSYOP programs.

If meaningful PSYOP intelligence data are to be obtained from prisoners of war, more is needed than the aforementioned EEI checklist. The history of PSYOP since World War II clearly reveals that information has to be gathered chiefly by PSYOP interrogators who live in the prisoner-of-war camps or detention centers. For example, in Europe during World War II, the intelligence section of the Psychological Warfare Division (PWD) of the Supreme Headquarters Allied Expeditionary Force (SHAEF) had operational control of PSYOP prisoner-of-war interrogators and document analysts who were deployed in the field with the army groups and field armies. Moreover, soon after D-Day (the invasion of Europe), special teams of PSYOP interrogators, operating directly under SHAEF PSYOP, conducted objective interrogations of prisoners for the purpose of studying the morale of enemy forces with a view to projecting trends in morale.

As far as can be determined, no specific format or EEI have been developed for PSYOP interrogation of prisoners or civilians in an insurgency environment. A suggested format for PSYOP interrogation of prisoners of war is the "Dicks-Shils Questionnaire #3 which was the basic interrogation form used by PWD/SHAEF interrogators during World War II.¹ It employs, in part, the open-ended interview technique and is mostly concerned with tactical PSYOP. It is apparent that PSYOP interrogations for an insurgency environment require a different perspective and emphasis; and that a questionnaire developed in 1944 for World War II requires some change.

For the most part, PSYOP research during the Korean War concentrated on the use of interrogations and prisoner panels for testing leaflets.

These studies were limited largely to one PSYOP communication medium (leaflets), and to one audience (the enemy military). The research was not done in close proximity to the operator and results were nearly always made available too late to be useful.

For PSYOP intelligence analysis to be of significant value it is important that research findings be integrated into an operational complex. Otherwise the data collected are usually only of historical interest. As far as can be determined, no PSYOP information system or significant doctrinal guidance resulted from the Korean PSYOP studies.

Open-ended interrogation techniques, which allowed maximum freedom for respondents to describe the situation in which they found themselves prior to surrender, were used in Korea. Such interrogations yield large amounts of varied information, the analysis of which requires particular care. Specific PSYOP questions used in the open-ended interrogations late in the Korean War in the study of Chinese and North Korean prisoners are intermixed and deal with motivation patterns, PSYOP vulnerabilities, communication patterns, and the effect of PSYOP leaflets. It is interesting to note that the interrogations were conducted by Korean civilians employed locally who operated under the supervision of American civilian researchers, mostly professional psychologists.

A necessary and important consideration with regard to exploitation of prisoners of war for PSYOP purposes is the international treaty provisions concerning the questioning and treatment of prisoners of war. The 1949 Geneva conventions for the protection of war victims have been ratified by the United States and came into force on February 2, 1956. They state:

Every prisoner of war, when questioned on the subject, is bound to give only his surname, first names and rank, date of birth and army, regimental, personal or serial number, or failing this, equivalent information.²

Consequently, individual prisoners of war cannot be exploited for PSYOP unless they agree, and their exploitation is in accordance with policy guidance. However, it is important to understand that PSYOP can exploit prisoners of war in many ways: First, individual prisoners may agree to write and be photographed for PSYOP testimonials, preapre audio tapes, or assist in the preparation of PSYOP material (program implementation); second, prisoners may volunteer to provide information on the communication process, significant PSYOP targets, and the effect of PSYOP programs; third, prisoners may agree to cooperate in the testing of PSYOP communications, either individually or as members of a panel. In the first instance, the prisoner would be compromised and could be considered a traitor by his nation. However, as a technique to deter compromise, facial characteristics can be masked or blurred. The other ways of exploiting prisoners of war could be accomplished covertly, with little danger of compromise.

U.S. policy is that individual prisoners should not forcibly be exploited, but the good treatment of prisoners as a group is a PSYOP theme that should be exploited in a vigorous and aggressive manner.

As stated previously, during World War II, Dr. Dicks, the British military psychiatrist, used the technique of the in-depth interview on prisoners of war to construct what he termed the "psychological foundations of the Wehrmacht." This provided valuable insight into the attitudes and motivations of the German soldier. It also served to pinpoint PSYOP vulnerabilities that could be exploited by PSYOP programs (media).

The use of the in-depth interview requires highly qualified professionals; clumsy or aimless in-depth interviewers produce little if anything. This technique requires an officer qualified to use the latest clinical techniques. Moreover, he must have a thorough knowledge of the language and culture involved, and must intimately understand the target audience as a people. For example, William Daugherty writes that:

In the prison camps Dr. Dicks did not disclose his status as a psychiatrist. He was introduced to the respondents as a welfare officer interested in their problems as a prisoner. He interrogated large numbers utilizing a carefully prepared schedule of questions, carried on informal and friendly interviews with many, and kept carefully recorded notes of mass observations. The facts thus gathered were analyzed against the background of such other knowledge available to him concerning the Germans.³

Needless to say, since World War II, the in-depth interview has not been used by the military for the gathering of data from PSYOP sources.

PWD/SHAEF conducted regular attitude surveys in the prisoner-of-war camps. The polls were important in that they provided a quantitative basis for results found qualitatively by individual interrogations. During the Korean War, considerable use was made of prisoner PSYWAR panels to pretest and post-test leaflets especially in the years 1951-1952. In addition, ORO conducted a number of research studies designed to produce a model of a prisoner-of-war panel system and to examine situational and personal factors associated with the act of surrendering. The latter group of interrogations often took place in rear area enclosures weeks after the prisoner had surrendered.

In the Vietnamese War of the 1960s prisoners of war were interrogated at the tactical level for military information. Tactical PSYOP program exploitation, if any, took place at this time. After prisoners were interned at corps POW camps, PSYOP exploitation usually ceased, because of U.S. policy to scrupulously abide by the 1949 Geneva conventions. Consequently, prisoners were seldom used as a source of information or for the preparation of PSYOP programs and messages.

Defectors and Refugees

Defectors and refugees are valuable sources of PSYOP information, especially in an insurgency environment. In Vietnam, Viet Cong or North Vietnamese soldiers who defected under the Chieu Hoi Program were not classified as prisoners; they could be exploited and used to obtain current information about the attitudes and motivation of the Viet Cong, to provide information on PSYOP vulnerabilities, to determine the best communication channels to reach the Viet Cong, to test communication

content, and to appear at mass rallies and in face-to-face communication programs.

Defectors and refugees can also be used as PSYOP writers, illustrators, announcers, and producers of programs. In fact, they can play an active role in all PSYOP programs.

Civilians

Friendly, neutral, and hostile civilians are important sources of information for PSYOP programs, with friendly civilians used extensively to provide information for all communication programs. Three profitable techniques for obtaining PSYOP data from friendly civilians are in-depth interviews, sample surveys, and panel surveys.

In addition to providing information, civilians can play a key part in social organizations and group discussions when they are used as programmed communication channels for PSYOP. Hostile civilians are especially important to PSYOP in an insurgency environment, but have been used infrequently. One of the basic principles for PSYOP-sponsored group discussions is that the "study" be collective—a truly group effort. The groups should be small and have a definite membership, with the same people meeting together over an extended period of time. Each group should have designated leader, who supervises the discussion sessions. Thoughts and ideas are expressed verbally and every member is encouraged to participate. Informal yet controlled, this technique usually finds acceptance among both rural and urban groups and provides for an extension of the more formal PSYOP media channels. Group discussion, as a PSYOP technique, is extensively employed by the Communist agit-prop cadres. This technique and channel could be a significant link in the communication chain for the restructuring of attitudes.

In some environments, opinion surveys (attitude reports) can be conducted on a regular or irregular basis. Such surveys may give a general (or quite accurate) impression of the attitudes of selected groups of the population on subjects of current interest.

The questioning of hostile civilian detainees is a police, not a military function. However, during sweeps, civilians are detained and questioned by the military concerning tactical information. Again it is stressed that PSYOP exploitation of certain civilian targets can be as important as the exploitation of military targets. For example, the civilian infrastructure is a vital element in the total insurgent movement and should be a key target for PSYOP exploitation. The civilian infrastructure is probably the most difficult audience to reach, since it is hardcore and highly motivated to support the insurgent cause. Consequently, current PSYOP-related data are needed to exploit both the infrastructure and that portion of the civilian population in contested areas that supports the insurgency.

Travelers and refugees provide significant current information that can be used to piece together the conditions of daily life in hostile areas, and sometimes it is possible to project the attitudes obtained from such people to the general population in hostile areas. PSYOP is concerned with the

total picture of society from the individual as well as the group viewpoint. To this end, current information is needed on the nature of the daily occurrences and relationships among the primary groups, secondary group, and the enemy administration. Specific and detailed information is needed on a variety of subject such as: (a) personal security, (b) travel restrictions, (c) police methods and surveillance, (d) the role of religion and the religious leader, (e) traditional versus "progressive" social patterns, (f) the role of the small entrepreneur in the "new social order," (g) specific prohibitions in connection with the communication process, (h) the "tone of social control, (i) the role of education in the "new order," and (j) the extent and adequacy of social services.

Broadcast Monitoring

Broadcast monitoring is conducted by the Foreign Broadcast Information Service (FBIS) of the U.S. government on a worldwide basis. In addition to selected radio broadcasts, news and wire service transmissions are also monitored on a daily basis for analysis purposes.

OTHER SOURCES

Captured Documents

Next to interrogation of prisoners and defectors, captured documents are probably the most important source for PSYOP data. PSYOP intelligence has found that some of the most effective communication delivered to the Viet Cong and NVA has been based on material from captured letters and diaries. For example, the slogan "Born in the North to die in the South," widely used in PSYOP publications, was obtained from a diary of a North Vietnamese soldier. Also, nostalgic poems and letters written by VC and NVA soldiers have frequently been mentioned by returnees and prisoners as having had great psychological impact on them. It has already been mentioned that content analysis of official reports and other documents prepared by VC cadres provides significant information concerning: VC morale, the effect of GVN PSYOP programs, and definitive data on social, military, and political activities of the enemy.

Intelligence Sources

As of 1969 the Central Intelligence Agency (CIA) and the Defense Intelligence Agency (DIA) were the only contributors of intelligence for overt PSYOP programs. They provided the bulk of the current information needed to conduct overt PSYOP in denied or enemy-controlled areas in that they provided such information as we now have in regard to target analysis, testing, and the measuring of effect of communication.

Overt PSYOP communication channels directed to denied areas primarily employ radio (shortwave and medium-wave bands) and printed matter. In order to effectively use radio as a PSYOP channel, it is necessary to know:

- a. The quantity and type (SW or MW) of receivers available to significant target groups;
- b. The listening habits—what are the prime hours for listening to broadcasts;
- c. What are the prohibitions and restrictions in owning and listening to “enemy” radio broadcasts;
- d. What is the strength (clarity of audio signal) for each station;
- e. What jamming techniques are used, and what is the pattern of jamming;
- f. What specific programs appeal to each target (news, drama, opera, and the like);
- g. What is the best length for an average program? can the target audience listen for five minutes or five hours; and
- h. What is the reaction of the power elite and specific target groups to the program.

In addition, to prepare appealing and credible radio programs, a great deal of information is needed about the everyday activities of average people in the society. This requires large quantities of information that can be used as the basis for political commentaries, skits, discussions, and “letters of complaint.” As far as can be determined, this type of information is not currently available to support PSYOP programs.

Furthermore, information of the following types is needed for PSYOP printed media programs directed to hostile and denied areas:

- a. The pattern and area covered by specific leaflet drops;
- b. The method used by the hostile regime to recover leaflets; do they use the police, security forces, school children, or others to pick up leaflets?
- c. The prohibitions imposed on the retention of leaflets;
- d. The reaction of the general population to the messages;
- e. The reaction of the power elite to message content and programs;
- f. The reaction of specific targets to message content and programs.

Of course, data concerning the above questions are obtained from overt as well as from covert sources. For example, data on PSYOP leaflet and radio programs directed to North Korea are obtained from interrogation of captured agents as well as from political defectors. In addition, some information is obtained from content analysis of newspapers and documents, and still more comes from broadcast monitoring. Radio Free Europe, a private radio network in Europe, has a vast network of correspondents stationed along the rim of the iron curtain who interview travelers and refugees and exploit other sources of information from Communist countries in order to gauge the effect of their broadcasts. Consequently, the exploitation of covert sources is essential, if consistent, rather than random, feedback is to be obtained. In theory, it is possible for a covert intelligence system to provide information on PSYOP programs by using the full range of exploitation techniques,

Governmental and Intergovernmental Sources

In perspective, research and analysis of USIA are concerned with the total aspects of PSYOP intelligence. The foci of PSYOP EEI contained in the PSYOP intelligence model of this report are of prime interest to international communication organizations, and in particular to the USIA. For example, Robert Elder notes the following research priorities within USIA:

- a. Studies of effectiveness of Agency programs (EEI No.5 in figure 1);
- b. Attitude studies designed to test Agency objectives, audiences, and themes (EEI No. 5);
- c. Studies of communication principles, techniques, and environment (EEI No. 4);
- d. Media reaction reports (EEI No.5);
- e. Studies of Communist and other propaganda activities (EEI Nos. 2 and 3).⁴

The USIA is not an intelligence-gathering agency and it is, rightfully, very sensitive about this. However, it is concerned with communication research and analysis, and it conducts scientific surveys and prepares appropriate studies and reports. Moreover, in addition to its formal research, the daily contacts of USIA officers constitute a lucrative source of information for PSYOP. Valuable information is obtained from: field posts, contacts with the local press, contacts with the international press, activities in binational cultural centers, reports from local national employees, and contacts with the local bureaucracy.

In Vietnam the combined (military) intelligence centers (CIC), starting at corps level, produced intelligence in response to requirements generated by MACV J2 (U.S. military intelligence) and the J2 of the RVN military intelligence. The centers were responsible for gathering and reporting on a variety of information related to PSYOP programs. For example, the Research and Analysis Branch of the CIC was concerned with such subjects as order of battle, strategic intelligence, area analysis, the development of targets, technical intelligence (VC taxation, food, medicine, and the like), political intelligence, sociological intelligence (information on social and ethnic groups), and PSYOP intelligence for strategic programs. Studies produced by CIC dealt with:

- a. Effects of B-52 strikes;
- b. VC infrastructure;
- c. VC manpower procurement;
- d. VC outlook on life;
- e. VC tax collection in RVN;
- f. Vulnerability of NVA soldier in Vietnam;
- g. VC financial and economic structure.

Through content analysis, these reports reveal valuable information for PSYOP target analysis and possibly the effect of communication programs, and this data can be put into the PSYOP data bank.

Published Material

Published material contains the basic data that are the starting point for obtaining the answers to PSYOP EEI. Naturally, it does not provide current data about existing attitudes and the effect of PSYOP programs. However, an example of its importance is the library of the research element of Radio Free Europe. It contains over 34,000 volumes, over half of which are in the languages of the target nations, and the rest in Western languages. About 4,000 new volumes are received each year. In addition to books, the library handles the subscriptions and distribution of 700 Western and 550 Eastern European periodicals. Every month about 3,000 copies of various publications are routed through the library to the various editors, evaluators, and researchers.⁵

Foreign Area Studies of The American University publishes handbooks on many foreign countries that contain information on the general character of the society, the physical environment, historical setting, ethnic groups and languages, social structure, social values, political values, economic systems and values, and public information and propaganda.

In a similar way, the American Institutes for Research (AIR) Intercultural Communication Guides provide a source for political information, major social characteristics, cultural factors relevant to the communication process, and psychological principles for effective communication. They provide an introduction and clues to target analysis and the development of communication strategy.

The *National Intelligence Survey* provides information concerning military, political, and economic aspects of a particular national society. This information provides significant insights into PSYOP targets and communication media.

Publications from the U.S. Department of Commerce, the U.S. Department of State, USIA, the United Nations, and other private research organizations are also valuable sources of information in analyzing targets. Often published texts, scholarly journals, novels, and other literature can provide important insights into the society and the communication process. However, published material should be thoroughly analyzed, evaluated, and the data confirmed prior to use in PSYOP programming.

SUMMARY

The function of PSYOP is the use of communication to influence behavior. Human communication involves action; it is not mystical or magical. To understand communications one must, in a very real sense, understand people. PSYOP intelligence is the basis for understanding human actions in PSYOP.

The essential or basic elements of information required from PSYOP intelligence are: (1) a definition of key audiences; (2) an understanding of the attitudes and motivation of the individuals and groups in the selected

audience; (3) an analysis of PSYOP vulnerabilities; (4) a determination of appropriate message content and the best communication channels to reach the audience; and (5) a measurement of the effect of PSYOP programs.

PSYOP target analysis is important in order to identify meaningful population groups and subgroups as specific PSYOP targets. Further, target analysis provides important clues about the attitudes of the selected audience. In addition, it provides the data needed to anticipate possible resistance to communication content and the data for determining the most meaningful and effective communication strategy for a particular target. In sum, target analysis tends to bring the selected target closer to the PSYOP communicator.

In testing messages it is important to check the respondents for psychological as well as sociological representativeness. Moreover, in testing there are no clear-cut rules because each instance is unique. Before an estimate can be made of the reliability of a proposed test, careful consideration should be given to the following: (a) the nature of the communication, (b) the type of respondents available, (c) the overall psychological atmosphere in which the test is to be conducted, and (d) the techniques used to obtain the information.

Measuring the effects of PSYOP programs is of great interest to commanders, planners, and PSYOP programing personnel. Indicators of the effectiveness of PSYOP include immediate recall, delayed recall, repetition, "paper and pencil" behavior, physical response to the message, and content analysis.

This essay has discussed the exploitation of major PSYOP intelligence sources and related them to the PSYOP EEL. The various PSYOP exploitation techniques were discussed as they relate to: (1) prisoners of war, (2) defectors and refugees, (3) civilians (friendly, enemy, neutral), (4) broadcast monitoring, and other sources such as captured documents, intelligence sources, governmental and intergovernmental sources, and published and unpublished material.

NOTES

¹ This refers to the "Dicks' Questionnaire No. 3," which Dicks brought to its final stage as a "structured interview susceptible to quantification, in collaboration with Edward A. Shils. It was authorized for PWI use in POW enclosures on the continent by Colonel Gurfein. It was administered mainly by the Special PWI Team at SHAEF ('Kampfgruppe Rosenberg') and their results were tabulated and evaluated by Morris Janowitz." See Daniel S. Lerner, *Sykewar: Psychological Warfare Against Germany, D-Day to V-E Day* (New York: George W. Stewart, Inc., 1949), pp. 121-124.

ASIATIC GUERRILLA MOTIVATION*

BY JOHN M. LITTLE

An example of intuitive analysis with major PSYOP implications for appealing to insurgents.

Though underfed, poorly-equipped, ill-trained, and forced to inhabit the least desirable areas of a country, Asiatic guerrillas fight extremely well. What makes possible the achievements of these semi-literate peasants who lack air cover, high-speed mobility, artillery, and the other refinements of more sophisticated armies?

Promises or threats of terror do not seem nearly adequate in explaining why.

Most of our literature on counterinsurgency simply ignores the prime factor—motivation. We are much concerned with tactics and techniques for guerrilla fighters, but we seldom dig into motivation, the real soil from which successful military effort must grow.

The enemy pays considerable attention to combat motivation and discipline. Mao Tse Tung and Vo Nguyen Giap in particular emphasize and reemphasize it. Moreover, they do not just mention it in passing and then move on to tactics and grand strategy. Detailed concern with human behavior permeates their writing. Its effect in turning out first-rate regular and irregular fighters in Asia was seen in China, Korea, Malaya, Vietnam (*Viet Minh*), Laos, the Indian Frontier, and now again in Vietnam (*Viet Cong*).

We have attempted to rationalize their success at motivating their fighters, but not to explain it.

.... In describing motivation and discipline, the enemy speaks of it as "internal democracy" or "democratic centralism." Perhaps the use of such terms in a system so totalitarian as Communism causes us to overlook their real meaning. Being products of our system, a representative-type democracy, we immediately shrink from this as meaning that the troops will elect their officers and vote on which objective to hit or which column to ambush. We brush it aside as obvious propaganda. We must remember, however, that when Mao or Vo speak of democracy they speak of Communist democracy and not our system. Nor do they mean the ideal of Communism where the "utopia" is achieved and a "dictatorship of the proletariat" is the government. They mean democracy in the practical, present-day revolutionary sense of Communism where members are encouraged to criticize themselves and others, but within bounds of the party line. This is the meaning of the terms "internal" and "centralism."

*Excerpts from "Asiatic Guerrilla Motivation," *Infantry*; LVI (January-February 1966), p. 83. Reprinted with permission of *Infantry Magazine*, copyright holder.

The individual is encouraged to participate critically in discussing the means, but is not allowed for a moment to consider the end. That has been decided for him. They have no concept of parliamentary balloting in the ranks, and the performance of their armies should make this quite clear.

The enemy outlines this "democracy" as a critique, plain and simple, but with all unit members being encouraged to participate. Rather than a debriefing or critique by a superior to subordinates, it is a unit discussion group, guided by the superior, of course. Once again, grave doubts arise in our American minds for we visualize the pointless "gripe" session which many of us have seen tried, usually only once, by a well-meaning superior. This is not at all the case.

The discussion and criticisms are directed specifically toward the military soundness of actions and orders in an exercise, move or battle. Though political results are the ultimate end and are given lip service in revolutionary slogans, the individual is guided toward constructive criticism of tactical decisions and choice or application of techniques. Though the guerrilla is expected to end his statement with something like "we must avoid petty-bourgeois individualism," "to crush the national and class enemies," or "in the process of its transformation (*Viet Minh*) into a regular and modern army, our army always remains a revolutionary army, a people's army," he is also expected and encouraged to give of himself to that "great cause."

Even if little value comes from suggestions made or errors brought out by privates, though this possibility should not be too readily discounted, the 5 or 10 or 15 individuals in the unit are made to publicly belong, almost completely. *This is the essence of their combat motivation.* Once recruited by whatever means, the individual strips himself naked before his comrades, admits his own weaknesses, and vows to strive for better accomplishment of the mission in the future. He has subordinated his individuality to the unit and is under much greater pressure to make good the vow "next time," since all his teammates have heard him make it. He is much more highly motivated now than if it was a personal, secret vow made to himself while a superior was chastising him in a standard debriefing. Each individual in turn faces his fellow soldiers and speaks out, sharing with them the very personal fears, anxieties and emotional reactions or physical failings experienced under fire or in a gruelling march. They share these experiences and in so doing they weld themselves together. As most combat veterans in our own ranks will agree, the bonds between men who have been under fire together are strong indeed.

In this way the enemy draws his small units together into tight, cohesive groups that strive toward what we frequently call "fanatical" performance. They fight like this because they know that their comrades' eyes are upon them and they are going to have to face up to their conduct publicly at the first break in the action.

They fight like this because the semi-literate peasant of Asia has

recognized quite clearly what our highly-educated researchers have been telling us since early in World War II. Namely, that men fight, whether enlisted or drafted, primarily for the men they fight beside and for the image they present to their fellow soldiers. All the tactics and techniques and training in the world won't move a man against enemy fire with firm purpose if he doesn't care what his buddies think. He is not an unthinking, Prussianized robot. He is very, very conscious of the group and his place in it.

Direct Observation

UNCONVENTIONAL WARFARE—THE PSYCHOLOGICAL ROLE OF SPECIAL FORCES*

BY WILLIAM P. YARBOROUGH

Special Forces are often in a position to observe developments that may have important ramifications on the attitudes of target areas, as well as the actual audience attitudes.

The Special Forces of the United States Army were designed for employment in several types of environments each having pronounced psychological overtones. In their primary role, that of unconventional warfare, Special Forces will be in contact with friendly guerrilla forces and will provide a positive link between the irregulars and the conventional commands. The nature of the unconventional warfare structure, which produces the guerrillas with which Special Forces work, must be understood in order to appreciate the importance of the psychological component of the Green Beret's make-up.

Guerrillas are an action element of the total unconventional warfare system but they do not comprise it entirely. Moreover, guerrillas will not appear as the first manifestation of a well-conceived and organized resistance movement.

A guerrilla warfare capability of any significance is normally based on a broad clandestine and covert support structure. The latter is rooted in the civilian population and usually numbers many times the strength of the guerrilla units it serves. The underground which makes guerrilla operations feasible does not develop automatically nor spontaneously. A great deal of careful, sophisticated, patient and time-consuming work on the part of highly motivated resistance architects goes into its design.

Members of a resistance underground live and work surrounded by great danger to themselves and to their families. It is evident, therefore, that the stakes for which they are willing to risk everything must be high. These are usually political. Sacrifice in serving in an underground organization that is hounded by special police and by counterintelligence agents can be justified in the minds of those who feel most deeply that their

*Original essay by Lt. Gen. (Ret.) William P. Yarborough.

future and the future of their country can be made better through their efforts. Guerrilla forces which grow from the underground recruiting processes must have the same convictions—many with a firm political base. The mechanics of keeping guerrilla and underground forces' zeal at the required level must involve inspirational approaches which are simple, powerful, consistent, and persistent.

It is necessary for the outside forces who work with guerrillas to understand the vital part that belief in cause plays in the making of an irregular soldier. Granted, there are classical pressures which are used to force an individual into guerrilla ranks against his will. Frequently a combination of inspiration and terror are used to move a "volunteer" from his village to a guerrilla camp in the jungle. In any case, both the guerrilla and the vast infrastructure which supports him are dependent upon psychological considerations more than any other.

The history of resistance movements shows conclusively that guerrilla leadership must be indigenous—not imported from outside. This being the case, U.S. Special Forces would be ill advised to seek command of guerrilla forces with which they have been placed in contact. Nevertheless, the interests of the United States, which in the first place led to the introduction of the Special Forces teams, must be appropriately served. It follows that the Special Forces soldier must have a clear understanding of what his country's interests are and he must seek, with judgement, finesse, firmness, and diplomacy to serve them in dealing with the guerrilla leaders. He can, of course, attempt to guide the indigenous guerrilla leader toward desired tactical objectives by regulating the flow of supplies and resources from U.S. stockpiles. This kind of persuasion, powerful as it is, may not always work.

The greatest guarantee of cooperation from irregular forces can come from the close personal rapport which a mature, carefully selected and trained Special Forces team leader can develop with the guerrilla leader. Even when the relationship is close and there is a mutual respect and confidence, the nature of the guerrilla's commitment to his political cause and future may preclude his acceding in every respect to the United States' requirements voiced through the Special Forces Commander. The latter must be the type of individual who can understand the nuances and intangibles that make his role in the irregular warfare scheme so different from that of a liaison officer with foreign conventional forces. Historical accounts of problems stemming from personality clashes between Draza Mihailovic and Colonel Bailey, the British liaison officer to the Yugoslav partisan headquarters during World War II, point up the extra-ordinary impact that human emotions can have on official negotiations.¹

United States Special Forces introduced into a conflict arena to work with guerrillas could find themselves enmeshed in several kinds of situations, none of them simple. The guerrillas may be fighting for their own government under siege by an invading enemy. In this case, the motivational propaganda which sustains them would come from that govern-

ment. The latter would of necessity be compatible enough with U.S. aims to have warranted introduction of U.S. Special Forces in its support. In such an environment, U.S. Special Forces would be expected to do nothing which would interfere with the mental conditioning of the indigenous resistance mechanism. Here the requirement for intensive indoctrination and meticulous selection of the Americans is apparent.

In recognition of the difficulties surrounding psychological operations carried out by resistance forces, U.S. Special Forces should provide appropriate assistance beginning with matériel and instruction in its use. Guerrilla forces should be taught field expedients for leaflet production and distribution. The value of simple slogans painted on walls and of face-to-face persuasion should be stressed. Finished intelligence, received through the U.S. link with Special Forces Operations Base and which can assist in psychological targeting, can be provided by the U.S. Special Forces to the guerrilla leaders.

Generally, the propaganda content of guerrilla psychological operations activities should not come from U.S. Special Forces. Rather it should come from the guerrillas' own government through the established communications system of the friendly underground. Thus the U.S. Special Forces contribution would consist largely of advice in planning, training in simple techniques, and provision of certain supplies and equipment from U.S. resources.

Another type of unconventional warfare situation in which U.S. Special Forces might be used could be that in which guerrilla forces supported by an underground resistance movement were challenging a government, which for various reasons was unacceptable to the people of the country. In such a case, the introduction of U.S. Special Forces would be preceded by the most exhaustive analysis of the situation to determine whether U.S. interests actually demanded involvement in what might seem to be another country's internal affairs. Lessons of current history seem to place this kind of projection of Special Forces use fairly low on the probability scale. In the event, however, that Special Forces were used, their psychological role would probably not be limited to the provision of training and materials to the forces of the resistance. Certain aspects of the United States own psychological campaign against the enemy government could be reflected through Special Forces to the friendly guerrillas and their supporting infrastructure.

Intelligence is the life blood of effective psychological operations. Special Forces deployed in contact with guerrilla forces are in a position to gather the kind of intelligence that bears most intimately upon the attitudes of the people at grass-roots level. Propaganda programs which are shaped in the absence of extensive knowledge of feelings and persuasions of human target groups are likely to succeed only through rare luck and in defiance of the laws of probability.

In his classical work, *Psychological Warfare*, Paul M. A. Linebarger points out that some of the worst blunders of history have arisen from

miscalculations of the enemy state of mind. He indicates that psychologists can set up techniques for determining how people really feel about certain conditions and situations. Special Forces, in carrying out the psychological aspects of their unconventional warfare missions, need to be trained in or at least familiar with such techniques so that the products of their intelligence collection can be usable for something other than order of battle refinement.

The opportunities for intelligence collection concerning popular attitudes are widely available to Special Forces assigned to missions bearing upon internal defense and stability of an ailing foreign country. The activity, which was once termed "counter-insurgency" by the United States Army and which involves everything from civic action to counter-guerrilla warfare, is still carried as a valid type of employment for Green Berets. Students of "counter-insurgency" will recognize immediately the pitfalls inherent in the application of the accepted doctrine which has developed during the last decade. Nonetheless, certain aspects of what is held as valid and is taught in internal defense and stability instruction are being implemented quietly and with success. In every case, the acceptability of the Special Forces personnel in the country where they are to operate is of overriding importance.

Interviewing

EFFECTIVE COMMUNICATION BY AMERICANS WITH THAI*

BY IMOGENE E. OKES**

After researchers determined the objectives of American communications in a foreign country, they evolved a multi-step research method. This approach channeled the knowledge of experts to ascertain whom the Americans should contact, what they should say, and how their messages should be presented.

....A psychologist, a social psychologist, sociologists, an historian and international relations scholars devised the research method. The problem was to (1) realize the American's objectives, (2) select the audiences most susceptible to his objectives and, at the same time, most effective in taking action on those objectives, (3) reduce the number of objective-audience combinations to those desirable for intensive study, (4) develop ideas appropriate for appealing to the audiences, (5) identify the key symbols in the appeal ideas, and (6) provide information regarding media and communication customs to be observed in transmitting the ideas.

*Excerpts from "Effective Communications by Americans with Thai," *Journalism Quarterly*, XXXVIII (1961), pp. 337-341. Reprinted with permission of *Journalism Quarterly*, copyright holder.

**The author is indebted to Prof. Kempton for suggestions on format, Dr. F. Loyal Greer for advice in interpreting the research method, and to Dr. Kenneth P. Lang, for reviewing the Thai data.

USE OF CONSULTANTS AND MAILED QUESTIONNAIRES

Considering the limitations of budget, research staff and time, it was decided the most effective and economical method for systematic collection of objective data would be to use American consultants as sources of information and mailed questionnaires as research instruments.

Americans familiar with the country could supply an abundance of current information. Use of numerous consultants would serve as a safeguard for objectivity. Agreement among experts would enhance the probability of the results being valid.

Questionnaires would stimulate the thinking of the American specialists and channel their knowledge so that the desired information could be obtained and the responses compared. The research would be conducted in phases as dictated by the several parts of the total problem. Within each phase, there would be a series of steps: a great volume of information would be collected; this would be sifted; only the data surviving evaluation would be offered as the basis for the next phase of the research.

By mailing the forms to the respondents, they would be able to work alone beyond possible biasing by other consultants or by the researcher. Furthermore, a large number of respondents could be utilized inexpensively by resorting to correspondence.

Forty-one Americans proficient in Thai affairs participated in one or more phases of the research. Their names had been secured from bibliographic listings, government offices, private foundations, professional organizations and nominations by other consultants. They had quite varied backgrounds. All were college graduates and 17 held doctorates. They had first-hand knowledge of Thailand from having resided there recently for an average of three years.

ENUMERATION OF OBJECTIVES

The research committee, very realistically appraising the current competitive international situation, listed 10 objectives for the American communicator in Thailand. These are, briefly, as follows: promote good will toward the United States, promote expectation of success for the United States and its friends, encourage cooperation with the United States, show importance of developing new energy sources, arouse hostility toward Chinese Communists, discredit the Communists, show appreciation for Thai accomplishments, convince of non-interference by the United States in internal affairs of Thailand, instill hope for the future and strengthen common ideals for Thai and Americans.

SELECTION OF AUDIENCES

In selecting audiences best suited for American purposes, researchers scanned the literature and made up an initial list of 16 identifiable groups. They were categorized as occupational, ethnic, religious, family-kinship, political, leisure time, social class and age-sex. Each was described ac-

cording to physical appearance, ethnic origin, language spoken, occupation, level of education, etc. The list of 16 audiences was expanded to 24 by consultants.

In the next step, consultants ranked and rated audiences for effectiveness ¹ within their own country and for susceptibility ² to American overtures. Since research resources were limited, this procedure permitted focusing on the audiences most valuable for communication purposes.

At this stage of the research, a statistical technique ³ was employed to ascertain the degree of agreement among consultants. Average intercorrelations between the seven consultants ranking effectiveness was $+ .63$. Had the research results been compared with those of another seven consultants, the predicted correlation for effectiveness would be $+ .92$. Average intercorrelation between the seven consultants rating susceptibility was $+ .54$. Had the research results been compared with those of another seven consultants, the predicted correlation for susceptibility would be $+ .89$.

Adding the statistically converted consultant opinions on effectiveness to those on susceptibility and arranging the results in numerical order produced a ranking of audiences according to importance for purposes of the research. The 10 specific audiences selected ⁴ were Administrators, Buddhist Priests, Central Thai, Chinese, Mass Media Personnel, Military-Political Forces, Professional Classes, Royalists, University Faculties and Students, and Western Educated Elite. To provide information for the country generally, Thailand as a Whole was added.

Communication specialists rank ordered the objectives according to relative importance. Again observing research limitations, there followed another reduction step which served to focus energies of consultants on the most important objective-audience combinations. (Here, and in the ensuing research, assignments were made to consultants according to their self-appraised knowledge of specific audiences considered in the study.) Obviously, all objectives should be covered for Thailand as a Whole. Consultants were then asked to register their opinions as to the feasibility of accomplishment of each of the 10 objectives by each of the 10 specific audiences. Of the 110 possible objective-audience combinations, only 43 were selected for intensive study.⁵

DEVELOPMENT AND EVALUATION OF APPEAL IDEAS

For the 43 objective-audience combinations consultants were asked to develop appeal ideas which would gain and hold attention, be readily and completely understood, be believed and accepted, arouse appropriate motives and emotions, affect all members of a particular group similarly, and be effective in the foreseeable future. Consultants were also asked to explain the appeal idea in terms of cultural factors relevant to the particular audience.

Since the key symbol often is solely responsible for inducing the desired response from a particular audience, the identification of the key symbol

by the appeal writer was especially important, The key symbol is considered potent when it causes audience identification, automatic acceptance of the appeal, predisposition toward the objectives of the communicator and/or strong emotional response consistent with the appeal.

The 150 appeal ideas developed were rated by another group of consultants for persuasiveness or the likelihood that the appeal idea would lead the audience to think, feel and/or act favorably toward the American objective. An appeal idea created by one person was evaluated by three other consultants. Appeal ideas of low persuasiveness or boomerang effect were eliminated. Fifty-seven appeal ideas survived this screening; 39 were for the four most important objectives.

Researchers stressed that the resultant appeals were merely ideas intended only as guides for the American communicator and were not to be considered as finished messages ready for transmittal.

Typical of appeals rated relatively high is the idea developed for Professional Classes in order to show American appreciation for Thai achievements. The audience would be reminded of the words to the chorus of the popular song, "Thai Ancestors," in which Thai are challenged to uphold the tradition set by their ancestors who were bold and steadfast in their determination to preserve Thai territory for their descendants.

A highly evaluated appeal idea suitable to Thailand as a Whole for arousing hostility toward Communist China would be a picture of a Red Chinese dragon (with North Korea, Tibet and North Viet Nam in its belly) attacking a Thai. The caption would read, "The Chinese dragon has always sought to gobble up Asia." Consultants said that a crocodile could be used instead of a dragon as both are symbols of greed. This appeal idea should remind the Thai that Chinese expansionism today is a continuation of past policies.

All the 83 key symbols identified in the appeals were indexed by word association, by category and by picture for the convenience of the communicator. He was reminded that symbols can change meaning according to context and consequently must be used with caution if employed for purposes other than those indicated.

An analysis of the 57 appeal ideas revealed that they were based on six main themes: equality, economic strength, friendship, nationalism, anti-Chinese Communism and self-interest.

INFORMATION REGARDING MEDIA AND COMMUNICATION CUSTOMS

In an effort to gather information of value to the American communicator in transmitting his messages, consultants were given a questionnaire designed to draw out their knowledge regarding mass media and communication customs. Though information was solicited for specific audiences, it was generally found that the data were applicable to all audiences. Information for a particular audience was given when it was

especially significant. Some sample findings were that word of mouth is still the best means of communication in Thailand, that movies are popular throughout the country, and that radio receiving sets are widespread. Printed materials have less appeal since the people are not conscientious readers.

Thai would consider the cartoonist rude who characterized a man, even one greatly disliked, as an animal. By custom, the Thai expect modesty and courtesy in personal conduct and place emphasis on usage of titles. Their tonal language easily lends itself to double meaning. Thai gestures, especially those pertaining to the head (respected) and the feet (contemptuous) carry much significance. The Thai place great faith in supernatural beings.

Though Thai take pride in their own culture and uphold certain traditions, they generally tend to look to the future. Thai are very curious about all things in the United States; they are critical of American lack of knowledge about Thailand and Asia; but so admiring of some American ways as to imitate them.

CONCLUSION

By a multi-phase process, information was obtained for the American communicator regarding his objectives, audiences, appeal ideas, symbols, and media and communication customs. Series of questionnaires within each phase of the research permitted the collection of a wealth of material from numerous area experts and evaluation of their data. By this funneling process, only potentially useful material was offered to the American as guides to more effective communication in the foreign country.

The important attribute is that the systematic and objective method devised for the research can be readily adapted to similar studies.

Sampling

THE SAMPLING PROCESS FOR PSYOPERATORS*

BY RICHARD H. ORTH

Good sampling is an effective means of reducing the number of persons contacted to develop a relatively accurate picture of the sample populations's attitude and opinion.

*Original essay by Richard H. Orth.

INTRODUCTION

The basic unit for a survey is the population of the area in which it is being performed. It is not usually possible to include the entire population; rather, people are selectively chosen to participate in a survey. Because the way in which these people are selected to participate is very important to the utility of the results, great care must be used in the selection process. This essay discusses the problems that are involved in deciding who will be in the survey and who will not be in the survey and also what kinds of selection procedures the PSYOP analyst can use.

WHY USE SAMPLES?

The basic notion behind sampling is that an analyst can gain accurate knowledge about a population by measuring only a portion--or sample--of it. There may be some instances when one would not wish to sample--for instance, when the population is a very small village or when social or religious customs do not allow certain persons to be interviewed. Also, in some cases, interviewing a few, well-informed persons may be more efficient than taking a sample of the whole population. In most cases, however, there are good reasons for sampling, one of the foremost being cost limitations in terms of effort, time, and money spent. Clearly, the more people included in a survey, the greater the cost. Another reason for sampling is that when one wishes to assess a change in the attitudes of a population, the initial assessment of the attitudes may well spoil the accuracy of the second measurement. Thus, if the entire population were used in the initial assessment, it should not be used in a second assessment to determine the amount of change. There are several reasons that people generally perform differently on a second attitude questionnaire than they do on the first:

1. They may be able to determine the kinds of answers that the tester is most pleased with.
2. They may become aware of things that they were not aware of before but were brought out by the questions that were asked.
3. Performance changes with practice.

The second reason mentioned above is often called sensitization. As an example, suppose that a PSYOP campaign is being carried over a specific radio program. In attempting to measure the success of that campaign, people within the broadcast area are asked if they listen to the program. This would give some indication of how well the campaign is reaching the target. This could easily arouse the interest of some persons who would not otherwise have been interested and therefore would not have listened to the program. On the follow-up measure, consequently, there may result an artificially high success rate because more people tuned in to the program than would normally be the case. (It should be noted that this may be used as a device to obtain listenership, but it could backfire if used too often.)

The way to solve this difficulty is to use only a part of the population--by sampling, the analyst may greatly reduce his costs and not "spoil" the entire population for repeated measurement.

There are several problems involved in sampling, and great care must be taken in using sampling techniques. One must face, from the beginning, the question of accuracy. It is easy to see how the measurement of only a portion of the population could greatly reduce the accuracy of the results. Besides the size of the sample, another factor that can operate to reduce accuracy is the representativeness of the sample. Both size and representativeness affect the applicability of the generalization to the population as a whole. When the analyst chooses a sample from a population, his purpose is to be able to generalize--to derive a general conclusion from particulars (the sample)--to the whole population. A generalization is justified to the extent that the sample represents the population. In the following portions of this essay, size and representativeness will be discussed in greater detail along with different types of samples and when and how to use them.

DEFINING THE POPULATION

The first thing the PSYOP analyst must do is to define the population he wishes to study. To do so he must ask himself three questions:

1. "What am I trying to find out?"
2. "Who can tell me what I want to know?"
3. "To what population do I want to generalize?"

The answers to these three questions provide the information for defining the population. The following the sequence of questions shows how this works. Assume the answer to the first question is "The effectiveness of a PSYOP campaign aimed at a particular tribe in South Vietnam." The answer to the second question will then be "The members of that tribe." The answer to the third question will be: "The tribe." Therefore, the population is defined as the tribe. Rather than questions number two and three always being the same, they provide an interactive process that allows resolving the difference between availability of individuals and the generality of the results.

TYPES OF SAMPLES

After defining the population, the PSYOP officer must then decide what kind of sample he will draw. Ideally, he will seek a sample that is as efficient and inexpensive as possible while still being representative of the population. There are basically two kinds of samples: *nonprobability* samples and *probability* samples.

Two terms that will frequently come up in the following discussion of different samples are: (1) *random* and (2) *chance*. There is often a problem associated with their use in that they have common-language connotations as well as their denotative meanings which come from statistics and mathematics. As used in the following discussion, the terms will be

used only in their denotative sense. Thus, random refers to an unknown probability level that can be calculated only if all the elements of the universe can be specified. However, it is sufficient to say that each element has an equal likelihood of appearing on any one trial. If one has an infinite number of trials, each element will have appeared the same number of times. On the other hand the term "chance" is usually used as an adjunct to an implicitly or explicitly known probability level. Thus, one can say that there is a 20 percent chance of rain today. It must be noted that both of these terms imply an orderly occurring set of events that can be reduced to mathematical equations.

Nonprobability Samples

Accidental Sample

The accidental sample is the easiest to select, but it usually is not representative of the population from which it is drawn. (In fact the ease of selection is due to the fact that there is no overt selection. Only individuals who come to you are included.) For example, an accidental sample may be drawn by going to a street corner and interviewing every person who goes by. Many people believe that because the interviewer cannot control whom he interviews that this is a random sample. Although there is an appearance of certain amount of chance attached to the drawing of an accidental sample, actually it is not a random process, because one cannot determine the probability of any person being included in the sample. In other words, this kind of sample does not meet the requirements of a random sample. The accidental sample may not represent a population fairly but rather may be seriously biased, because the sample will represent only those people who are in a particular place at a specific time. Many kinds of people may never go to that street corner; the ones who do go may be of a type not representative of the whole population.

When Should An Accidental Sample Be Used? Almost never, or only when no alternative seems available. However, it may be better to have poor data than no data at all. If this method is used, one must keep in mind its lack of representativeness. Poor data are, in fact, worse than no data at all.

Quota Sample

A second type of nonprobability sample is called the quota sample. This means that each interviewer is given a number of persons of a specific type, for example, farmers, merchants, ex-soldiers, women, or elders to interview. The advantage of the quota sample over the accidental sample is that the former is designed to include desired numbers or proportions of different types of persons. In the accidental sample, on the other hand, there is no assurance whatsoever of representativeness, so that certain types of persons may be missed completely.

In the quota sample, the person who will actually be interviewed is decided upon by the interviewer in the field. For example, he may wish to compare the reasons that North Vietnamese soldiers entered the Chieu Hoi Program with the reasons that the Viet Cong entered the Chieu Hoi Program. Since these people (called *hoi chan*) remain in the camp only a short time, it would be very difficult to perform a carefully drawn random sample, which involves having a list of the population. Therefore, the PSYOP analyst may simply say that he would like to have a certain number of North Vietnamese defectors and Viet Cong defectors interviewed. The interviewer then enters the camp, finds out into which category (North Vietnamese or Viet Cong) the particular individual he is addressing falls. He indicates the category on his interview record and proceeds with the interview. If he already has his quota from the category this individual is in, he can skip this interview. When he has filled the quotas of both North Vietnamese and Viet Cong (the number of each type that the analyst requested), the data collection part of the study is completed.

There are obviously some problems associated with this sampling technique. One must consider the representativeness of a sample drawn in this manner. The major threat to representativeness is the manner in which the interviewer obtains the sample. Most likely he will administer the instrument to those people who are most available or willing to talk. Clearly, they constitute a special segment of the population. Nevertheless, this limitation does not rule out the utility of quota samples in many instances.

When Should a Quota Sample Be Used? Only when the analyst knows exactly what type of person he wants to interview; this type is fairly easily recognized. The advantage of quota sampling is that it does not require the population lists or dwelling-unit maps that are needed for probability sampling. The disadvantage is that there are some doubts about the representativeness of the population. It would be better to use a probability sample if the situation allows.

Probability Samples

The next three types of samples are probability samples. This means that each element of the population has a known probability of being included in the sample. The PSYOP analyst must draw a probability sample if he wants to be able to generalize to the whole population from which the sample is drawn. The nonprobability samples just discussed (the accidental sample and the quota sample) do not give him any knowledge of the probability of any person in the population being included in the sample.

Simple Random Sample

In a simple random sample each person in the population has an equal probability of being included in the sample. For example, if a sample of ten persons were to be drawn from a population of 100 in a simple random

sample, each person in the population has a known $1/10$ or .10 percent chance of being in the sample because of the way the sample is drawn.

The drawing of a simple random sample proceeds as follows. Assume that there is a population of 600 and that the analyst wants to choose a sample of 100. Thus he wants to take every sixth person. Imagine that he has a six-sided die with a number on each side from one to six, with no number repeated. He also has a list of the people in the population, a residence list, or a list of numbers taken from a numbered dwelling-unit map (see the following section on population lists and dwelling-unit maps). He tosses the die and starts in the population list at the number that comes up taking every sixth name. Now it can easily be seen that any side of the die has the same chance of coming up as any other side. Thus, the starting point on the list could have been any of the first six names, with an equal chance for each name. Finally, since all the other names depend on the first, they also are determined by chance.

The same thing can be done by having slips of paper numbered from 1 to 6, in this case mixing them up in a container and drawing one of them out to determine the starting point. The total number to use is determined by the size of the sample needed (see the section on sample size) and the size of the population. Another alternative, of course, would be to put a number for each individual in the population on a slip of paper. One can draw out enough slips of paper to cover the entire sample. However, this method usually takes much longer and does not insure any more "randomness."

When Should a Simple Random Sample Be Used? When one wants to be able to generalize to the whole population from which the sample is drawn, or when one wants to use inferential statistical techniques, this is the simplest kind of probability sample. It requires no knowledge of the population other than a list of its members or dwelling units.

Stratified Random Sample

There is another kind of probability sample called a stratified random sample. Here, each individual in the population does not have an equal chance of being in the sample. The analyst divides the population into two or more strata on the basis of one or more characteristics. Each stratum then is treated like a different population, and a simple random sample is drawn for each. These subsamples are then combined to form the total sample.

For example, assume that the analyst wants to find out the relationship between amount of wealth and certain attitudes and he knows that there are (in a population of 100) 20 wealthy, 60 average, and 20 poor persons. Then, in a simple random sample, there is too little chance for the wealthy or the poor to be included. Because he is studying the attitudes of the total population, he wants information on all income groups. Thus he needs a sufficient number from every group to be relatively confident that their views are accurately expressed. The population is divided by the

characteristic of wealth into the above three groups, and same number of each subgroup is sampled separately.

When Should a Stratified Random Sample Be Used? The stratified random sample may be used when it is known in advance that a special segment of the population would not have enough persons in the sample if a simple random sample were drawn. As prerequisite for this type of sample one must know the characteristics on which the strata are chosen and one must have a population or residence list.

Cluster Sample

A third type of probability sample is the cluster sample. It is often profitable to do the sample on a cluster basis when the population from which a sample is to be drawn is very large and distributed over a large area. This means that the population is divided into geographic areas. The sampling process is the same as it is when individuals are being sampled, except that it is geographic regions that are being sampled. As the sampling proceeds the areas become progressively smaller as the following example illustrates. First, draw a random sample of states, provinces, or large regions, as described under random sampling. Then, in the states or large regions that were drawn in the samples, repeat the process for countries or smaller areas, then cities or villages, and, finally, for persons within each of the cities or villages. If the sampling is done on a random basis at each step, the end-result will be a random sample of people in the country. In this way, the need for population lists for the entire country is avoided. Population lists are not needed until relatively small geographic regions are arrived at.

When Should a Cluster Sample Be Used? When the population to be sampled is very large. It requires a population list or a dwelling-unit map of the city or village, but not for the entire country.

POPULATION LISTS AND DWELLING-UNIT MAPS—TOOLS FOR SAMPLING

Most of the sampling theory and practice has evolved in the United States and other developed nations. Consequently, many problems arise when using them in developing countries. For example, one of the most common assumptions in sampling theory and practice is the availability of census data such as population list, residence lists, or dwelling-unit maps. While these are readily available in the United States, reliable lists or maps are often unavailable in developing countries, and thus a probability sample is often impossible to obtain.

Another problem of sampling on the basis of population lists is ending up with respondents who are great distances apart. In such a case, the PSYOP officer might do well to phase the survey so that he reaches the people in one region during one phase and the people in another region during another phase. This solution is not without its problems. For example, suppose that you are doing an attitude survey in South Vietnam

and you want to determine how the people feel about retaliatory B-52 strikes against North Vietnam. If you do the study in two phases (it could actually be any reasonable number of phases), something could occur during the time interval that would result in a change in the attitudes—that is, a village in the area you are testing could have been bombed by accident. Because of the time factor, a preferred technique would be to divide the staff between the two areas and to sample concurrently but independently. Although this could cause some difficulties in the administration of the survey, it could yield quicker and more germane results.

If population or residence lists are not available, the most obvious solution is for the analyst to draw up his own list. This, however, is usually too costly, since it amounts to taking a census for the area. One alternative is to use dwelling-unit maps of the area, although there are some areas in which obtaining a map is not the simple process that it is in the United States. Also, if the area studied has a high proportion of nomadic people, dwellings may appear and disappear at very short intervals, making any dwelling-unit map quickly outdated.

Under the above circumstances, the most convenient method of obtaining a dwelling-unit map may be as follows. In most areas where military intelligence is gathered, the military has aerial photographs of that area. If the PSYOP analyst can get copies of these photographs, they can be used as maps or as the basis for maps. In fact, military intelligence units often will construct the maps from such photographs.

If dwelling-unit maps are not available, the PSYOP analyst, if he wishes to expend the time and money, can draw accurate maps from a survey of the area. Alternatively, he can go through the streets of the villages and lay out the dwellings on a map that contains only gross characteristics of the area to locate the residence pattern according to landmarks as in the following figure.

Once a map is obtained, give each residence on the map a number, make a list of the numbers, and draw the sample of dwelling units like a random sample.

Still another technique to help in drawing the sample is the grid method.¹ This method requires any drawn-to-scale grid map of the area being studied. The number of intersections on the grid must be more than the sample size. Then, one randomly picks an intersection on the grid and samples the nearest dwelling to that intersection (by use of triangulation and a pedometer, for example). The random selection of points on the grid is done in the same way as the random selection of people described above or by using a random number table. All that the grid method really does is to approximate a map of the dwelling units of the area, for if the grid were sufficiently accurate each dwelling would be represented by an intersection on the grid.

The type of person to be interviewed in a particular dwelling unit—that is, head of household, first person seen—must be chosen beforehand.

Dwelling-Unit Map

Devices exist that can be used to select the specific individual according to some known probability pattern. However, there are several pitfalls for using such a method in another culture or in a region in which little data exist about household characteristics. For example, there may be religious or other reasons for a woman's not talking to strange men, or women may hold a place in the culture that makes them noncredible sources. Under such circumstances it may be better to limit the individuals interviewed to those who represent the household and to guard against making generalizations beyond heads of households. The basic point is that the PSYOP analyst must have some knowledge of the culture before deciding upon the individuals to be included in the sample.

SIZE OF THE SAMPLE

A final step in the sampling process is determining how many people will be included in the sample. It may be beneficial to begin discussing sample size by using an analogy. As an illustration suppose a man owns a car that rattles every time he hits a bump. He takes it to a body shop and one of the men there takes the car on a road test. The tester must drive the car far enough to be able to hear the rattle, for if he drove it only one block, and the road was smooth, the rattle might not be detected. On the other hand, he does not want the tester to drive the car 50 miles because that would be a waste of his time and money. The size of a sample must, likewise, strike the appropriate balance. It must be large enough to do the job, but small enough to be workable.

In this regard, cost and accuracy should be considered when determining the size of the sample. Although these factors will be treated separately here for ease of discourse, the analyst must keep in mind the fact that they impact on each other.

Since cost limitations are usually available before the survey begins, these will be discussed first. Thus, the psyoperator should consider the cost per person interviewed when deciding on the size of the sample and, further, he should determine the number of man-hours that will be spent in collecting the data. Once transportation to the locale has been provided, later interviews may be less expensive than the first ones. One item that is all too frequently overlooked is the cost of analysis of the data that have been gathered. Even though the data collection phase of the survey may be very inexpensive, the analysis of those data may be quite costly. In other words, the analyst must consider the cost of the entire survey, not only the cost of the data collection. The same argument can be made in terms of time. The psyoperator may have a limited amount of time to complete the survey and to perform the analyses. This means that the sample size must be guided by the usable resources of the person who is conducting the survey.

On the other side of the coin is the degree of accuracy desired or demanded by the survey. Recall the analogy to road-testing a car. The farther the repairman drives the car, presumably the more accurate his

judgment will be about the location of the problem. In sampling, it is obvious that the greatest precision will be achieved when the entire population is tested, and as the proportion sampled gets smaller, so will the precision of the results.

There is an additional consideration that affects the number of individuals needed for accuracy, and that is the way the population is expected to divide in their responses. Suppose the analyst asks a sample of people a question that can be answered with one of two alternatives. He wants to be quite certain that the percentages in the sample really represent the population percentages. (In survey research, 95 percent certainty is the usual goal.) The size of the sample depends on the amount of difference in the percentages and on how accurate the analyst wishes to be.²

Table 1 shows that if there are large differences in the population, a small sample will bring this out clearly; but, if the differences are small a larger sample is required. To summarize, the important thing to remember when thinking about the size of a sample is that accuracy and cost are often in conflict. The PSYOP analyst must achieve a balance between the two.

Table 2 is an overview intended to help the analyst decide on the sample technique he will use. It should not be considered as a substitute for the preceding text, nor should it be used uncritically. Recall that the accidental and quota samples (numbers 1 and 2 in Table 2) are nonprobability samples: there is no knowledge of the probability of an element of the population being included in the sample. They should be used only when a probability sample is not possible. Simple random, stratified random, and cluster samples (numbers 3, 4, and 5 in Table 2) are probability samples: each element of the population has a known probability of being included in the sample. They should be used when one wants to be able to generalize to the whole population from which the sample was drawn. The table below shows sample sizes for 3 levels of accuracy and two statements about the distribution of responses. Clearly, it is very useful to have some idea about response distribution.

TABLE 1³
SAMPLE DISTRIBUTION, ACCURACY, AND SIZE

Certainty that the sample mean is within .1 standard deviation of the population mean	No assumption about the distribution of responses	Assume that the responses are normally distributed
90%	1,000	272
95%	2,000	384
99%	10,000	707

TABLE 2
SAMPLE TYPES

<i>Sample Type</i>	<i>Characteristics</i>	<i>Example</i>	<i>When to Use</i>
1. Accidental	Haphazardly drawn, with no consideration given to the population to which generalization will be made.	Going to the street corner and sampling the persons that walk by.	Almost never, only when no alternative seems available. It may be better to have poor data than no data at all. If this method is used, one must keep in mind its lack of representativeness.
2. Quota	Each person in the sample is selected by the interviewer, but he is constrained by rules of inclusion that are determined by the study director. The individual is selected on the basis of some characteristic that he possesses. The number of persons of each type is determined by the study director on the basis of the needs of the analysis. The probability of a person's inclusion is not known.	If someone wanted to compare the attitudes of village headmen with attitudes of the religious leaders in a certain area, he could simply instruct his interviewers to go out and get responses from, say, 30 of each.	A probability sample would be better, since there are some doubts about the representativeness of the sample of the population. It can be used only when the important characteristics are known and fairly easily recognizable. It does not require the population lists or the dwelling-unit maps that are needed for probability sampling.
3. Simple random	Every person in the population has an equal and known probability of being included in the sample.	If there are 100 persons in the population and the sample is of 20 persons, then each individual has a .20 or 1/5 chance of being sampled.	This is the simplest probability design and requires no knowledge of the population other than who the members are. It must be used for inferential statistics and generalization to the whole population.
4. Stratified random	The population is divided on some known characteristic and each portion is sampled on a simple random basis.	If there are in population of 100, 20 wealthy, 60 average, and 20 poor persons, then, in a simple random sample there is too little chance for the wealthy or the poor to be included. If the population were divided and then each segment were sampled separately, enough of the extreme cases would be included for analysis.	When it is known in advance that a special segment of the population would not have enough persons in the sample if the sample were drawn randomly. It also allows the use of inferential statistics.
5. Cluster	The ultimate set of persons is determined by a series of probability samples from increasingly smaller geographic areas.	First a sample of large areas is chosen, then a set of smaller areas from this sample, and so on until the final set of persons is decided upon.	When the population to be sampled is very large. It requires a list of persons or a dwelling-unit map. This sample also allows the use of inferential statistics.

SUMMARY,

In summary, samples are used to gain reasonably accurate knowledge about a population without having to interview every single member. There are several types of samples. First, the *accidental sample* is easy to obtain but can be seriously biased and misleading. Second, the *quota sample* includes predetermined numbers or proportions of different types of persons. The selection of individual persons within each type is left to the interviewer's discretion. Third, the *simple random sample* gives each member of a population a known chance to be selected. Fourth, the *stratified random sample* includes proportions of a population divided on known characteristics in order to not underrepresent any relevant subgroups. Fifth, the *cluster sample* starts with a country or large area and progressively samples smaller areas. Although random samples are generally more accurate, the PSYOP officer with limited time or resources may find it necessary to use the less accurate quota sample. Methods of drawing the samples using population lists and dwelling-unit maps were considered with discussion of field problems. There was also a discussion of cost and accuracy factors that enter into the decision regarding the size of the sample to be used.

Content Analysis

FACTORS INFLUENCING NORTH VIETNAMESE MORALE*

BY the 7TH PSYOP GROUP

Content analysis is illustrated in this article. The technique is used to study the will of Ho Chi Minh and to relate his last testament to psychological factors affecting North Vietnamese morale.

In his last will and testament, executed a few months before his death in September 1969, Ho Chi Minh exhorted his people to continue the fight until the goal of national independence was achieved, until the last foreign troops were driven from Vietnamese soil. To realize this goal, the Vietnamese people are asked to be prepared to continue fighting for another 15 or 20 years, more if necessary.

Prospects of 15 to 20 additional years of war would appear at first examination to be extremely discouraging to a people who have been in

*From "PSYOP Intelligence," a Special Report (SRI-71) of the Research and Analysis Branch of the Research Intelligence Division, 7th PSYOP Group, 11 February 1971.

an almost continual state of war since 1945. Ho's statement appeared to present opportunities to opponents of North Vietnam to mount a psychological campaign against the North Vietnamese. Indeed this seemingly demoralizing pronouncement on the possible duration of the Vietnam War has been seized upon by U.S. and allied propagandists in efforts to weaken the fighting spirit of VC and NVA troops in South Vietnam as well as civilian support of the war effort in North Vietnam.

Ho Chi Minh has been labeled many things by his opponents throughout his long political career, but never a fool. Both the message and the vehicle that conveyed his last admonition were selected for the greatest impact on the North Vietnamese people. Ho Chi Minh was loved and truly venerated by his people almost to the point of being considered a god. The last will and testament was his final formal communication to his people, an expression of what he wanted to be carried out after his death. This testament is constantly referred to in North Vietnamese mass media. The Hanoi leadership effectively invokes the memory of Ho in attempts to motivate the population to greater efforts in all aspects of national life.

In making such a last statement, Ho Chi Minh was drawing heavily upon the Vietnamese past. He was reminding people of the tactics by which the Vietnamese people have won wars throughout history. Usually faced with an enemy vastly superior in strength and arms, as the Chinese or more recently the French, the Vietnamese have traditionally employed the only resources available to them: terrain suitable to their tactics; a brave determined people; and time.

To the Vietnamese the most important of these was time. The Vietnamese have won wars throughout their history by fighting for a longer time than their opponents thought possible. Seven Chinese invasions were successfully repulsed. The Vietnamese struggle with the Mongol hordes lasted 31 years before the Vietnamese drove them from their territory. Wars lasting 30 to 40 years are not uncommon in Vietnamese history. The ability to wage such protracted wars, the tenacity with which the Vietnamese continue to fight, regardless of the time required to defeat the enemy, is the quality with which the Vietnamese people have won their wars.

The Vietnamese people, both North and South, are intensely proud of their history. Until modern times, and with the exception of brief periods of Chinese domination, the Vietnamese have maintained their national independence. They have always maintained their identity as a people regardless of the political situation. Pride in history and military achievements is shown by the manner in which streets in both Vietnams are named. Almost without exception streets are named honoring military and political heroes who have led the people against foreign invaders, usually the Chinese.

Given this apparent ability to outlast the opponent, it is of interest to note Hanoi's thinking about the American people in this regard. A basic

tenet on which Hanoi strategists have based their present war tactics, protracted warfare, is the conviction that the American people are psychologically incapable of staying with a long-term war. The North Vietnamese predicted early in the conflict that the American people would soon tire of the war. The U.S. public would eventually react against rising casualties and rising war costs and force the U.S. government to end the war, thought North Vietnamese strategists.

Accurately gauging the present state of morale in North Vietnam is a difficult task. Government control of the communication media, the small number of visitors permitted in the country, restriction on the travel of the visitors, and particularly the complete absence of unsupervised contacts with ordinary citizens are factors contributing to the scarcity of information.

* * * * *

A French reporter, who traveled extensively in North Vietnam on two different occasions stated that his most vivid impression on the second trip, six weeks after Ho's death, was the absence of change throughout the country. Everywhere he traveled he saw again the same posters seen during the bombing period urging the population to remain war-conscious, warning against any relaxation while the enemy still threatens. Bomb shelters were much in evidence, as were anti-aircraft sites, which were constantly manned. Almost no effort had been made to reconstruct destroyed or damaged buildings although main arteries of transportation were restored or under repair.

* * * * *

The draft in North Vietnam is not popular. However, there is no indication of efforts to avoid conscription. Correspondence from troops outside the country is infrequent, although exploits and resounding victories of Peoples' Liberation Armed Forces of South Vietnam, Laos, and Cambodia are continually related to the population through the mass media.

There is no question that the vast majority of North Vietnamese people want peace. They have suffered much as a result of two decades or more of war. An entire generation has never known peace. Notwithstanding the desire for peace and relief from the hardships borne by the people as a result of the war, there is little evidence to indicate that popular resolve to support the North Vietnamese Government's war policy has been appreciably lessened.

SOCIAL SCIENCE RESEARCH, AND PSYOP, INTRODUCTION PERSUASION*

BY IRVING L. JANIS

An overview of recent research and conceptualization in the field of persuasive communication, a major area of PSYOP.

The art of "winning men's minds by words" has occupied the attention of philosophers since long before the time of Plato's and Aristotle's commentaries on rhetoric. But not until the twentieth century has there been any concerted effort of empirically oriented scholars to describe objectively the conditions under which persuasion succeeds or fails.

Pioneering contributions. In a recent survey of current knowledge about persuasive communication, four social scientists who made pioneering contributions during the first half of this century have been singled out as the founding fathers of the new field of research on persuasive communication (Schramm 1963). One is the political scientist Harold D. Lasswell, who carried out the first detailed descriptive studies of major propaganda campaigns, focusing on the communications issued by national elites during World War I and by totalitarian movements that tried to influence the masses during the period of the great depression. Lasswell formulated a set of theoretical categories for analyzing the effects of persuasive communications and initiated the development of systematic techniques of content analysis (Lasswell et al. 1949).

A second major figure is the sociologist Paul Lazarsfeld, who worked out new methods for investigating the impact of mass media on voting behavior and on the beliefs, judgments, and values of the mass audience. Using poll data from U.S. election campaigns and panel surveys of public reactions to a wide variety of radio programs, Lazarsfeld and his colleagues have described the complex communication networks and cross pressures that exist in modern communities. Their studies (Lazarsfeld et al. 1944; Katz & Lazarsfeld 1955) highlight the influential role of local opinion leaders, who function as "gatekeepers" by promoting or rejecting the evaluative judgments transmitted in the mass media by political parties, business organizations, public welfare authorities, and intellectuals.

A third outstanding contributor to scientific research on social influence is the psychologist Kurt Lewin, whose studies emphasized the powerful barriers to change that are created by the primary and secondary groups with which the individual is affiliated. One of his major

*Excerpts from "Persuasion," *International Encyclopedia of the Social Sciences*, Vol. 12, The Macmillan Company and The Free Press, New York, 1968, pp. 55-63. "Persuasion" by Irving L. Janis. explanatory concepts to account for resistance to new sources of social pressure is the counterpressure arising from the existence of group norms, in which attitudes are anchored. When attempting to understand why a person accepts or rejects a persuasive message, according to Lewin (1947), the investigator should examine the person's anticipations about whether or not he will be diverging from the norms of his reference groups, such as his family, his work group, and the social organizations with which he identifies. . . .

Another psychologist, Carl I. Hovland, is the fourth contributor to have helped build up systematic knowledge about communication effects and the processes of persuasion. Hovland initiated broad programs of experimental research designed to test general hypotheses concerning the factors that determine whether or not the recipients of a persuasive message will be influenced. Some of the studies by Hovland and his collaborators (see, e.g., *Personality and Persuasibility* 1959) bear directly on the hypotheses put forth by Lasswell, Lazarsfeld, and Lewin, while others have led to unexpected discoveries and new theoretical analyses of the psychological processes underlying successful persuasion. . . .

The sections that follow present some of the main generalizations drawn from these and other studies in order to indicate representative hypotheses and empirical findings. . . .

Resistance to persuasion. During recent decades many self-styled experts in propaganda, journalism, advertising, and public relations have promoted an image of modern man as highly gullible. The new field of mass-communications research, which developed from the work of these four pioneering social scientists, has shattered this image along with other popular preconceptions concerning the alleged power of the mass media to manipulate, exploit, or "brainwash" the public. A review of the evidence accumulated from relevant research studies indicates that mass communications generally fail to produce any marked changes in social attitudes or actions (see Klapper 1960). The slight effects produced by the press, films, radio, and television are usually limited to a reinforcement of the pre-existing beliefs and values of the audience. Campaigns designed to persuade people to change their values, to modify social stereotypes, or to foster a new political ideology generally mobilize powerful resistances in the public. So pervasive are these resistances, according to the documented accounts of numerous investigators, that one could characterize "successful persuasion" by the mass media as a relatively rare social phenomenon.

Hovland, Janis, and Kelley (1953), in their analysis of factors that influence attention, comprehension, and acceptance of persuasive messages, call attention to essential differences between educational instruction and persuasion. Most of the differences pertain to the audience's initial expectations, which have a marked influence on motivation to accept or reject the communicator's conclusions. In the case of instruc-

tional communications, where high acceptance is readily elicited, the educational setting is typically one in which the members of the audience anticipate that the communicator is trying to help them, that his conclusions are incontrovertible, and that they will be socially rewarded rather than punished for adhering to his conclusions. In persuasive situations, on the other hand, interfering expectations are aroused, and these operate as resistances. The authors point out that the findings from experiments on communication effects seem to converge upon three types of interfering expectations that operate to decrease the degree of acceptance: (1) expectations of being manipulated by the communicator (e.g., being made a "sucker" by an untrustworthy source, who has ulterior economic or political motives for trying to persuade others to support his position); (2) expectations of being "wrong" (e.g., making incorrect judgments on a controversial political issue or overlooking antithetical evidence that would be grounds for a more cautious or compromise position); and (3) expectations of social disapproval (e.g., from the local community or from a primary group whose norms are not in accord with the communicator's position).

This third type of resistance, which reflects Lewin's "social anchorage" concept, has been most extensively investigated. Many studies indicate that when the members of an audience are exposed to a communication advocating a position that goes counter to the norms of one or more of their reference groups, their resistance will vary directly with the strength of the formal and informal sanctions put forth by the norm-setting group. Quite aside from any special sanctions applied to those who violate the group norms, the mere perception that the vast majority of other members accept a given norm operates as a powerful force on the individual to conform to that norm (Lewin 1947; Asch 1952; Kiesler & Corbin 1965).

DETERMINANTS OF SUCCESSFUL PERSUASION

Most of the substantiated propositions about successful persuasion designate factors that help to decrease psychological resistances when the recipients are exposed to a persuasive communication (see Janis & Smith 1965). Exposure requires not only adequate physical transmission of the message but also audience attention, which will not be elicited if the communication is perceived as deviating markedly from pre-existing attitudes and values or as violating the norms of an important reference group. If a persuasive communication evokes sufficient attention to surmount the exposure hurdle, its success will then depend upon *comprehension* (i.e., the extent to which the audience grasps the essential meanings the communicator intended to convey) and *acceptance* (i.e., the degree to which the audience is convinced by the arguments and/or is responsive to the motivational appeals presented in the communication).

The main types of factors that have been investigated are those specified by Lasswell's classic formula for communications analysis: *Who*

says *what to whom* with *what effect*? Janis and Holvand (1959) present a paradigm of interacting factors that enter into successful persuasion (see Figure 1). Communicator characteristics, the content of the message, the manner of presentation, and other crucial situational factors shown in column 1 are considered to be stimulus variables capable of touching off the key mediating processes (represented in column 3)—attention, comprehension, and acceptance—that give rise to the various effects designated as attitude change (column 4). The magnitude of the influence exerted by the stimulus variables also depends on different types of predispositional variables (represented in column 2).

* The categories and subcategories are not necessarily exhaustive but highlight the major types of stimulus variables that play a role in producing changes in verbalizable attitudes.

Source: Based on Janis and Hovland 1959.

Figure 1—Major factors in persuasion

Communicator and content factors. The most thoroughly investigated propositions bearing on the processes of persuasion are those that specify how one or another of the stimulus attributes is related to successful persuasion. Sometimes communications research has merely confirmed certain of the well-known prescriptions formulated by experts in the art of persuasion. But research occasionally leads to the discovery of unexpected limiting conditions or hitherto unknown relationships that call into question the commonly accepted assumptions about how people can be influenced to change their beliefs or attitudes.

Prestige and "sleeper" effects. Studies of prestige effects have confirmed some "obvious" assumptions and refuted other, equally "obvious" ones. Several communication experiments have shown, as might be expected, that there is an immediate gain in acceptance of persuasive communications when the message is given by someone who is initially accorded relatively high prestige by the audience or when the arguments are attributed to a relatively trustworthy source. But, contrary to expectations, it has been found that in the long run, persuasive communications from low-prestige sources turn out to be just as effective as those from high-prestige sources. This phenomenon has been termed the "sleeper" effect (see Hovland et al. 1953, pp. 254-259; Kelman & Hovland 1953). Both positive and negative prestige effects seem to wear off over a period of several weeks. When a communication comes from a nonprestigious or distrusted source, the audience tends at first to reject the message. But as time goes on, acceptance of the originally discounted statements has been found to *increase*, evidently because with the passage of time, the content of the message is no longer spontaneously associated with the source.

One-sided versus two-sided presentations. Another issue that has been systematically investigated is whether persuasion is more effective when it concentrates exclusively on the arguments supporting the propagandist's position or when it includes discussion of the opposing arguments. Hitler and other Nazi propaganda strategists have claimed that in appealing for a specific line of action, no rival or opposing ideas should ever be mentioned, because they invite comparisons, hesitation, and doubt. But the available evidence indicates that this principle holds true only under very limited conditions, such as when the audience is unaware of the arguments for the other side of the issue. When the audience is strongly opposed to the position being advocated, a persuasive message is generally more effective if it includes the opposing arguments than if it presents only the arguments in favor of one side of the issue (see Hovland et al. 1953, pp. 105-110; Hovland et al. 1949, pp. 201-227; Klapper 1960, pp. 113-116). Moreover, even when the audience is not initially opposed to the communicator's position, a two-sided presentation will be more effective in creating sustained changes in attitudes if the communication is given under conditions where the audience will subsequently be exposed to countercommunications presenting the opposing arguments.

Inoculation devices. When the members of an audience are pre-exposed to the opposing arguments along with some refutations, they are to some extent "inoculated" against subsequent countercommunications, because the new arguments will be much less impressive and more readily discounted (see Lumsdaine & Janis 1953). This type of inoculation has been found to produce a "generalized immunization effect" under certain conditions, notably when a communication advocates recommendations that the audience already regards as being in line with commonly accepted norms, such as simple health rules. Thus, inclusion of a few arguments that momentarily shake the confidence of members of the audience in cultural truisms they had always taken for granted will reduce the chances of their being influenced by subsequent counterpropaganda, because they become more resistant both to the counterarguments specifically mentioned and refuted in the original two-sided communication and to new counterarguments which might otherwise shake their beliefs (McGuire 1961).

Another simple inoculation device has been found to be effective in reducing the influence of unconventional communications that take issue with cultural truisms of the type that people are seldom or never called upon to defend. This device consists of stimulating the members of an audience to build up defenses by warning them in advance that their hitherto unchallenged beliefs will soon be exposed to strong attack (McGuire 1961; 1964; McGuire & Papageorgis 1962).

The well-known "freezing" effects of public commitment to a newly adopted policy or course of action form the basis for another type of communication device that prevents backsliding. Experimental studies indicate that resistance to subsequent countercommunications can be built up if, after presenting impressive arguments and appeals, the communicator uses his persuasive influence to induce his listeners to endorse the position publicly—for example, by voting openly for it, signing a petition, or showing other overt signs of acceptance that will be seen by people in their community (see Lewin 1947; *Attitude Organization and Change* 1960).

Other types of inoculation procedures have been studied to determine the conditions under which acceptance of a new attitude or policy recommendation will be sustained despite subsequent exposure to frustrations, threats, or setbacks that arouse strong negative effects. For example, after having been persuaded to adopt a communicator's recommendations, the audience may subsequently be exposed to warnings or punishments that stimulate avoidance of the recommendations. The emotional impact of the subsequent setback will tend to be reduced if the audience has been given inoculating communications that predict the threatening event in advance, thus eliminating the element of surprise and, at the same time, stimulating appropriate defenses (see Janis 1962). Similarly, in the case of "bad news" events that generate pessimistic expectations about the future, preparatory communications that present grounds for

maintaining optimistic expectations can help soften the blow and enable the audience to resist being unduly influenced by the impact of the disturbance (Janis et al. 1951). In general, the eventual success of any attempt at persuading people to carry out a given course of action is likely to be attained if the communicator frankly discusses the possible subsequent difficulties and countercommunications, presenting them in a way that helps to create a cognitive frame of reference for discounting or minimizing them if they do, in fact, materialize.

Effectiveness of "primacy." Since most inoculation devices involve familiarizing the audience with counterarguments, two-sided communications might be more advantageous in the long run, even in circumstances where a one-sided communication could be expected to be more successful in producing immediate changes in a higher proportion of the audience. There are, of course, many different ways of arranging the opposing arguments in a two-sided communication, and some ways of inserting them have been found to be more effective than others. For example, when the audience is not familiar with the opposing arguments, a two-sided communication from an authoritative source tends to be more effective if the opposing arguments are presented *after*, rather than before, the favorable arguments that support the communicator's conclusion. By giving strong favorable arguments first, the communication arouses the audience's motivation to accept the communicator's conclusion, so that when the negative material subsequently occurs, it can be better tolerated. Furthermore, if a strong case is made for the communicator's position at the outset, there is a greater likelihood that the recipient will make an early decision to accept the communicator's position and thereafter tend to minimize dissonance or conflict by ignoring the opposing ideas (see Brehm & Cohen 1962; Festinger 1957; 1964; Janis 1957; 1959). This *primacy effect*, when tested with communications designed to induce opposing attitudes toward the same social objects or policies, proved to be extremely pronounced under conditions where the contradictory material was not spontaneously salient and there was no time interval between the first set of arguments and the second, contradictory set (Asch 1946; Luchins 1957a; 1957b; Janis & Feierabend 1957). Under other conditions, however, such as where the audience is very familiar with the opposing arguments and has initial doubts about the communicator's honesty, a *recency effect* might predominate, making it more advantageous to give the counterarguments first, with the main affirmative arguments saved for the end of the communication (see Hovland et al. 1957, pp. 130-147.)

Emotional appeals. It is commonly recognized that when a person remains unmoved by repeated attempts to persuade him with rational arguments, he might nevertheless show a marked change as soon as emotional appeals are introduced. Probably the most widespread form of emotional appeal in modern Western culture involves the arousal of fear by emphasizing anticipated threats. Antiwar propaganda, public health

campaigns, and other efforts at mass persuasion frequently rely upon emotional shock devices to motivate people to carry out preventive measures or to support policies designed to avert potential dangers (for example, promoting a ban against a nuclear weapons test by emphasizing the horrors of war). For maximal effectiveness, this device requires not only that the communications succeed in arousing fear but also that the recommendations function as effective *reassurances*. The latter term refers to verbal statements—plans, resolutions, judgments, evaluations—that are capable of alleviating or reducing emotional tension. Many communication experiments have been designed to test popular claims about the effectiveness of emotional appeals and to determine objectively the conditions under which such appeals are successful.

Political leaders and public health authorities often assume that the protective actions or practical solutions they advocate will be more readily accepted, the more they succeed in frightening the audience about the dangerous consequences of failing to adhere to their recommendations. This assumption may occasionally be correct, as in the case of recommendations concerning immediate escape actions (e.g., evacuation of a danger area within a few minutes after an emergency warning is issued). But the assumption appears to be questionable in many instances, especially when the goal is to induce delayed actions or sustained attitudes (e.g., evacuating at some future date, if the threat materializes; supporting a disarmament movement; favoring prodemocratic policies). The available evidence indicates that presenting fear-arousing material in a persuasive communication tends to stimulate the recipient's vigilance and his need for reassurance. But this does not necessarily increase his motivation to accept authoritative recommendations about ways to avert or cope with the danger, since the person may find other ways to reduce his fear. Whenever fear is aroused to a very high level, resistances tend to be strongly mobilized. This will reduce the effectiveness of a persuasive communication, unless it is outweighed by certain other factors that could facilitate attitude change (Hovland et al. 1953, pp. 56-98; Leventhal 1965). Among the facilitating conditions that increase an audience's tolerance for a strong dosage of fear-arousing material in a persuasive message is the inclusion of one or more highly specific recommendations that offer an apparently good solution to the problems posed by the threat, with no obvious loopholes (Leventhal et al. 1965). When this condition is not met, as is often the case in "scare" propaganda, the use of a strong emotional appeal may produce much less acceptance of the communicator's recommendations than a milder appeal, since the audience will then become motivated to attach little importance to the threat or develop some other form of defensive avoidance that enables them to alleviate their fear. Sometimes strong emotional appeals attain spectacular persuasive effects, but it is difficult to predict accurately that a very high dosage of fear will not exceed the optimal level. Preliminary "program assessment" research with cross-sectional samples of the intended

audience is usually needed to make sure that the version of the communication containing a strong appeal is more effective than a version containing a more moderate appeal.

Implicit versus explicit conclusions. Many claims are made about effective strategies for inducing people to change their attitudes and values, but some of these claims are difficult to assess empirically. One such notion is that a *nondirective* approach—similar to that used by many counselors and psychotherapists when dealing with people who seek help in making conflictful decisions of an upsetting nature—will generally be more effective in mass communications than a more directive approach . . . One testable implication of this notion is that a mass communication will sway more people if instead of stating an explicit conclusion, the communicator allows the audience to draw its own conclusions from the facts, arguments, and appeals that he presents. Undoubtedly, there are some circumstances where direct suggestions are likely to meet with such insurmountable resistances that an indirect approach is the only hope for exerting any influence whatsoever. But for informative communications dealing with relatively impersonal issues, the available research evidence indicates that it is generally more effective to state the conclusions or recommendations *explicitly*, even when the propagandist is regarded as biased or untrustworthy (see Hovland et al. 1953, pp. 100-105; Klapper 1960, pp. 84-91, 116-117). One of the main advantages of stating the conclusions explicitly is that it helps to prevent the audience from missing or distorting the essential point of the arguments.

Effects of role playing. One type of indirect persuasion that has been carefully investigated involves the use of a special role-playing technique. It has been repeatedly found that when a person is required to play a role entailing the presentation of a persuasive message to others in his own words, he will be more influenced than if he were passively exposed to the same message. This "saying is believing" tendency has been found to occur even when role playing is artificially induced by asking people to take part in a test of their public-speaking ability or to write essays (Janis & King 1954; Kelman 1953). Experimental evidence indicates that mere repetition of a persuasive message has little effect as compared with an improvised restatement and elaboration of the arguments and conclusions (King & Janis 1956). The success of improvised role playing might be attributed to several different psychological processes. Festinger (1957) suggests that the primary gain from role playing comes from efforts to reduce dissonance between what one is saying publicly and what one actually believes, and a number of experiments offer some supporting evidence (e.g., Brehm & Cohen 1962; Festinger & Carlsmith 1959; Festinger 1964). An alternative explanation is in terms of self-persuasion; when attempting to convey the message to others, the role player is likely to think up new formulations of the arguments, new illustrations and appeals. These are likely to be convincing incentives to himself, especially if he regards the improvised ideas as his "own" (see Hovland et al. 1953,

pp. 228-237; Janis & Gilmore 1965; Elms & Janis 1965). This theoretical issue has not yet been settled, and the differential predictions from the alternative explanations are currently under investigation (see Carlsmith et al. 1966; Rosenberg 1965).

Personality factors. Numerous studies have shown that social attitudes are frequently resistant to persuasion because they satisfy deep-seated personality needs. Such attitudes are likely to remain unchanged unless self-insight techniques or special types of persuasive appeals are used that take account of the adjustive and ego-defensive functions of these attitudes (see Katz & Stotland 1959; Lasswell 1930-1951; Smith et al. 1956). It is logical, therefore, that assessment of personality attributes should help in predicting whether a given person will be responsive to persuasive messages that deal with a particular topic or that employ one or another type of argument. Studies of authoritarian personalities, for example, indicate that any communication fostering rigid, antidemocratic controls over political dissenters and minority out-groups will tend to be more readily accepted by one particular type of personality (see Adorno et al. 1950). An outstanding characteristic of this personality is a strong latent need to displace hostility away from in-groups toward out-groups—as manifested by symptoms of intense ambivalence toward parents, bosses, and other authority figures, combined with a high degree of inhibition of normal sexual and aggressive activities.

Table 1 shows a set of hypothetical diagnostic categories, worked out by Katz (1960), that might prove to be useful for predicting individual differences in responsiveness to persuasion on important social issues. The first step would be to determine which of the four basic types of functions (column 1) is served by the person's current attitude on the issue in question. The type of need fulfilled by each function is shown in the second column of the table. If one could assess the status of these needs accurately, one would presumably be able to predict the types of situations that would arouse the attitude (column 3) and the general conditions that would have to be met in order to change each individual's attitude (column 4).

One of the main reasons why Katz's hypothetical schema is regarded as a promising functional approach to the study of attitude change is that it helps to explain why the conditions required for changing certain attitudes, particularly those diagnosed as serving an ego-defensive function, are not satisfied by the usual forms of persuasion to be found in the mass media. The material in this table carries the implication that no simple psychological formula can be expected to subsume all instances of attitude change. This implication confirms clinical observations, which indicate that unconscious dynamics as well as conscious processes are sometimes involved when a person clings unyieldingly to his stand in the face of strong persuasive arguments or when he readily gives in, without any opposition, on an important social or political issue (see Lasswell 1930-1951). It also agrees with experimental evidence indicating that

even when dealing with conscious attitudes, we cannot expect to find only one type of cognitive process that will account for successful persuasion. For example, the striving for consistency among cognitions bearing on the same issue—which Heider (1958) has postulated as a fundamental human tendency in response to all meaningful communications—sometimes appears to be an important determinant of reactions to persuasion, but it does not account for certain instances where other motivational factors, such as pleasurable anticipations of gain, may become the dominant determinants (see Rosenberg & Abelson 1960).

Individual differences are to be expected, not only in response to persuasive pressures from arguments that create cognitive imbalances but also in response to emotional appeals (see Janis & Feshbach 1954) and group pressures induced by giving information about the consensus of judgments made by one's peers (see Crutchfield 1955); these are called "content-bound" predispositions. Some research evidence also points to specific personality needs, preferences, and sensitivities that predispose certain persons to be highly responsive to one or another limited type of communicator (Janis & Hovland 1959); these are termed "communicator-bound" predispositions. In Figure 1, all such sources of individual differences are represented in the second column by the box labeled "specific predispositions."

In addition to specific types of predispositional factors, there are also certain personality attributes that predispose people to be swayed by, or to be resistant to, *any* persuasive message, irrespective of what is said, how it is said, or who says it. This *general persuasibility* factor (represented by the box at the top of the second column in Figure 1) has been inferred from research on the consistency of individual differences. Such research indicates that when a large audience is exposed to many different types of persuasive communications on many different types of issues, some persons are consistently resistant, whereas others are moderately persuasible, and still others are highly persuasible (see Abelson & Lesser 1959a; Janis & Field 1959a; 1959b). Among the personality factors found to be predictive of low resistance to all forms of persuasive influence are (1) low self-esteem; (2) inhibition of overt aggressive behavior; (3) high fantasy imagery and strong empathic responses to symbolic representations; and (4) other-directed rather than inner-directed orientation, that is, a value system stressing adaptation to the social environment rather than inner standards for regulating one's conduct. It is a puzzling fact, however, that these relationships have been found only in samples of men, since no such relationships have been found as yet in samples of women. These findings have been attributed to differences in the social roles prescribed for women and men in our society, which may also account for the repeated finding that women are more persuasible than men on social and political issues (see Hovland & Janis 1959).

Table 1—Determinants of attitude formation, arousal, and change in relation to type of function

Function	Origin and Dynamics	Arousal Conditions	Change Conditions
Adjustment	The object of the attitude has proved to be useful for satisfying important needs; it increases one's chances of gaining rewards or decreases one's chances of being punished.	1. Activation of needs. 2. Salience of cues associated with need satisfaction.	1. Failure to gain usual satisfactions from the attitude. 2. Creation of new needs and new levels of aspiration that are not satisfied by the attitude. 3. Shifting of rewards and punishments so that the attitude is no longer reinforced. 4. Impressive demonstration of new and better paths for need satisfaction.
Ego defense	The attitude helps to protect the person from internal conflicts or from becoming highly disturbed by external dangers.	1. Posing of threats. 2. Appeals to hatred and repressed impulses. 3. Rise in frustrations. 4. Use of authoritarian suggestion.	1. Removal of threats. 2. Catharsis which reduces the need for defense against pent-up impulses. 3. Opportunity for development of self-insight.
Value expression	The attitude helps the person to maintain his self-identity and his self-esteem; it allows him to express himself or gives him a sense of independence.	1. Salience of cues associated with values. 2. Appeals to individual to reassert self-image. 3. Ambiguities which threaten self concept.	1. Some degree of dissatisfaction with the self. 2. Impressive demonstration of the greater appropriateness of a new attitude for enhancing one's self-image. 3. Loss of usual environmental supports to such an extent that old values are undermined.
Knowledge	The attitude satisfies the needs for understanding, for meaningful cognitive organization, and for consistency and clarity.	1. Re-encounters with the original problem that required a solution or encounters with related problems.	1. Ambiguity created by new information or by a marked change in environment. 2. Meaningful information about a different way of analyzing the problem or about new ways of solving it.

CURRENT STATUS OF RESEARCH

The hypotheses summarized in the foregoing review of social-psychological studies of persuasion do not constitute an exhaustive propositional inventory of all available findings but, rather, serve to highlight major relationships that have emerged from systematic research. Supporting evidence comes from carefully controlled experiments, but the studies usually have been carried out with small subpopulation samples, most often limited to American high school or college students in a classroom situation. Consequently, the generality of the hypotheses and the limiting conditions under which they hold true have not yet been adequately explored. There is some reason to expect, however, that the relationships initially observed in the limited experimental situations will have fairly wide applicability because: (a) they appear to be in line with observations from other, less well-controlled investigations of social influence (such as panel studies of opinion trends during political campaigns, market research surveys on widely advertised products, and case studies of responsiveness to psychological counseling or psychotherapy); and (b) in a number of instances where replications have been carried out with other subpopulations in other types of communication situations, confirmatory evidence has been obtained (see Janis & Smith 1965).

In any case, the development of experimental techniques, attitude scales, and sophisticated methods for analyzing the effects of many different causal factors and their interactions have now reached the point where we can obtain relevant and cumulative knowledge from systematic studies of the conditions under which persuasive communications are effective or ineffective (see Campbell 1963). As new techniques and methods are used in the rapidly expanding field of communications research, we can expect a fuller account of the influence of the variables discussed, as well as new discoveries concerning the ways in which communication stimuli and predispositional factors interact in the processes of persuasion.

ANTHOLOGIES, SYNTHESSES, AND EXPLORATIONS:

AN ATTITUDE CHANGE SAMPLER*

BY GERALD R. MILLER

Social science research on attitude change is particularly relevant to PSYOP. This article reviews the subject of attitude change from several perspectives.

*From "Anthologies, Syntheses, and Explorations," *The Speech Teacher*, XX, no. 1 (January 1971), pp. 78-84. Reprinted with the permission of *The Speech Teacher*, copyright holder, and the courtesy of the author.

As I have indicated in a recent *QJS* (*Quarterly Journal of Speech*) article, the study of human communication, from Aristotle to the analysis of variance, has reflected a pervasive interest in the persuasive process. In particular, the past several decades have produced a printed explosion consisting of both new insights and old ideas revisited—insights and ideas ranging from grandiose theorizing to microscopic empiricism. As Gustav Bergmann would put it, both the “cloudhoppers” and the “clodhoppers” have had their say.

The 14 books reviewed below—all published within the last five years—capture the flavor of this ongoing scholarly dialogue on persuasion. While they represent a collective outpouring of 4008 pages, they do not exhaust the behaviorally-oriented volumes on attitudes and attitude change printed during this time span. Moreover, spatial limitations have necessitated exclusion of two types of works: those which contain considerable material appropriate to the study of attitude change but which deal with other problems as well (e.g., Feldman, ed., *Cognitive Consistency*) and those which note relevant theories and research but which emphasize the practice of persuasive communication (e.g., Minnick, *The Art of Persuasion*).

For purposes of convenience, the books are grouped in three categories, although no claim is made for either their exclusivity or their exhaustiveness. Five of the volumes are *Anthologies*; they are primarily collections of earlier published articles. Four are *Syntheses*; they represent attempts to organize, combine, and present diverse theoretical, empirical, and methodological writings. Finally, five of the works are *Exploratory*; they seek to expand the frontiers of knowledge concerning processes of attitude formation, attitude change, and persuasion.

ANTHOLOGIES

Two of the more ambitious anthologies are Fishbein's *Readings in Attitude Theory and Measurement* and Rosnow and Robinson's *Experiments in Persuasion*. The former contains eight articles dealing with historical foundations of the study of attitudes, 23 concerning various methodological aspects of attitude measurement, and 20 describing differing theories of attitude formation and change. The latter assembles 30 well-known studies dealing with the effects of certain source, message, recipient, and channel variables on the process of persuasion.

Examination of the Fishbein volume impresses the reader with the amount of material that has been written about attitude measurement. Even here, as Fishbein points out, the articles chosen cover only part of the territory; they deal exclusively “with the theory underlying attitude measurement rather than with the measurement process per se.” The classic articles on standardized measurement techniques are all included: the interested reader can discover the genesis of the Bogardus Social Distance Scale; Thurstone and Likert-type scales; Guttman scaling, and the semantic differential. In addition, there are articles dealing with

multidimensional measurement techniques, alternative measurement techniques, and problems and prospects in attitude measurement.

The fact that 21 of the 23 articles deal entirely with scaling and measurement problems which use as their data base some form of paper-and-pencil response is more a commentary on the state of the art than on the representativeness of the selections. The two exceptions are an article by Campbell on the indirect assessment of social attitudes, which takes note of doll-play techniques, and one by Cooper and Pollock, which discusses the use of galvanic skin response to identify prejudicial attitudes. While one or two other articles might conceivably have been included (e.g., Eckard Hess' work with pupillary dilation could not be reprinted due to copyright problems), the conclusion is inescapable that we know much more about measuring verbal indicants of an attitude than we do about measuring other attitudinal behaviors. Elsewhere, I have stressed the need to rectify this shortcoming.

The section dealing with differing theoretical approaches to the study of attitudes strikes an appropriate balance between various strains of theorizing. There are eight articles on consistency theories, an approach that in recent years has undoubtedly spawned the largest research literature. Five of the articles are rooted in behavior theories; while a final section, "Problems, Prospects, and Alternatives in Attitude Theory," not only contains articles presenting the peculiar contributions of such theorists as Bem, Katz, and Kelman but also provides several papers appraising the present status of the most popular theoretical viewpoints.

While Fishbein's volume stresses attitude measurement and attitude theory, Rosnow and Robinson focus on the experimental literature dealing with the persuasive process. The book's organization conforms with Smith, Lasswell, and Casey's famous definition of communication: "*Who* (Source section) says *what* (Message section) to *whom* (Recipient section) through which *medium* (Channel section) with what *effect* (Effects section)." This organizational approach makes generally good sense, with the possible exception of the Effects section. Here, the articles included struck me as a persuasive potpourri covering a variety of problems. Moreover, labeling one section "Effects" is somewhat misleading, for the staple commodity of all five major divisions of the volume is effects-centered research.

Each section contains a number of landmark studies—in some instances, I would have preferred less reliance on the old standards and more attention to research of recent vintage—plus several original summaries, prepared by the editors, of the various research enterprises. These summaries are one of the book's major assets; they produce a sense of unity often lacking in collections of reprinted articles.

Both the Fishbein and Rosnow and Robinson volumes are useful additions to the literature for advanced undergraduate and beginning graduate persuasion courses. Their utility is partially dependent upon experienced instructors, although the original summaries in Rosnow and

Robinson might permit its use by a teacher with less grounding in the behavioral study of persuasion.

Jahoda and Warrent's paperback, *Attitudes*, is an anthology in the fullest sense. Except for a brief introduction and seven one paragraph statements preceding each of the major sections, the book contains no original material. There are 27 classic articles, most of them excerpted, dealing with such topics as the concept of attitude, attitude research, attitude theory, and attitude research methodology.

The volume will make a useful supplement in beginning courses in persuasion or public opinion and propaganda. Its use in advanced classes could contribute to poor scholarly habits, primarily because of the brevity of the excerpts. For example, Campbell's 70 page *tour de force*, "Social Attitudes and Other Acquired Behavioral Dispositions," is represented by a single page. As I recall, such "quickie" summaries used to be eagerly sought out by harried doctoral students preparing for comprehensives. Hopefully, times have changed.

In attempting to produce a volume suitable for unified, indepth undergraduate and graduate study of attitude change, Wagner and Sherwood's *The Study of Attitude Change* juxtaposes theoretical and research articles. Beginning with a well-written introduction by Wagner, the book's general pattern is to present a particular theoretical position, followed by a study generated by that position. While most of the articles are reprinted, there is a good original paper on cognitive dissonance by Sherwood, Barron, and Fitch. To illustrate how results of a given study can be interpreted in more than one way, Bem's elaboration of self-perception as an alternative to cognitive dissonance and Brehm's criticism of Elms and Janis' incentive theory explanation of counter-attitudinal role-playing are included in the volume. Finally, McGuire's article on inducing resistance to persuasion and Howland's classic reconciliation of experimental and survey approaches to the study of attitude change are deemed to be of sufficient general interest to warrant inclusion.

The book's most serious shortcoming is its minimal attention to learning-behavior theories of attitude change. In fact, save for the inclusion of one or two articles, it would have been appropriate to insert the inevitable scholarly colon at the title's end and to have appended a subtitle noting the cognitive theory bias. On the plus side, Wagner and Sherwood's volume, like Rosnow and Robinson's *Experiments in Persuasion*, possesses the virtue of unity. Moreover, the scope of the book permits thorough coverage of its contents in a one-term course in persuasion. On balance, it is a useful addition to the literature.

The last of the five anthologies, Elms' *Role Playing Reward, and Attitude Change* reflects the inevitable outgrowth of constantly increasing specialization in the study of persuasion. All of the 15 articles are concerned with one problem: variables influencing attitude change following an individual's active involvement in counter-attitudinal role-playing. Elms justifies this specialized approach by asserting that "this is an

exciting area of social psychological research. The central issues are not difficult to grasp, and the implications are of broad importance."

For the initiated reader, the controversies are familiar. Beginning with the classic study by Festinger and Carlsmith, the volume captures the continuing debate about the role of justification in inducing attitude change following counterattitudinal role-playing. Both the dissonance theorists—e.g., Cohen and Brehm—and the incentive theorists—e.g., Janis and Gilmore and Elms and Janis—are given their intellectual day in court. In addition, there are articles on the role of relative anonymity and of decision freedom in the process of counterattitudinal advocacy, as well as Bem's familiar interpretation of the process from a self-perception framework.

Obviously, the volume is too narrowly focused for a survey course in behavioral persuasion research. For advanced classes that concentrate on the problem of counterattitudinal role-playing, the book is a valuable instructional asset. Moreover, it effectively demonstrates the theoretical disagreements often accompanying a body of accepted research findings. In all of the articles, the disagreements are not about what is observed, but rather about how to interpret and explain these observations. In fact, skeptical readers may conclude that the book is little more than a scholarly tempest in a teapot, that researchers should be more concerned with their findings and less engrossed with the interpretation of them.

My one general criticism of these five anthologies concerns their redundancy. Three contain some version of McGuire's paper on inducing resistance to persuasion and of Bem's self-perception analysis of the role of justification in counterattitudinal advocacy. Numerous articles are duplicated in at least two of the anthologies. To argue against such repetition is not to detract from the scholarly stature of these popular papers; rather, it represents a pragmatic pitch for maximum availability and coverage. Hopefully, forthcoming collections will result in a better balance of academic supply and demand in the attitude change market.

SYNTHESES

The four books categorized as syntheses differ widely in scope and purpose. Two of the titles suggest primary concern with the critical analysis of theories of attitude formation and change, and the fourth emphasizes practical dimensions of the influence process.

While the Insko volume is titled *Theories of Attitude Change*, its author indicates he is at least equally concerned with summarizing the research literature generated by each of the theoretical positions—that a theory-centered organization of the literature was chosen in preference to a problem-centered approach. Following an introductory chapter that probes some of the problems of attitude research methodology, there are 12 chapters dealing with contemporary theories of attitude change. The book concludes with a brief evaluative chapter on the general historical development of attitude theory and research.

The 12 theory chapters have identical organization: first, the essentials of the theory are presented; next, relevant research is summarized; and finally, the theory's current status is evaluated. The chapters cover reinforcement theory, assimilation-contrast (social judgment) theory, adaptation-level theory, logical-affective consistency theory, congruity theory, belief congruence theory, balance theories, affective-cognitive consistency theory, dissonance theory, psychoanalytic theory, inoculation theory, and several type theories.

The book's strongest point is its comprehensive, detailed summary of the research literature; it provides an excellent synthesis of the work through 1965. For instance, the chapter on dissonance theory—granted, it is one of the longest—contains a 75 page research review. Even though McGuire's recent excellent synthesis in the second edition of the *Handbook of Social Psychology* is more current and wide-ranging, Insko's thoroughness is praiseworthy.

A prevailing ponderous, dry style represents the volume's greatest liability; insomniacs will likely discover that it beats counting sheep hollow. This criticism reflects more than the reactions of a cantankerous reviewer, for I have used the book in a graduate course and numerous students have commented on its dullness. Perhaps Insko's awareness of this characteristic led to his remark that "In describing the research it would have been very easy to summarize and comment upon a group of experiments without going into the details of procedures, statistical tests, etc. Indeed many readers may strongly wish such an approach had been taken. *Certainly this would have made the book more entertaining and readable* (italics mine)."

Whether the objective of detail could have been achieved without such a complete sacrifice of lively style is for the reader to decide. Still, in fairness to Insko, my decision to adopt the book reveals that, for me, its strengths exceed its stylistic shortcomings. One caveat: the book should not be assigned to beginning students not only because the detail may prove formidable but also because it is apt to convince them that the study of persuasion is not much fun.

Keisler, Collins, and Miller attribute *Attitude Change* to their conviction that "very little detailed criticism of individual theories or comparison among the several disparate approaches was available." Certainly, their volume makes considerable headway in eliminating his vacuum; in fact, I was uncertain as to whether it should be categorized as a synthesis or an exploratory work. Final consignment to the *Syntheses* section is, at best, an arbitrary judgment.

The book opens with chapters on the concept and measurement of attitude change. The authors next turn to detailed discussions of stimulus-response and behavioristic theories, consistency theories, dissonance theory, social judgment theory, and functional theories. Although the literature summaries are not as comprehensive as those of Insko, *Attitude Change* is eminently more readable. At times, the book

wanders organizationally; for instance, although the authors offer a lame excuse for its inclusion, the summary of Campbell's paper on acquired behavioral disposition seems out-of-place. Perhaps his position as one of the volume's two patron saints best explains this organizational decision.

One other negative reaction is worth noting. Several of the authors' statements reveal a tendency to conceive of the behavioral study of persuasions as mysticism, rather than science. Consider, for instance, this assertion, which I found particularly perplexing: "Since there is often more to a theory than is publicly recorded, an experimenter 'trained' in a theoretical tradition is probably more likely to replicate than an investigator who must rely on publicly recorded versions of the theory" (p. 65). For my money, this strange view of science—which, unfortunately, seems to be in vogue among disciples of certain research positions—is poor stuff for fledgling persuasion researchers to consume. What "more" is there to a scientific theory than its publicly specified primitives, constructs, logical operators, formal relationships, and bridging principles? Is the invariateness of a scientific law dependent on a particular scientist's intellectual alma mater? Must I have studied with Galileo to replicate his experiments on inclined planes? Obviously, by all rational definitions of science, the answers to these questions are negative. The beauty of scientific method lies in its publicness and reproducibility. If certain experiments fail to meet these criteria, their scholarly advocates should subject them to re-examination, instead of invoking mystical, extra-empirical defenses.

Still, this occasional tendency to rely on nonscientific rebuttal is more than offset by the excellent research summaries and thoughtful criticism accompanying the discussion of the various theories of attitude change. Teachers of advanced undergraduate and beginning graduate courses in persuasion should welcome the addition of *Attitude Change* to the available literature.

Halloran's *Attitude Formation and Change*, written under the auspices of a British Television Research Committee is one of a series of papers investigating "the extent to which the developing techniques of research of the social sciences can be used to examine the influence of television on the formation or altering of attitudes and moral concepts" (p. 7). The book rudimentarily treats such topics as the study of attitudes, their nature, their formation, their functions, and variables influencing attitude change. Numerous landmark studies are cited, and there is a useful appendix by Jahoda acquainting the consumer of research with the steps involved in formulating and investigating a research problem. The volume is neither comprehensive nor current enough for an advanced class, but it could be used in an introductory course.

The final synthetic work, Zimbardo and Ebbesen's *Influencing Attitudes and Changing Behavior*, is unique because of its emphasis on the research utilizer: the communication practitioner whose task is to apply the results of behavioral persuasion research to solving policy questions and developing communication strategies. This does not imply that the

book is of no value to potential researchers, for the authors describe their twofold purpose as follows: "to turn the reader on to the potential value and excitement inherent in the study of attitude change, and to provide the serious student with a primer which may be an impetus to further academic study."

The first five sections of the book closely parallel numerous other volumes reviewed above. The first section discusses approaches to posing problems in attitude and behavior modification, the second deals with available resources for answering these questions, the third examines the experiment as a possible source of information, the fourth provides a framework for critically analyzing attitude research, and the fifth discusses the role of theory in attitude research. In all cases, the material is readable and interesting.

It is primarily in Section 6, "Focusing upon Practical Applications of Principles of Attitude and Behavior Change," that the volume makes its unique contribution. Specific practical problems are posed, and the application of research knowledge to problem solution is then illustrated. For example, a case situation with the intriguing title, "When It's April in Uruguay, Only Science Sells Curtains," first details some of the sales problems faced by an upholstery firm in Montevideo, problems stemming from a conflict between the firm's preferred selling policies and purchasing habits of Montevideo's residents. The next several pages are devoted to a cogent analysis of strategies available to the company, with emphasis placed on the centrality of attitude research in strategy formulation. Repetition of this approach across several case situations convincingly illustrates that research can contribute to the solution of "real world" problems, if ingenuity is used in applying results to these problems.

The book concludes with four *Postscripts*, the most valuable of which details a method for outlining experiments. The interesting mixture of scholarly material and application procedures results in a book of potential utility in a variety of classes ranging from beginning courses for individuals primarily concerned with knowledge utilization. The authors have achieved a balanced, interesting approach.

Taken together, the four synthetic works reviewed provoke several generalizations. First, the interested reader is likely to be impressed by the number of studies conducted in the last 30 years. Moreover, as the volumes ably document, there is no shortage of competing theoretical positions; persuasive outcomes can be explained in various ways. Still, with all the sound and fury, there remains the uncomfortable feeling that we are not very confident about many of our findings and that the parts have yet to be fitted into a satisfactory whole. Perhaps the synthetic volume of a decade hence, buttressed by the kinds of exploratory ventures reviewed in the section below, will assuage this discomfort. Or on the other hand, since the behavioral study of persuasion is an ongoing process, such uncertainty may be a healthy omen.

EXPLORATORY WORKS

The works reviewed above paint a backdrop picturing where the behavioral study of persuasion has been; the volumes reviewed below provide a glimpse of where it is going. Of course, not all of the material found in the five exploratory works is new or revolutionary; obviously, any faltering steps forward must proceed from the groundwork of past accomplishments. Still, numerous fresh insights are contained in these books; insights that may serve as intellectual signposts for behavioral persuasion scholars of the 1970's.

The Greenwald, Brock, and Ostrom volume, *Psychological Foundations of Attitudes*, emerged partially as a reaction to the recent scholarly dominance of consistency theories. The editors assert that "While the cognitive consistency principle has done the valuable service of attracting much attention to the psychological study of attitudes, at the same time this attention has tended to obscure a number of important attitude-theoretical developments that do not make references to the consistency principle."

The book has four major sections: an historical introduction to the development of attitude theory, a section on the contributions of learning-behavior theories to attitude theory, a section on the contributions of cognitive integration theories, and a concluding section dealing with definition of the *attitude* construction. The contributors to the theory chapters interlace explication of the major theoretical propositions with summaries of prior relevant research and suggestions for future inquiry.

Each reader's theoretical biases will dictate his chapter preferences. In the realm of learning-behavior theories, I found the chapters by Staats and by McGuire particularly interesting: the former describes some in-geneous [sic] applications of Hull-Spence learning theory to attitude research, and the later represents an impressive effort to introduce the *systems* concept to the study of attitudes. In the cognitive integration section, Brock's chapter on the implications of commodity theory for value change and Baron's functional analysis of attitude change following counterattitudinal advocacy struck me as especially provocative.

The volume provides a lively stimulus for persuasion researchers and is likely to determine many future empirical thrusts. Instructors of advanced courses who want their students to be on the frontiers of attitude theorizing should read the volume carefully, for there is much to both stimulate and excite.

Two selections deal with the contributions of the Sherifs to attitude theory and research. The first, Sherif, Sherif, and Nebergall's *Attitude and Attitude Change* explicates the social judgment theory of attitude change and reports previously unpublished research bearing on the theory. The chapter headings convey the basic dimensions of, and the critical variables associated with, the social judgment theory. Following a general introduction, there are chapters on latitudes of acceptance and

rejection, ego-involved judgmental priorities, evaluation based on own categories, assimilation and contrast, and the frame of reference for attitude change. The volume concludes with a summary statement about the theory's contemporary status and its relevance to attitude change research.

Attitude, Ego-Involvement, and Change, edited by Sherif and Sherif, contains 13 original papers, four of which are primarily concerned with the social judgment theory of attitude change. The Sherifs present a restatement of the theory, along with some relevant research findings; Diab reports the results of a study comparing social judgment-involvement and semantic differential measurement procedures; Whitaker provides further data on the relevance of social judgment theory to the issue of communicator-communicatee attitude discrepancy, and Bieri examines the relationship between latitude of acceptance—a key construct in the Sherifs' theory—and affective arousal. In addition, there are interesting papers on such topics as attitude formation in children, conceptual systems and attitude change, the components of interpersonal attitudes, and political attitudes of emerging nations.

Those familiar with the Sherifs' writings know that their style is lively and their ideas controversial. Ringing loudly throughout both volumes is a plea for the importance of ego-involvement: for recognizing that in everyday human affairs, certain attitudes are more central and important than others. While a WCTU member may favor both prohibition and ratification of a fishing treaty between the United States and Canada, she is likely to respond differently to communications arguing against implementation of the two policies. If this fact is not recognized, and if researchers concern themselves only with her attitudes toward fishing treaties, the danger exists, as Nebergall has suggested, that we will develop theories of communication dealing only with trivial issues.

Their concern for relevance and importance is doubly manifested in the Sherifs' research: First, they conduct studies on highly ego-involved issues; and second, they rely heavily on field, rather than laboratory experimentation. These procedural preferences led to their 1960 field studies of the presidential election, studies sampling from strongly committed Democrats and Republicans. This research, reported in Sherif, Sherif, and Nebergall, convincingly illustrates the significance of ego-involvement in determining latitudes of acceptance, noncommitment, and rejection for incoming persuasive communications.

To be sure, others have offered criticisms of the method used to measure ego-involvement. Still, the Sherifs have unquestionably put their fingers on an important variable, one that will command much attention in future research. All serious students of persuasion should read these two volumes, for they underscore a dimension of the attitude change problem not widely recognized in other selections.

Rokeach's *Beliefs, Attitudes, and Values* is reviewed in this section with some trepidation, since the volume consists mostly of previously

published papers. Included are chapters on the organization and modification of beliefs, experimental analysis of the organization of belief systems, the effects of race versus shared beliefs in determining social choice, the comparative predictive power of the belief congruence and congruity models, the nature of attitudes, attitude change and behavioral change, and organization and change within value-attitude systems. Finally, there are two appendices: one applying some of the theoretical material to advertising communications and the second exploring some paradoxes of religious belief.

In Chapter 7, Rokeach argues that *value* should replace *attitude* as the central construct for persuasion researchers. This departure from tradition is primarily responsible for my decision to define the book as an exploratory work. Rokeach presents three reasons for his proposed change: First, value is a more dynamic concept than attitude; second, value psychologically encompasses attitude; it is a determinant of both attitude and behavior; and third, since people have fewer values than attitudes, value is a more economical theoretical construct. Rokeach goes on to state that emphasizing values would reduce concern with problems of *persuasion* and heighten interest in problems of *education*.

Whether Rokeach's elevation of the value construct to primary importance marks a significant breakthrough in persuasion research remains to be seen. Certainly, many readers may agree with him that the attitude construct has produced a scientific dead-end, that it is of limited fertility. Other more cautious readers may hold that intellectual infancy, rather than construct inadequacy, best explains the paucity of knowledge about persuasion. Or Rokeach may be over-optimistic, for the same problems plaguing attitude researchers may rear their ugly heads for the value researcher. Whatever one's position on the intellectual issues, his proposed reorientation will likely have practical implications for future persuasion research. Interested students should, therefore, be conversant with his position.

The final book reviewed, Bem's *Beliefs, Attitudes, and Human Affairs*, also defies clear categorization. Although much of the volume's material is synthetic, numerous extended examples both suggest avenues for future research, and as Bem puts it, "make it (the book) unmistakably a personal essay." For instance, a paper—not surprisingly it is coauthored by Bem's wife—"Case Study of a Nonconscious Ideology: Training the Woman to Know Her Place," provides grist for persuasion researchers and the Women's Liberation Front alike. Likewise, the brief discussion of the relevance of determinism to the political preferences of behavioral scientists, while not novel, struck me as both insightful and interesting.

Bem's lively and often humorous style ensure the book's popularity in undergraduate courses in persuasion. But hidden among the colorful adjectives and the amusing quips are many suggestions for potentially fruitful research lines. As a result, more sophisticated readers should also examine the volume carefully.

Lacking omniscience, I cannot predict which, if any, of the five exploratory works will capture the imagination of tomorrow's persuasion researchers or furnish the impetus for major scientific accomplishments. One thing is certain: opportunities for exploration and accomplishment are there for ambitious scholars of persuasion to seize. Hopefully, the books reviewed above will provide them with some of the conceptual, methodological, and empirical tools necessary to expand the frontiers of knowledge about the persuasion process—a process central to man's continued existence and betterment.

BOOKS REVIEWED

- ATTITUDE AND ATTITUDE CHANGE.* By Carolyn W. Sherif, Muzafer Sherif, and Roger Nebergall. Philadelphia: W. B. Saunders Company, 1965; pp. v+264. \$11.45.
- ATTITUDE CHANGE.* By Charles A. Kiesler, Barry, E. Collins, and Norman Miller. New York: John Wiley & Sons, Inc., 1969; pp. vii+386. \$8.95.
- ATTITUDE, EGO-INVOLVEMENT, AND CHANGE.* By Carolyn W. Sherif and Muzafer Sherif. New York: John Wiley & Sons, Inc., 1967; pp. v+316. \$9.95.
- ATTITUDE FORMATION AND CHANGE.* By J. D. Halloran. Leicester, Great Britain: Leicester University Press, 1967; pp. 167. \$4.00.
- ATTITUDE.* By Marie Jahoda and Neil Warren. Baltimore, Maryland: Penguin Books, Inc., 1966; pp. 375. \$1.95.
- BELIEFS, ATTITUDES AND HUMAN AFFAIRS.* By Daryl L. Bem. Belmont, California: Brooks/Cole Publishing Company, 1970; pp. v+114. \$2.25.
- BELIEFS, ATTITUDES AND VALUES.* By Milton Rokeach. San Francisco: Jossey-Bass, Inc., 1968; pp. ix+214. \$6.95.
- EXPERIMENTS IN PERSUASION.* By Ralph L. Rosnow and Edward J. Robinson. New York: Academic Press, Inc., 1967; pp. vii+519. \$8.95.
- INFLUENCING ATTITUDES AND CHANGING BEHAVIOR.* By Philip Zimbardo and Ebbe B. Ebbesen. Reading, Massachusetts: Addison-Wesley Publishing Company, 1969; pp. v+148. \$1.95.
- PSYCHOLOGICAL FOUNDATIONS OF ATTITUDES.* By Anthony G. Greenwald, Timothy C. Brock, and Thomas M. Ostrom. New York: Academic Press, 1968; pp. v+407. \$12.50.
- READINGS IN ATTITUDE THEORY & MEASUREMENT.* By Martin Fishbein. New York: John Wiley & Sons, Inc., 1967; pp. v+499. \$10.95.
- ROLE PLAYING, REWARD, AND ATTITUDE CHANGE.* By Alan C. Elms. New York: Van Nostrand Reinhold Company, 1969; pp. iii+232. \$2.50.
- THE STUDY OF ATTITUDE CHANGE.* By Richard V. Wagner and John L. Sherwood. Belmont, California: Brooks/Cole Publishing Company, 1969; pp. v+213. \$3.25.

A MODEL OF COMMUNICATION EFFECTIVENESS*

BY A. EDWARD FOOTE

An effort to develop a mathematical model of interpersonal and mass media communication effectiveness is described.

Since Shannon and Weaver's [1] introduction of a mathematical theory of communication two decades ago, many speech and communication theorists have acknowledged that it would be beneficial to be able to relate quantitatively the factors that compose the communication process. However, the absence of any simple mathematical model of interpersonal and mass media communication effectiveness is not surprising. Most speech and communication theorists shy away from any commitment to a rigid, quantitative approach to an area with so many nebulous variables; nevertheless, several have hesitatingly explored the applications of such a model. For example, Harrah [2] made a definite contribution with his model, which is based primarily on mathematical set theory, and Cherry [3], Osgood [4], Stephenson [5], and others have recognized the desirability of measurement and quantification of some of the variables that are the determinants of effectiveness.

But a simple mathematical model, which could improve the understanding and prediction of communication effectiveness, has seemed to elude most scholars in the field. Abelson [6] probably provides the best quantitative insight into the relationships among message determinants of effectiveness in a computer simulation model, but even he does not present a symbolic representation of effectiveness. Although Abelson does not develop a desirable codification for effectiveness, his propositions help clarify the direct and inverse mathematical variations. For example, he makes these axiomatic statements:

Individual i will be more apt to accept assertions made by s (sender) the more favorable i 's attitude toward s and the higher i 's receptivity to s .

An assertion is especially apt to be accepted by i if it is consistent with his predisposition toward that assertion, and under no circumstances will be accepted if it runs counter to his predisposition.

An assertion is less apt to be accepted by i if it is inconsistent with his position on the issue.

When i 's attitude toward s is negative and his receptivity to s is very low, assertions made by s not previously encountered by i and not consistent with his position will tend to promote acceptance by i of converse assertions.

The direction of such attitude position change is toward s if i 's attitude toward s was initially positive, and away from s if i 's attitude toward s was initially negative; the degree of such change is a direct function of the difference between the positions of i and s [6].

*Excerpts from "A Model of Communication Effectiveness," *The Journal of Communication*, XX (March 1970), pp. 81-91. Reprinted with the permission of *The Journal of Communication*, copyright holder and the courtesy of the author.

In transferring the dependent and independent variables into information processing language, Abelson has attempted to satisfy four desiderata:

- (1) Influence will be successful (i.e., new assertions will be accepted) under a fairly wide range of conditions, particularly when the influencee has a mild position on the issue but is sufficiently interested to have exposed himself to . . . stimuli.
- (2) However, there are definite resistances to influence, particularly when the influencee has a strong position on the issue and, or a negative attitude toward the communicator.
- (3) If resistances are very strong, there may be a "boomerang effect" whereby the influencee accepts new assertions opposite to those intended and a new position farther away from that of the communicator.
- (4) However, there is some way of influencing almost everybody to some degree [6].

These four criteria and the 49 axiomatic statements were freely consulted in designing the theoretical framework of the proposed model, which mathematically relates the variables of the communication process, including the amount of information, the sender and receiver's places in the social-psychological system both real and preceived, and the effectiveness of the message, in a simple straightforward manner.

The communication represented in the model is restricted to a persuasive message, and the destination of the message must be an individual instead of a machine. A horizontal line, designated AB and composed of many sub-continuums, is used to signify the master continuum on which every person finds himself in relationship to all other people. For example, a sub-continuum $a_1 b_1$ might be considered as the limits of all political positions in this country from "far left" to "far right." Each individual can be placed somewhere on $a_1 b_1$ relative to all others in the population. The political spectrum can then be represented like this:

In every case, a person's position on this hypothetical scale is determined by his socioeconomic status, group memberships, heredity, and all the experiences that go to make each one of us different. If an individual's position relative to others can be placed on a hypothetical scale for politics, it can be placed on a hypothetical scale that stands for degrees of differences from "far left" to "far right" for each possible existing variation affecting our relationship with others. The summation of all these hypothetical scales, each weighted according to its importance in influencing the real position of the receiver, is the continuum AB, which can be stated symbolically as:

$$AB = f_1(a_1, b_1) + f_2(a_2, b_2) + \dots f_n(a_n, b_n).$$

A prospective receiver's position on this line is not static, because the

individual is in a constant state of readjustment of his position. Many of these changes are so minute that they are quite immeasurable with existing methodology. The forces, which must assume a state of equilibrium with respect to the AB component, determine an individual's location on the continuum and are signified by $R_1, R_2, R_3, \dots R_n$. When a state of imbalance exists the receiver will readjust his position until the AB component reaches required equilibrium. Generally speaking, this portion of the model is in agreement with the tradition of the "balance" theorists, including Heider [7], Newcomb [8], and Festinger [9].

The sender's position on the AB continuum is at a point where it is perceived by the receiver. The subject of the message, and in turn the content used to support it, may be two of the strongest influences determining the social and psychological distance, as perceived by Q. Other variables, including the speaker's introduction, his ethos, personality, etc., influence the distance between the real position of the receiver and the perceived position of the sender significantly.

In addition to the horizontal component, each of the forces has a vertical component whose total CD is defined as Q's predispositions on some subject J_k .

As a result of forces $R_1, R_2, R_3, \dots R_n$, there will be predispositions, the CD component, either in the positive direction, in the negative direction, not at all, or in both directions. In reality a CD component probably will not exist for each and every force, since the CD component is present only when the force R_i affects an individual's predispositions on subject J_k . For example, membership in a car pool may have absolutely no effect on religious predispositions, and yet, this same membership may have great effect on political predispositions, depending on the topics of discus-

sion, other group memberships, and a finite number of other variables.

From the model it becomes clear that predispositions are completely independent of the social and psychological distance, because prior attitudes can only be determined by the real position of the receiver, a resultant of the R_n forces. In other words, predispositions are not altered in intensity by the perceived s-p distance from the sender. Since receiver Q cannot move in the CD direction, neither are the predispositions toward subject J_k of opposite signs necessarily equal. Assume that two individuals are located on the scale AB with S the sender and Q the receiver, keeping in mind that the position of S is important only as perceived by Q. Then, assigning the letter Y as the difference on the continuum between the receiver and the perceived position of the sender, the formula becomes:

$$Y = Q - S.$$

Also let us assume that a message of magnitude M is sent by the sender S and received by Q.

This message is either reinforced or depreciated by the resultant of the positive and negative predispositions, and therefore,

$$X = M + P_1 + P_2.$$

P_1 and P_2 are the magnitudes of the positive and negative predispositions.

The positive direction is selected as being in the direction of the intended effect as preceived by the sender. For example, if the sender is attempting to gain votes against a proposed ordinance, the direction remains positive so long as that is the direction of the effect intended by the sender. Likewise, negative dispositions refer to those predispositions whose force is in the direction opposite to the intended effect of the message.

Now, with the relationships among message, predispositions and the sender's perceived location on the continuum defined, it is easy enough to define the effectiveness of the communication M. This effectiveness is the ratio

$$\frac{X}{Y}$$

Since mathematically, $\tan \theta = (X/Y)$ and $\theta = \text{Arctan } (X/Y)$, the degree of effectiveness of a communication is defined as the number of degrees in the angle θ , and the angle θ is referred to as the *Angle of Effect*. The size of the angle results directly from combining quantitatively the factors generally accepted as influencing the effect of the message.

The model can best be represented in this form:

WHERE:

- AB = continuum
- S = sender
- Q = receiver
- θ = angle of effectiveness
- P_1 = predisposition in positive direction
- P_2 = predisposition in negative direction
- X = message plus predispositions
- Y = difference in S and Q on the continuum
- CD = vertical coordinate

NOT SHOWN:

- R_n = forces (see text)
- M = message
- Jk = subject of message

From the model, it immediately becomes apparent why messages directed to other cultures often have little effect. In such cases, the difference between S and Q on the scale AB approaches or may even reach infinity, and regardless of the magnitude of the message M, the communication cannot be effective, since θ approaches 0 as Y approaches infinity. What happens to the effectiveness of the same message on two different receivers, Q_1 and Q_2 ? If Q_1 is located close to the sender on the hypothetical scale AB, and Q_2 is located far away from the sender, the same message will have much greater effect on Q_1 , even when both have equal predispositions. Being dependent on the magnitude of the predispositions, a message will often have a total negative rather than a positive effect. Since

$$X = M + P_1 + P_2,$$

X will take a negative sign and θ will become negative when the magnitude of P_2 is greater than $M + P_1$, resulting in a "boomerang" effect. With an inverse relationship between social-psychological distance and the negative or "boomerang" effect, the size of the angle becomes the number of degrees in the complement angle ($90^\circ - \theta$) and takes a negative

If the message has an effect opposite to that intended by the sender, then the greater the social and psychological distance, the greater will be the *Angle of effect*. A message is incorporated as a force R_n from the sender's beginning assertions; therefore, in addition to its attitude changing strength, the message has a strong influence on the social-psychological distance. With the receiver in constant readjustment of his position and re-evaluation of the s-p distance from the sender, the early portions of a message may well increase this distance and directly reduce its overall effectiveness, or indeed the opposite may occur.

The introduction of this model raises many interesting questions: What units of measurement must be used if the proposed formulae are to be algebraically manipulated? Do overt and covert effect ranges overlap? At what angle does the effect become behavioral? The significance of the model lies in its apparent usefulness for predicting communication effectiveness. Theorists have developed many valid models, but the concept of an *Angle of Effect* is new to communication theory. Obviously the concept is useful in reaching a total Theory of Communication Effectiveness, which can only come after additional discussion.

A model that attempts to relate so many variables in a rigid, mathematical way cannot be completely free of weaknesses and errors; therefore, criticisms are justified. However, with an "anchor point" established, a more refined mathematical model can now evolve, where previously the prospects were limited at best.

THE MEASUREMENT OF SPEAKER CREDIBILITY*

BY R. BARRY FULTON

The author contends that the credibility dimensions of agreeableness, conscientiousness, and culture are positively and significantly related to an independent measure of the attractiveness of a public speaker who is judged only by those overt cues which the listener perceives during the speech act.

Trustworthiness and expertness, the two factors of credibility suggested in 1953 by Hovland, Janis, and Kelley,¹ have been identified more recently in factor analytic studies reported by McCroskey² and by Bowers and Phillips.³ Nevertheless, there are those who insist that this representation of credibility doesn't capture the full complexity of the phenomenon. For example, in a study conducted by Schweitzer and Ginsburg, 28 different factors emerged in the rotated factor matrix for the low-credibility condition, accounting for 74 percent of the variance; under the high-credibility condition, 27 factors accounted for only 60 percent of the variance.⁴ Although Schweitzer and Ginsburg reasonably conclude from this interpretation of their data that the factors of trustworthiness and expertness do not adequately represent the complexity of the concept "credibility," their analysis does little to explicate the underlying relationship.

Lying between the reported extremes are a number of factor analytic studies which appear to systematically represent a greater portion of the complexity involved in a judgment of credibility. Berlo and Lemert reported a factor analysis study in which three dimensions were found: trustworthiness, competence, and dynamism⁵. In addition to these three factors, Whitehead has found a fourth major factor: objectivity.⁶ Norman and his associates have identified five factors in a series of studies which have served as the basis for the research reported here. These five factors along with the scale items used in their measurement are compared in Table 1 to factors found in two of the other studies mentioned above.

The genesis of the dimensions which emerge from any factor analytic study is not an unimportant consideration in their acceptance, for no factor analysis can extract factors which were not represented in the original scale items. The Norman scale items had their origin in Allport and Odbert's search for personality traits in a standard dictionary; in 1936 they reported finding some 18,000 terms. From the 4,504 terms which

*Excerpts from "The Measurement of Speaker Credibility," *The Journal of Communication*, XX (September 1970), pp. 270-279. Reprinted with the permission of *The Journal of Communication*, copyright holder.

Allport described as the "real" traits of personality, Cattell selected 171 terms to represent synonym groups. By means of cluster analysis, Cattell further reduced this number of 36 bipolar pairs from which he has reported finding 12 stable personality factors. Analyses by other researchers have revealed as few as five recurrent factors.⁷

Norman used four scales from each of the five dimensions in a number of studies in which subjects nominated one-third of the members of some peer group on Pole "A" and one-third on Pole "B" of each scale. A varimax rotation of a factor analysis of the data revealed, as hypothesized, five orthogonal personality factors.⁸ In a later study by Passini and Norman, the same five factors emerged with subjects whose contact was limited to being together for less than 15 minutes without opportunity for verbal communications.⁹

Table 1
A Comparison of Hypothesized Dimensions of Credibility

BERLO-LEMERT	NORMAN	McCROSKY
Trustworthiness	Conscientiousness	Character
Just-unjust	Responsible-undependable	
Kind-cruel	Scrupulous-unscrupulous	Honest-dishonest
Admirable-contemptible	Persevering-quitting,	Virtuous-sinful
Honest-dishonest	fickle	Unselfish-selfish
	Fussy, tidy-careless	Friendly-unfriendly
		Nice-awful
	Agreeableness	Pleasant-unpleasant
	Good-natured-irritable	
	Not jealous-jealous	
	Mild-headstrong	
	Cooperative-negativistic	
Competence	Culture	Authoritativeness
Experienced-inexperienced	Intellectual-unreflective,	Qualified-unqualified
Expert-ignorant	narrow	Expert-inexpert
Trained-untrained	Polished, refined-crude,	Informed-uninformed
Competent-incompetent	boorish	Valuable-worthless
	Imaginative-simple, direct	Intelligent-unintelligent
	Artistically sensitive-	Reliable-unreliable
	artistically insensitive	
Dynamism	Extroversion	
	Talkative-silent	
	Frank, open-secretive	
Aggressive-meek	Adventurous-cautious	
Bold-timid	Sociable-reclusive	
Energetic-tired		
Extroverted-introverted	Emotional	
	Stability	
	Poised-nervous, tense	
	Calm-anxious	
	Composed-excitable	
	Non-hypochondriacal-	
	hypochondriacal	

A follow-up analysis by Norman and Goldberg revealed that, even with this minimal contact among subjects, there was some degree of ratee relevance in the choice of scale items. Their explanation for this relevance is based on what Cronbach has termed an "implicit personality theory":

If, for example, it were generally held within the implicit personality theories of these raters that persons who are *irresponsible* and *undependable* are also *careless*, *unscrupulous*, *fickle*, and *slovenly* and if the shared stereotype of the person who is *careless* and *slovenly* included aspects of dress and grooming, then a ratee who gave such an appearance in this setting was, in the absence of more specifically relevant information, apt to be rated as possessing all traits in the set.¹⁰

If the five factors of personality reported by Norman and associates are accepted, it follows that these same factors might operate as underlying dimensions of credibility during the speech act; this proposition is explored in this article.

EXPERIMENT I

Through an analysis of the literature on interpersonal attraction an attempt was made to identify those *credibility cues* which might serve as indicators to a respondent of some set of underlying *credibility dimensions*.¹¹ The suggested pairing follows:

Credibility Dimension
Agreeableness
Conscientiousness
Culture
Extroversion
Emotional stability

Credibility Cue
Disposition, Manner
Dress, Physical bearing
Language
Body type, Delivery
Delivery

Method

Two speakers, undergraduates chosen for their speaking and acting abilities, were trained to represent opposite poles of the five dimensions by speaking and behaving in such a way as to provide for their listeners the cues suggested above. Each of 246 undergraduate subjects heard one of the two speakers deliver (in person) an eight-minute persuasive speech prepared by the experimenter.

The abbreviated scale labels for the 20 items used in the Norman studies were used as labels for opposite ends of 20 semantic differential-type scales. By assigning values of one through seven for each of the responses by subjects and summing for each of the five dimensions, responses to the two speakers could be compared. Subjects also responded to the following two scales: "I feel that I would probably like this person very much" vs. "I feel that I would probably dislike this person very much," and "I believe that I would very much enjoy working with this person in an experiment" vs. "I believe that I would very much dislike working with this person in an experiment."¹² These poles were placed at opposite ends of semantic differential-type scales; responses were scored by assigning values of one through seven and summing as a measure of *attraction*.

Results and Discussion

For each of the dimensions except *agreeableness*, the two groups of subjects differ significantly on their responses to the two speakers. Likewise, the speakers were judged to be significantly different on the measure of *attraction*. The results are summarized in Table 2.

Table 2
Mean Ratings of Attraction and Five Dimensions of Credibility
for Positive (P) and Negative (N) Speakers

Condition	N	Mean	S.D.	t
Attraction				
P	119	9.41	2.37	5.37*
N	127	7.84	2.21	
Agreeableness				
P	119	17.97	3.05	0.88
N	127	17.65	2.70	
Conscientiousness				
P	119	20.41	2.67	11.93*
N	127	15.91	3.20	
Culture				
P	119	20.09	3.06	11.84*
N	127	14.76	3.92	
Extroversion				
P	119	18.39	3.35	5.19*
N	127	15.92	4.07	
Emotional Stability				
P	119	21.19	3.29	7.15*
N	127	17.87	3.93	

* $p < .01$, one-tailed t test.

A multiple correlation analysis was conducted using *attraction* as the dependent variable and five credibility dimensions as independent variables. The following relationship was found to be significant at the .01 level ($F = 4.48$, $df = 3/242$) with a multiple correlation coefficient of .65.

$$\text{Attraction} = .29 \text{ Agreeableness} + .10 \text{ Conscientiousness} \\ + .20 \text{ Culture} - 1.68$$

A second multiple correlation program was run in which the five dimensions of credibility, their inverse, their natural logs, and all pairwise multiples were used as independent variables. The following relationship was also significant at the .01 level ($F = 5.46$, $df = 2/243$); once again, the multiple correlation coefficient was .65.

$$\text{Attraction} = .01 \text{ Agreeableness (Culture} + \\ \frac{1}{2} \text{ Conscientiousness)} + 3.46$$

As both of the equations account for the same amount of variance, the choice between them is rather arbitrary. While the first is simpler be-

cause it expresses a linear relationship, the later is more interesting simply because *agreeableness* appears as a multiplier of the two factors most often cited in the literature on credibility: *competence* and *trustworthiness* (or, as here labeled, *culture* and *conscientiousness*).

It is shown in this analysis that three of the five credibility dimensions are positively and significantly related to an independent measure of the attractiveness of a public speaker who is judged only by those overt cues which the listener perceives during the speech act. One's assessment of interpersonal attraction will change as more information becomes available; this information will in turn interact with existing judgments to modify or reinforce the evaluation of *agreeableness*, *conscientiousness*, and *culture*. Since those additional variables which contribute to attraction (e.g., shared attitudes, propinquity) may be assumed to have been constant among groups in the experimental study, the dependent variable in the equations above is more properly identified as *credibility*, a subset of *attraction*. The following study is an attempt to substantiate the validity of this relationship.

EXPERIMENT II

Using the findings of the previous analysis, a second study was directed at examining the credibility of the seven leading Presidential candidates (November 1967) in terms of the three dimensions which were found to be significantly related to attraction.

Method

As the study described here was used to illustrate and partially validate the means of measurement described above rather than to provide a comprehensive assessment of the credibility of the various candidates, no effort was made to select a sample of some voting population. Instead, 126 undergraduates at the University of Illinois were asked to judge one of the seven men on the 12 scales which represent the three dimensions which were being studied. In addition, each subject was asked to rank the seven candidates in order of his preference for President in 1968. The sample included 59 Republicans, 42 Democrats, and 25 who were Independents or expressed no political preference. In order to balance the analysis, the responses of 17 Republican subjects were randomly discarded; there remained an equal number of Republicans and Democrats in the sample. Responses were made between November 13-21, 1967.

Results and Discussion

The mean ratings for the seven candidates on each of the three dimensions of credibility are represented graphically in Figure 1; each of the dimension evaluations has been normalized to fall within a range of -3 to +3. (The numbers in Figure 1 designate the various candidates by rank order of credibility, represented above in Table 3).

For each of the candidates, the mean ratings on each of the dimensions were used in the following equation to arrive at a quantitative measure of credibility:

$$\text{Credibility} = .01 \text{ Agreeableness (Culture} + \frac{1}{2} \text{ Conscientiousness)} + 3.5$$

The scores for the seven candidates appear in rank order in Table 3.

Figure 1
The Positions of Seven Presidential Candidates on Three Dimensions of Credibility

Table 3
Credibility Scores Calculated by Multiple Regression Equation

Rank	Candidate	Score
1	Percy	10.16
2	Reagan	8.94
3	Kennedy	8.72
4	Rockefeller	8.61
5	Romney	8.38
6	Nixon	8.29
7	Johnson	7.22

A comparison of the rank orders of the credibility scores and the Presidential preference scores revealed a significant ($p < .05$) Spearman correlation of .38. Although this empirical relation may partially validate the methodology, more convincing is a subjective examination of Table 3 and Figure 1. The reader will probably find the results intuitively reasonable for a November 1967 sample of midwestern undergraduates. Because of the insufficiency of the sample in regard to actual voters, a systematic comparison of these findings with nationwide popularity polls could contribute little to the argument being made here.

CONCLUSIONS

Five personality factors were suggested as underlying dimensions of credibility. Three of these dimensions were found to be significantly related to attraction in an experimental study in which two speakers had been trained to represent the opposite poles of the five hypothesized dimensions. The resulting relationship, expressed as a nonlinear regression equation, was used to assess the credibility of the seven leading Presidential candidates among a sample of University of Illinois undergraduates in November, 1967. The analysis was not meant to represent a particular voter group, but instead to illustrate and partially validate the three dimensions—*agreeableness*, *conscientiousness*, and *culture*—and their relationship to *credibility*. While it seems reasonable to suggest that the same three dimensions may be applicable to the study of credibility and interpersonal attraction within a given culture, it seems just as reasonable that the relationship among these dimensions may differ significantly among different subcultures. Nevertheless, a framework is suggested here for the study of credibility and interpersonal attraction which could serve as a basis for theoretical description and further empirical study.

That the dimension of *agreeableness* is significantly related to *credibility* seems to be of some significance in a field of study which has essentially ignored this nonrational dimension. Indeed, without this dimension it becomes impossible to explain the charismatic appeal of some speakers. In summary, the isolation here of three dimensions of credibility provides empirical support for the three constituents of *ethos* suggested by Aristotle: "As for the speakers themselves, the sources of our trust in them are there, for apart from the arguments there are three things that gain our belief, namely, intelligence, character, and good will."¹³

CHAPTER VIII

MEDIA, METHODS, AND TECHNIQUES

INTRODUCTION

After policy objectives and operational goals have been established (see Chapter VI) and at least part of the intelligence requirements have been met (see Chapter VII), difficult decisions about media, methods, and techniques need to be made. These decisions must in large part focus on at least three areas of concern: (1) the selection of the audience; (2) message composition—that is, the preparation, development, and production of the message; and (3) the channels of communication.

Operationally, to achieve a predetermined purpose, the communicator selects a target toward which to direct the message. He develops a theme and writes a message. He then decides on one or more appropriate channels through which to deliver the message, adapting the channels and selecting the time of delivery according to the particular characteristics of the target. Because there are no predetermined intellectual formulas in the preparation and delivery of a PSYOP message or appeal, all of these areas of concern must be carefully considered in each situation faced by the planner. Decisions should be supported by previous experience, but the last two decades have shown clearly that a message or appeal that was highly effective with one target group may not work as well with another. An effective message or appeal communicated by radio may be totally ineffective when communicated by other means. A message or appeal may be more effective with a certain target group when delivered to coincide with a religious or political event, or at a certain time of day or year. When few ordinary channels seem appropriate, the innovative PSYOP planner may fall back on improvised programs or devices, some of which are risky, but may, under the right circumstances, prove effective.

Audience Selection

Broadly speaking, psychological operations is an attempt to influence opinions, attitudes, emotions, and behavior; and in very simple terms, the target or audience is the individual or group of individuals whose attitudes or actions the psyoperator wishes to influence.

The target of psychological operations may encompass an entire society, or it may be made up of a very small and select group of individuals. As part of the total process of planning a PSYOP campaign, the communicator first decides on what changes need to be produced to accomplish the objectives of the campaign. Then he decides which audience in the larger population should be reached and influenced to produce such change, and whether to appeal directly to the target group or through existing channels such as prestigious persons or key communicators.

Because the audience is the key to the desired change, it becomes quite evident that target selection based on a sound understanding of how individuals within the target group think and behave under certain conditions is a critical aspect of PSYOP.

Certain factors in communication related to the psychological and physical set of the population positively or negatively predispose the receptivity of target groups to specific kinds of messages. For example, reference groups play a particularly important role in establishing the delivery circumstances of a PSYOP campaign. Membership in a group requires some commitment on the part of the members, and the success of a psyoperator in drawing an individual away from his group will depend heavily on the kinds of pressures exerted by the group on its individual members. Commitment may be lessened by environmental conditions. In this connection, we have learned from post-World War II experience that the drudgery of jungle warfare in an intolerable conflict situation, where the health and well-being of individuals are threatened, may render them malleable to outside inducements to give up, no matter how highly committed they were previously.

Timing is also an important consideration in the planning of psychological operations. Time of day, time of year—along with the physical and social setting—all contribute in some way to the receptivity of the target group and thus to the success or failure of the campaign.

A proper balancing of these and other factors will depend in large part on the psyoperator's knowledge of the target population. He is not only responsible for determining which group to direct the message or appeal to, but also the most propitious time for doing so.

Message Composition

When planning a PSYOP campaign, a message must be designed to stimulate the desired change in attitudes, opinion, or behavior. Depending on which channel is selected, the message will be composed of spoken or printed words, pictures, sounds, or acts, or a combination of these and perhaps other devices used in PSYOP.

Whatever the techniques used, however, the message or appeal must perform three tasks: it must find, attract the attention of, and be received by, the selected target population; it must be simple enough so that its meaning is understood by the target population; and it must provide enough stimulus to get the target population thinking or behaving in the preplanned direction.

To achieve all of this, the PSYOP planner must give attention to some important factors. Care should be taken with language, where a minor blunder may destroy a well-planned campaign. The planner must pay attention to content so that the message is culturally acceptable, geared to the needs of the reader, balanced in logic and emotion, mainly positive in approach, and consistent with past and future communications. He must attend to style, presentation, and tone so that the message will gain

the respect of the target audience and the planner will gain credibility as a source of information. And finally, the PSYOP planner must have some method of pretesting his messages so that he can determine in advance what effect they will have on the target population. He can do this through area experts, surveys of persons similar to the target population, or use of enemy sources such as defectors and POWs.

Exploitation of Channels of Communication

At the same time, the psyoperator must select the means through which his message or appeal will be conveyed to the target group. Essentially, he must adapt the media to the audience (targeting). Because the target group is the key to the desired change, the media should be selected to suit the target group. Two primary factors limit the range of media choice: the ability of the target group to receive and understand the message and the availability of facilities. In this sense media choice is situationally influenced. The ingenuity of the PSYOP planner in devising unorthodox methods for unusual circumstances may reduce the external controls on media selection, however.

Communication channels may be directed toward targets varying in size from an individual to large groups. Moreover, they may allow simultaneous emission and reception of the message, or its transmission may be delayed. Further, channels of communication may concentrate on any of the senses—sight, hearing, touch, taste—although the choice is usually between printed and audio visual channels.

The choice among the various channels available is often determined actually by the nature of the situation. Formerly, radio was less useful than leaflets in tactical PSYOP. However, technological innovation has made radio-based appeals highly useful in some tactical situations in Vietnam. (See “Earlyword” in this chapter and Colburn B. Lovett, “Effective Combat PSYOP in the Delta,” Chapter VI of this casebook.) Face-to-face PSYOP is conducive to the transference of ideological motivation by revolutionary groups.

Unorthodox Techniques

Very often the PSYOP planner is faced with unusual circumstances where traditional or ordinary PSYOP methods and techniques do not seem to be appropriate or where innovative approaches will have a particularly high pay-off. In situations like this, the planner must depend on his own ingenuity to improvise and develop what may be considered as gimmicky ways of reaching the target group. These devices may be either verbal or nonverbal forms of communicating. The use of gossip and rumor and “black” propaganda are illustrations of the verbal type; symbolic acts, especially fear-arousal acts such as terrorism and saturation bombing, are of the nonverbal type. In any case, their purpose is to arouse an emotional state or a series of memories, which, when touched off, will elicit the desired change in attitude and behavior.

Some of these techniques have been used successfully; others have led to negative results. Controlled gossip, for example, is one of the methods that has been used successfully under the right conditions. Threats and terrorism,¹ or any other kinds of fear-inducing acts, although used successfully in some situations, are potentially dangerous and susceptible to boomerang effects. They have been shown to be of little long term value in changing opinion.

NOTES

¹ See Thomas Perry Thornton, "Terror As a Weapon of Political Agitation," in Chapter VI of this casebook.

AUDIENCE SELECTION

The essays in this section emphasize the need for a proper understanding and selection of target groups in PSYOP campaigns. The lead essay, "Groups and Attitude Change," explains how groups exert pressures on members in a way that tends to generate resistance against persuasive messages and appeals originating from outside the group. "Prestigious Persons and Key Communicators" characterizes the influential persons in a society who function as information "gatekeepers" and opinion leaders with respect to the flow of information. "Reindoctrination Centers" suggests that in some situations the selection of a smaller, more homogenous group is required for effective persuasion. In spite of the effort that may go into selecting a discrete target group for a specifically tailored propaganda message, other groups not intended to be part of the target may also receive the message. Such groups and the problems related to them are discussed in "The Unintended Audience." Consideration of the environmental conditions affecting the receptivity of target groups to PSYOP messages and appeals is the focus of "The Decision to Defect."

GROUPS AND ATTITUDE CHANGE*

BY RICHARD H. ORTH

This essay explores the effects that groups have on the perpetuation of people's attitudes and on their resistance to attitude change. This purpose should be considered within the context of the basic principles of the formation of norms and group needs.

This essay explores the effects that groups have on the perpetuation of people's attitudes and on their resistance to attitude change. This purpose should be considered within the context of the basic principles of the formation of norms and needs of the group.

A person's reference group ** provides his social identity. When he

*Original essay by Richard H. Orth.

**Reference group is a group serving an individual as his frame of reference for self-evaluation and attitude formation (cf. Robert K. Merton, *Social Theory and Social Structure* [New York: The Free Press of Glencoe, 1957]).

asks "Who am I?" or when he is asked "Who are you?", most often the answer will be in terms of his reference group. Thus, overseas he may reply "I am an American," when this reference group is the most salient, that is, the one that is most obviously called upon in the situation. He is just as likely to reply "I am a soldier," if the military is his most salient reference group in the context of the question. Simply stated then, the reference groups provide social identification for the member, even though the particular group that serves as the person's reference varies, depending on which one is most salient at the moment.

GROUP ACHIEVEMENT

A group often helps to achieve some goal. The individual who is a member of the group (sharing the goals of the group) thus benefits from the achievement orientation of the group. For example, a labor union serves its members in gaining economic goals. To the extent that the individual member ties his goals to the achievement of the group, he is reminded of his group membership when these goals are the part of any communication directed at him.

GROUP COHESIVENESS

Another principle of groups and group membership involves the cohesiveness of the group: the more cohesive the group, the more power it has over its members. There are many sources of cohesiveness. For example, a group may be cohesive due to: (1) personal attraction among its members, (2) effective performance in a task, or (3) prestige accrued to individuals by the fact of membership. In any of these cases, the group provides satisfaction for its membership. Because it provides satisfaction, the group takes on the values of the members. The members, then, are really conforming to their own values as embodied by the group.

There is some variation in the degree to which individual members adhere to the values of the group. The member who is confident of his place within the group does not feel as much pressure to conform as one who is not confident of his place. In other words, in order to further benefit from the activities of the group, those individuals who feel that their group position is tenuous strive to solidify their positions by adhering firmly to group norms.

Moreover, when attraction within a group is strong, a favorable disposition toward other members of the group develops. Consequently, members of the group will show more trust and attribute more credibility to each other as sources of information than they will to individuals from outside the group. In the process of changing attitudes or opinions, this means that communicators from inside the group will be more effective in influencing that change than communicators from outside the group.

SOCIAL IDENTIFICATION AND PERSUASION

What does the fact that reference groups provide social identification mean to the process of changing attitudes? Clearly, a person's attitudes are in large part determined by his self-perceptions. He must act and feel in accordance with what he thinks he is. For example, if a man perceives himself to be a soldier, he acts and feels as a soldier, not as a civilian. We have often seen how a soldier out of uniform may temporarily act somewhat differently, but when he is reminded of his reference group, he will quickly revert to the behavior expected of him. This consideration is most important in attempting to change the attitudes of an individual to a point where they are in opposition to those sanctioned by his reference group. One factor that clearly enters the picture here is the salience of the group. As the situation above illustrates, when the salience of the group is low, its effects on the individual are also low. Assuming an individual can be made to forget that the military is his reference group, his attitudes formed as a result of membership in that group will be much more vulnerable to change than they would otherwise. However, manipulating the salience of the individual's group is difficult at best, and hence the PSYOP planner must usually work within the existing framework of group salience.

For example, a labor union often serves as an individual's reference group. His attitudes toward management in industry are guided by the union. In order for that individual's attitudes toward management to change, the union's power over him must decline or the union must cease to be his reference group. If he meets socially with people from management, he may be more likely to express favorable attitudes toward management. Indeed, the farther removed from reminders of his union membership, the more amenable he will be to attitudes contrary to those supported by the union. However, when a reminder of his union appears, it may bring about a multitude of other behaviors congruent with his reference group. He may suddenly begin to recall arguments against management that have been provided him by the union and may begin to use them to counter any management arguments in support of changing attitudes.

DEFENSE MECHANISMS

In addition to providing identity for its members, the group also provides defense mechanisms that aid in the perpetuation of group-centered attitudes. One such mechanism is the counterargument which in effect provides alternatives to the content of appeals persuading members to take on attitudes different from those in support of the group. If an individual is made aware of the fact that he is a member of a labor union, he begins to recall arguments in support of that role, using them to counter anti-union statements. These arguments often do not occur to him in the presence of other union members, or when his identity as a member of this group is not salient to him.

FORCED MEMBERSHIP AND PERSUASION

It should not be assumed from the foregoing that the easiest way to influence an individual is to try to cut him off from the other members of his group. As mentioned previously, an individual whose membership in the group is threatened usually adheres more strongly to the values of that group than members who feel their group position secure. Indeed, members of the group who operate on its periphery, if they value their membership in that group, are usually most adamant about adhering to group values. Furthermore, persuasion that runs counter to group values may be resisted even if membership in the group is compulsory rather than voluntary. For instance, an individual may be a member of a group because the group holds a threat over the individual. That does not mean that the individual enjoys membership, but he may be nonetheless committed to remain a member of the group. Ordinarily, the less an individual is committed—for whatever reasons—to remaining in the group, the more susceptible he is to persuasion that is counter to group-supported attitudes. If he is committed to the group *either* for personal gratification *or* because the group holds a threat over him, then he will be highly resistant to persuasion that is counter to the group's attitude.

In an insurgency environment, this is clearly a problem for the psyoperator. He fully understands that a local population not supportive of an insurgent group in the area should be favorably disposed toward anti-insurgent propaganda. However, so long as the insurgents have control over or are active in an area, the local population may be coerced into some level of commitment and resist persuasion from the outside. In such a situation, it must be demonstrated to the local population that the insurgents do not have the capability to enforce commitment to their side before any successful PSYOP campaign can be launched. Again, this applies to individuals who are not attracted to the insurgent group.

In an environment where group pressures must be overcome, what hope does a psyoperator have of reaching individuals with his persuasion? First of all, he must know at whom to aim his campaigns. Often, there is a temptation to aim campaigns at individuals who are not in the core of the target group. Nothing could be more erroneous. Any argument that goes counter to the attitudes of a group should be aimed primarily at those individuals who are certain of their position. These persons operate with much more freedom than do peripheral members. They are much more innovative and likely to adopt new ideas. Moreover, they spread the more positive new ideas to other members of the group, and, by means of their central position within the group, they exercise a great deal of persuasiveness.

CULTURAL TRUISMS AND PERSUASION

Another factor mentioned above that must be kept in mind is that reemergence of the awareness of group membership will often bring with it recollection of group-supported arguments. These arguments can be

used to counter attempts at persuasion. However, there are some attitudes so universally held in a group that they are never threatened. Consequently, no arguments relating to them are ever presented. These are known as "cultural truisms." An example in American culture is the value of brushing teeth. Since no argument is ever brought up against brushing teeth, no counters to such an argument are readily available. If the psyoperator can locate such universally held attitudes, he may find a fertile area for persuasion campaigns. In this case, the saliency of the group to the individual would not matter.

SUMMARY

Several problems that membership in a group poses for effective persuasion have been discussed without entering into detail concerning the effects different kinds of groups may have on individual members (that is, potential differences between reference groups and membership groups, or between primary groups and secondary groups). It is enough for the psyoperator to be aware of the presence of group pressures on individuals to conform to the norms, values, and attitudes of the groups, and the effect this might have on PSYOP campaigns. Some sources of group pressures were mentioned in the hope that the psyoperator will use these to his benefit. However, many of these forces are interrelated and should be considered in terms of their potential consequences for each other. In the final analysis, it is not that communication will necessarily be ineffective in the face of group pressures. These pressures only require more work to overcome, and they limit the areas in which any effect can be expected.

PRESTIGIOUS PERSONS AND KEY COMMUNICATORS*

BY RICHARD H. ORTH

The prestigious persons and key communicators who are most likely to be perceived as trustworthy and credible communicants in their own social grouping are important in persuasion and may at times be crucial. They are central figures who have a large voice in determining the direction of future attitude trends.

PRESTIGIOUS PERSONS

The basis of difference between the prestigious person and the population on the whole is demographic, that is, the former tends, generally, to be richer, older, and better educated. To locate the prestigious person, a single classification is not sufficient. For example, although prestige is often associated with being a male, this does not mean that in certain cultures *only* males have prestige, nor does it mean that in *all* cultures

*Original essay by Richard H. Orth.

the prestigious persons are males. There societies in which a woman may have high prestige as monarch or prime minister.

Another reason for not classifying persons as prestigious on the basis of one factor alone is the prestige enjoyed by the clergy of most nations. A specific instance of this is shown by the Buddhist monks of certain areas in Asia. Even though these monks do not have any material possessions, they clearly enjoy a great deal of prestige.

It is often said that the community or area leaders are the prestigious persons. While prestige is often associated with leadership, not all prestigious persons have an official designation. This can be thought of in terms of two sets of people in the larger of which are all the prestigious persons and in the smaller, all the leaders in an area:

The figure above indicates that community leadership is a subset of the larger set of the prestigious persons in an area. In other words, to locate the prestigious persons in an area, always consider the factors that are outlined above, and do not stop with merely locating the political leaders.

Thus, although there are certain factors, such as sex, wealth, age, education, and leadership that are generally associated with prestige, these factors should not be taken individually to determine who the prestigious persons are. It is best to take all the factors in combination or to use as many as the situation will permit.

Another method that has been used to locate the prestigious persons is called the *nomination technique*—asking the people in the area who the prestigious people are. In conjunction with this approach, one can also use what is called a self-nomination technique, that is, asking people if they consider themselves to be prestigious persons.

The nomination technique proceeds as follows. One decides on the specific type of prestigious person one wants to locate—for example, political leader or wealthy person. Then, one asks local people about who is the village headman, who is the landowner, who owns the radio, and the like. It might be that a single characteristic will enable them to tell the PSYOP officer who is the person being sought, or it may require a combination of factors. In either case, the PSYOP officer must be aware of the characteristics he is interested in before he tries to locate the prestigious person according to the nomination method. Often several persons may be nominated by an individual, but there should be enough

agreement on one person for the officer to be sure that he is the one being sought.

KEY COMMUNICATORS

The key communicator is more difficult to differentiate from the rest of the society than the prestigious person. In the most general sense, a key communicator is a person who has the function of spreading information to the various segments of the group to which he belongs. More specifically, the characteristics of the key communicator are as follows:

- He is more highly exposed to the mass media and other sources of information and is usually the one who receives the news from the mass media and spreads it to the rest of the group, at the same time interpreting it for them so they can understand it.¹
- He is usually the one who begins the process of popularizing a technological advancement.
- Although found at all social and economic levels, he has a central place in the society. He tends to be socially integrated to a greater degree than most other members of the group; that is, he more closely represents the values of the group. One of his main characteristics is that he tends to be more like the group within which he functions than the prestigious person.
- In the spheres of public affairs, agriculture, and medicine, he tends to be high in socioeconomic status.
- He tends to be well-educated.
- He tends to be young.

There are two types of key communicators: (a) those who have influence in one sphere of influence, and (b) those who have influence in several spheres. In traditional societies, key communicators are more likely to be influential in several areas, whereas in transitional or modern societies the other type is more prevalent.²

Although the key communicator is sometimes referred to as an "opinion leader," one must not confuse him with the innovator, that is, the one who tends to be first in adopting new things. The latter is usually somewhat of a deviate from society, while the key communicator is not. Once an innovation is acceptable, however, the key communicator spreads information about it.

A study of urban Thailand found the key communicators to be, in order of importance: monks; professionals; military officials; and, to a lesser degree, government officials; teachers; and merchants.³ Education was a highly important characteristic of Thai key communicators. Younger persons tended to be more aware of foreign news than older persons. Thai key communicators in general were (1) heavily exposed to the mass media (especially printed media), (2) had responsible roles, and (3) were advice-givers in word-of-mouth communications.

To summarize, the key communicator is generally a frequent user of

the mass media, is better educated, and possesses a central place in the society.

How does one locate key communicators? Three methods of identification have been distinguished: ⁴

1. In the sociometric technique, members of a group are asked to whom they would go for advice or information on a topic;
2. In the key informants method, the surveyor selects persons who appear well-informed and asks them who the key communicators are;
3. In the self-designating technique, a respondent is asked a number of questions that bear on his quality of being a key communicator. In one study, for example, respondents were asked: "In the last six months, were there persons who sought you out in order to discuss their serious problems with you?" and "Are there any persons whom you know who consider you a reliable source of news?" ⁵

DISTINCTIONS BETWEEN THE PRESTIGIOUS PERSON AND THE KEY COMMUNICATOR

It is often important to distinguish between the prestigious person and the key communicator. One source of distinction is the function that each serves in the society with respect to the flow of information. Oftentimes the prestigious person has been called a *gatekeeper*. He decides what is passed on to the ordinary people from a higher echelon than his. For example, in developing nations he may decide for the people which advances they should know about and which ones they should not know about. By controlling the flow of information, he controls the movement and the direction of the movement of the particular society.

In a sense the key communicator also controls the movement of a particular society. However, in the key communicator's function as *opinion leader*, he contributes to the flow rather than the control of information. By the fact that he is integrated into the society, he has a great amount of influence and uses this influence. He is usually considered to be an intermediary between the people and the mass media.

There is a two-step flow between the mass media and the people. ⁶ Although people may have direct access to the mass media, they may still want what is said in the media to be interpreted by the key communicator.

In summary, the two types of persons may be distinguished from each other on the basis of their communicative relationships with the rest of the society. In addition, they may be distinguished on the basis of their degree of social integration in terms of their adherence to the norms of the society. The key communicator more closely represents the values of the group than does the prestigious person. The difference between key communicators and prestigious persons is not always strong, however. Moreover, there are key communicators among the prestigious people just as there are among other groups.

THE PROBLEM OF THE UNINTENDED AUDIENCE*

BY PAUL M.A. LINEBARGER

Despite the best efforts of the communicator, the target of a propaganda message may not always exactly coincide with the actual audience receiving the message; some members of the audience will receive the communicator's message whether he intends them to or not.

One of the continuing problems of mass communications in military situations is that of the unintended audience. The unintended audience can, in one form, come in by listening to radio broadcasts which are not meant for him, by reading our own newspapers and magazines addressed to our home public or our own troops, or even by seeing American movies which have not been edited for specific foreign areas. The other kind of unintended audience can get the American action and words second-hand. Messages originally meant for Americans cross, either in the original English or in translation, into another culture and produce results far from the original utterance. Humor suffers badly in this transition, as it almost always does when transferred from one culture to another. The statement of General Joseph Stilwell, "I claim we took a beating," was meaningless in Chinese, either in a word-to-word translation or in any sort of reasonable context; his statement, which was pleasantly idiomatic and robust for the home audience and for other American soldiers, was weird and inexplicable by the time it reached the unintended audiences.

In a later context, the use of the term "special warfare" by the American Armed Forces in 1961-62 may easily have produced apprehension in the Far Eastern area. "Special" means "secret police," "through bribery and assassination," or by means of espionage"—in the light of the particular use made of the word "special" in the experience of the former Imperial Japanese Army, or in the "special" sections of the Kuomintang party network when it was ruler of the mainland of China. This kind of unintended reaction may be prevented in a few cases. Given a world

*Excerpts from "Essays on Military Psychological Operations," unpublished study, 1965, pp. 52-56.

audience, it is impossible to prevent some misunderstandings from arising. The two most effective defenses against this could be found in:

First, sustained coordination with the Voice of America for the dissemination of acceptable translations of new American terms, slogans, and particular symbols;

Second, clearance through Pentagon level of the approved Army translations into foreign languages, for major audiences at least, of new military terms which may touch unintended audiences in the wrong way.

This problem, while annoying, is less than catastrophic.

The larger problem of "unintended audience" is more serious. *Partial understanding of the United States, taken directly from American channels, can lead to an extreme hostility toward the United States for reasons which are misconceived or merely verbal.* The audience which does not even think that it understands Americans may be animated by a human curiosity or even by an elementary friendliness toward something novel and entertaining. This is the group which believes that it understands Americans, but does so on incorrect conceptions which have been derived from American sources. The fact that the source is itself American makes the misunderstanding so much the harder to cure.

An extreme case of this can be taken from India and Pakistan, both beneficiaries of the United States. The fact that English is the common elite language in each of them makes Indians and Pakistani feel that they already understand Americans. They cannot get much unintended Russian-to-Russian material, because very few of them know enough of the language to intercept intra-Soviet mass communications, whether newspapers, magazines, or radio. America, they are sure they understand—and they are more wrong than right. The word "socialism," has come to India and Pakistan from British English; in their context it means *social welfare* plus a modicum of public ownership, not much more. By their own definition, the United States ought to be recognized as the most "socialist" nation on earth, since our welfare expenditures certainly surpass those of the USSR. But the Americans themselves deny that they are "socialist." This simple twisting of an apparently familiar word puts the Americans in the position, year after year, of seeming to insist that we want our poor suffering, our old suffering, our old starving, our sick neglected or in debt, and our children unprotected. We mean no such thing. The misunderstanding persists and in the case of many Indians and Pakistani, even a visit to the United States does not cure the trouble.

Here the trouble does not lie in translation but in the English itself. There is needed a dictionary of ideas, supplementary to the various country handbooks for which the Army has already contracted, to indicate major sectors of misunderstanding which come from the unexpected eavesdropping of foreign audiences on American-to-American communications. A civic action program will have to de-gauss, as it were, the magnetic fields of rigid misunderstanding which Americans carry with them. The problem, one might hasten to add, is particularly an *American*

one, because—of all the empire-builders and peace-keepers the world has ever known—it is we, more than Macedonians, Romans, Franks, French, or British, who feel the need to be understood and to be liked. The British felt it was enough to be respected and feared. We, in our time carry the neighborliness of our inward traditions with us and insist on making friends with our allies and even with our enemies, once we have conquered them. Much of the resistance to us comes from people who—meeting American friendliness and activity for the first time—mistake it for blood-brotherhood, for an immediate crusade, or for some other element in their own culture. The partially “Americanized” personality is a more formidable, more misleading antagonist than the person who has nothing but Soviet lies on which to base his misconceptions of the United States.

Part of the remedy for this situation would consist of a more careful checking of the foreign press in areas where U.S. forces are stationed, or expected, to make sure *military professionalism* is included in almost every story concerning our trained units. Their home state, their commander’s personality, their marvelous new equipment, their previous assignment—all these are secondary to the critical issue: “Will they fight well, if they must?” Unless this question is answered, and answered very well, the rest of our overseas public relations might as well go by the board.

THE DECISION TO DEFECT*

BY LAWRENCE E. GRINTER

PSYOP planners, particularly in tactical operations, must take into detailed account the physical as well as the psychological environment of the audience so that messages do not require physically impractical responses.

When a member of the Viet Cong decides to break with his old way of life and ask the GVN for amnesty, he must consider the safest way to leave the insurgent organization. In this regard many problems immediately arise. The act of surrender can be very dangerous. If communist cadres realize that a man is wavering toward surrender, they usually take immediate action, such as “reeducation,” imprisonment or worse. Many *hoi chanh* (ralliers) were interviewed who had waited months before slipping away because of the lack of opportunity or the fear of discovery. Even when they did leave the Viet Cong, it could be difficult getting safely into Government areas. The following story seemed typical of the kind of problems that often arose.

One defector explained:

*Excerpts from “Amnesty in South Viet Nam: An Analysis of the Chieu Hoi (Open Arms) Program in the Republic of Viet Nam,” M.A. thesis, University of North Carolina, Chapel Hill, N.C., 1967. Reprinted with the permission of the author, copyright holder.

It is never easy to rally. I walked up to a Popular Force soldier and I told him, "I am a Viet Cong and I want to surrender." He was quite frightened. I did not know how to say *hoi chanh*, so he pulled out a pistol and pointed it at me. I told him to search me, that I wanted to surrender. He wasn't entirely ready to believe me. He went and got a platoon of Popular Force soldiers and they found my buried documents and gun and then they believed me.¹

Another rallier who worked as a communication agent in Phu Yen province was typically pessimistic about the ease of escaping.

There's no generally safe way. Since many Viet Cong have rallied, the VC maintain a much tighter control. Even if you want to go fifty meters away from your unit, you have to inform the squad leader. A Viet Cong can only escape when he goes on a mission to some village.²

One officer, who became a commander of an Armed Propaganda Team in Hue, found that the necessity of producing a Safe Conduct Pass (SCP) to GVN authorities as a guarantee of intentions added to the difficulties of defecting. While it is doubtful that the pass hindered defection more than it aided it, the officer's experience was duplicated time and again during the defection process. For example, a number of *hoi chanh* indicated that they had to hide SCP's in their shirt cuffs or collars, especially when V.C. cadres had just witnessed leaflet drops.

Some *hoi chanh* never were able to defect. For example, in the summer of 1966 in Binh Duong province, forty-one Viet Cong Phu Loi Battalion soldiers were killed in action with safe conduct passes hidden on their bodies.

The decision to defect from the Viet Cong often became a time of agonizing delay. The insurgent was not sure; often he was barraged with feelings of uncertainty and doubt.

I waited for five months before rallying because I was very suspicious. I told no one—not even my children. I was afraid they would talk about it. Finally, I told my wife I could not stay with the Viet Cong any longer. She came with me.³

Another rallier responded this way:

Q. Was it hard for you to rally once you decided to do so?

A. It was two months between the time I decided [to rally] and the time I actually did. The difficulties were the battle in my own mind; for example, I had doubts as to whether the Government would treat me well or not, and I also had trouble because I was so well indoctrinated and had been in the Party so long. I had been in Communist ranks for twenty years and eight months.⁴

When *hoi chanh* did defect, they usually came out alone or sometimes with token help from a relative or friend. This rallier, a Viet Cong village chief, had a plan:

I sent a letter to the Chief of Police in Long An by way of an ex-policeman whom I knew very well, and we specified a place. I went to that place and the Chief sent a policeman to greet me there.⁵

Thus the problem of making the process of defection simpler does not seem to be remediable by the Government. The GVN has broadcast numerous methods whereby ralliers can defect more safely, but in the final instance it all depends upon the rallier and his ingenuity in evading the Communist control system and convincing local GVN authorities he is sincere.

MESSAGE COMPOSITION

The articles below emphasize different aspects of message preparation, development, and production. Simple and obvious themes should be used, appealing to human emotions in a manner congenial to the particular cultures involved in PSYOP campaigns. The effects of appeals showing a favorable attitude toward the audience are illustrated in, "The Soviet 'Peace and Progress' Broadcasts."

The proper idiom, language, and accent are called for in "Brief Observation on the Importance of Up to Date Language in 'Black' or 'Grey' Propaganda." "Films From the Viet Cong" illustrates the point that overemphasis of themes, along with poor production qualities, may fail to arouse the desired emotions among members of the target groups. In "The Viet Cong Slogan Slip" and "Leaflets at a Glance," the view is advanced that short and punchy messages, easily received, visible, and readable, may be more effective with some target groups than more elaborate and expensively produced messages. The importance of offering alternatives to the audience, the mediating qualities of prior communications, and the timing of the communication with certain auspicious events are underscored in "Golden Bridges," "Incitement to Revolt," and "Sihanouk's Appeal to the Monks of Cambodia."

In spite of the precautions taken in the preparation of persuasive political communications material, the effects of psychological operations are apt to be fortuitous and unpredictable. For this reason, message content should be pretested in order to estimate the effects of a PSYWAR campaign in advance.

SELECTION OF THEMES*

BY CARL BERGER

Leaflet messages, particularly in tactical leaflets, should avoid ridicule of the target and use of sophisticated political propaganda themes, and should concentrate on the use of simple messages directed to the target's basic and immediate needs and wants.

*Excerpts from *An Introduction to Wartime Leaflets*, Documentary Study No. 1, The American University, Special Operations Research Office, Washington, D.C., 1959, AD 220 821, pp. 27-33.

In writing or preparing a propaganda leaflet, it is clear that there are no hard-and-fast principles one can follow. The final report of the Psychological Warfare Division, SHAEF, states flatly, "There can be little descriptive material on the subject of how to write a leaflet," and suggests the propagandist simply must stay alert to the changing military picture, must study the intelligence reports on the various target groups, and must be aware of the limitations under which he is operating (that is, his government's policies).¹

However, the leaflet writer should be aware of some general approaches which have proved profitable in the past. For example, there is a recommended approach for appealing to enemy troops in the field. According to Richard Crossman, under these circumstances the whole art of the leaflet "is to appear as a simple, honourable offer by one honourable soldier to another, saying, "You have fought very gallantly; now is the time when you have a perfectly good reason for giving in a little earlier." ² Crossman's view is endorsed by the experiences gained by other Allied propagandists of World War II. The Fifth Army Combat Propaganda Team reported on its experiences against the Germans:

We have learned, partly from the effect of German leaflets on our own troops, partly from other evidence, that hostile, condescending or sarcastic leaflets—no matter how much fun to write—defeat their own purpose. In a war among soldiers, recognition of the enemy's soldierly qualities, credit for bravery, soldier-to-soldier talk (where these matters are pertinent and justifiable) are like butter on bread—they make it swallow easier.³

Similarly, in the Leyte campaign during the liberation of the Philippines, a Seventh Division leaflet writer strongly objected to the sarcastic approach to the Japanese soldiers. "Why," he asked, "should we address them as 'Rats in a Trap' or caricature them as 'Sad Sacks?' These things only infuriate them and provide their officers with something to create unity in trying circumstances and to further their resistance." ⁴ Language specialists with the Seventh Division, who interrogated Japanese prisoners, agreed that American leaflets should include such things as praise for the Japanese soldier for his heroic conduct and a brief statement of the tactical situation, without exaggeration. "Any ridicule of the individual Japanese soldiers," they reported, "belittlement of his equipment, or insulting his leaders was found to create an adverse effect." ⁵

Rule Number One, then appears to be: In a tactical leaflet, ridicule should be avoided and the writer should stick to the military facts. The enemy should be treated as honorable soldiers who are not to blame for the unfavorable circumstances they find themselves in. [Italics added.]

Another general leaflet rule is: The simpler and more direct a leaflet is in language, the more chance it has of being understood by the target audience. Long political harangues would seem to have little place in leaflets. [Italics added.] This is true of both tactical and strategic propaganda. For example, the early British leaflets dropped on Germany in September and October 1939 were made up of long political arguments. One such leaflet stated (excerpts):

German Men and Women: The Government of the Reich has, with cold deliberation, forced war upon Great Britain. It has done so knowing that it must involve mankind in a calamity worse than that of 1914. The assurances of peaceful intentions the Fuehrer gave to you and to the world in April have proved as worthless as his words at the *Sportspalast* last September, when he said, "We have no more territorial claims to make in Europe."

Never before has any government ordered subjects to their death with less excuse. This war is utterly unnecessary. Germany was in no way threatened or deprived of justice.

Was she not allowed to reenter the Rhineland, to achieve the *Anschluss* and to take back the Sudeten German in peace? Neither we nor any other nation would have sought to limit her advance so long as she did not violate independent non-German peoples. . . .

It is not us, but you they have deceived. For years their iron censorship has kept from you truths that even uncivilized peoples know. It has imprisoned your minds in a concentration camp. Otherwise, they would not have dared to misrepresent the combination of peaceful peoples to secure peace as hostile encirclement. . . .⁶

An American travelling by train through Germany in the last months of 1939 reported one German fellow passenger's reaction to the British propaganda: "How foolish it is of the British to think that by their stupid leaflets they can separate the German people from their Fuehrer!"⁷ These early strategic leaflets may have satisfied the soul of the writer, but they had no noticeable effect on the German people. Indeed, in England a story began to make the rounds about the first bombs dropped on Germany, carrying the label: "You are lucky; this might have been a leaflet."⁸ Needless to say, British propaganda quickly took on a more appealing tone.

The Soviets in particular during World War II were addicted to stuffing their leaflets with long political harangues, full of Communist verbiage and Marxist dogma. Many Soviet political officers insisted that the Red leaflets dropped on the German soldiers be "revolutionary," when battle conditions made such ideological leaflets meaningless. Similarly, the Chinese Communists in their leaflets to the American soldiers during the Korean War spoke of "Wall Street imperialists," and the like, to no meaningful purpose. Toward the end of both wars, however, Russian and Chinese leaflets began to improve when the Communists came to understand the necessity of divorcing ideological themes from combat propaganda.

Concerning the subject matter of tactical leaflets, Martin Herz, chief leaflet writer of the Psychological Warfare Division, SHAEF, commented that "there is in most cases no need for sophisticated political propaganda themes. The soldier in battle has a closely restricted horizon. When high explosive shells are bursting around him and he hears our tanks moving up, ideological considerations take a distinctly secondary place in his mind."⁹

At least one enemy soldier of World War II, a Japanese captured on Tinian Island in August 1944, held the same opinion. Questioned by Allied interrogators, this prisoner offered the view that conflicting ideologies of war had little relation to the practical problem of inducing troops to surrender. He said that the Japanese of Tinian treated American leaflets

as a joke; he objected in particular to appeals made on political or ideological grounds (for example, "You have been misled by the military clique"). The Japanese soldier, he reported, was not interested in the crimes of the military caste; he was simply fighting for his country and regarded as nonsense any suggestion that he do otherwise.¹⁰

In general, ideological approaches should be avoided in propaganda aimed at enemy soldiers. In the final report on U.S. Army operations against the Germans in World War I, the writers responsible for the U.S. leaflet operation suggested their rules for future Army leaflets. They should contain simple, accurate statements calculated to suggest the thought of surrender to the average private. In addition, leaflets should take into consideration the condition of enemy morale, the general military situation, and the special character of the enemy unit aimed at. These recommendations may still constitute the best "rules" to follow in the preparation of tactical leaflets.

ONE PAIR OF SHOES*

BY REUBEN S. NATHAN

PSYOP should cater to man's deep psychological needs, his inability to understand the events that create anxiety. It is the task of the psyoperator to lower the level of this anxiety by simple appeals to fundamental human needs.

The most significant sentence I ever found in an interrogation came from a Viet Cong defector, a naive and not overly intelligent fellow, who, when asked why he had defected, said: "You must understand that here

*Original essay by Reuben S. Nathan.

in Vietnam people do not like to be killed. . . .” He reduced many questions to a fundamental human element, an element so pathetically obvious that it is often forgotten.

THE HUMAN EQUATION

The psyoperator seeks the human equation. Only great writers can get at the basics of the human mind. Lesser men need at least a measure of empathy with others, a deep concern with the human condition, and love of one's fellow man to understand what makes him tick. Hatred yields nothing of value—yet, as PSYWAR is usually concerned with enemies, much of PSYOP intelligence is tainted by enmity. How then does one get at the truth on which effective PSYOP must be based? How many sources possess the required empathy with other men, not to mention enemies? How many dare to love in war, to take a chance on being considered weak or ridiculous? It is safer to rely on statistics or on the techniques of public opinion polls—no matter how unreliable. Quantitative approaches are in vogue.

Yet the fact is that the answers to the really important questions lie largely in ourselves. To be effective, PSYOP must appeal to fundamental human emotions. These are the same everywhere: hope and fear; wanting to live; to have a chance, if not for oneself then for one's children. Germans, Poles, Chinese, Cambodians—all fall in love precisely the way we do. People everywhere aspire to the recognition of their dignity.

Kipling was wrong when he claimed that East is East and West is West and that the twain shall never meet. They have met: close to a billion Asians live by the concepts of a white German, Karl Marx, if only because they must. It is true enough that historical, cultural, political, climatic, and other differences exist but they represent a relatively thin layer superimposed on the essential identity of mankind. It is important to know of these differences because they dictate the language one must speak. But it is even more important to realize that these differences matter less than the basic human condition—of which we know because we share it. The American Indians have a prayer: “Grant that I may not criticize my neighbor until I have walked a mile in his mocassins.” An Estimate of the Psychological Situation cannot be too far off if one concludes from one's own emotions about those of the enemy, provided one defines correctly the conditions under which he lives and puts oneself in his mocassins.

SIMPLE AND OBVIOUS THEMES

There are, after all, so many ingredients of our art that are as yet hardly understood. I had a visitor, a senior government officer, FSO (Foreign Service Officer)-1. We had worked together many years before. He read my PSYOP plan for the 1962 Cuban missile crisis and confessed to being disappointed. “When I heard you had been recalled,” he told me,

"I had visions of a truly sophisticated program. Instead you came up with only such simple and obvious themes."

He was quite right. But I was not ashamed of the simplicity of my annex, I was proud of it. In the business of propaganda and PSYOP, simplicity is the apex of sophistication, the result of the most painstaking efforts. This is in fact one of the very few things on which Madison Avenue and PSYOP are in agreement.

It is essential to reduce complex appeals to what I call the terms of one pair of shoes. When our troops entered Auschwitz, one of the Nazi extermination camps, they found two mountains of children's shoes, 600,000 altogether. Photographs of these pitiful monuments to the horror of Nazi barbarism appeared in many newspapers. But what could the readers do? Nobody is capable of facing up to the murder of 300,000 little kids, to the misery of their last hours, alone, terrified, uncomprehending. So one turns the page, has another cup of coffee and tries to forget. But when some time later the press reported that a little boy by the name of Nubby was doomed to die of leukemia and that his parents had decided to give him a last Christmas many months before the real Christmas would come around, tens of thousands of people sent him presents. People can identify with one little child, with one father's and one mother's grief, but not with the fate of hundreds of thousands. That is why good propaganda must talk in terms of one pair of shoes, in terms people can easily understand and accept.

But there are other reasons for the utmost simplicity. The most effective medium of propaganda is face-to-face persuasion. That means that the essential message must be so formulated that it can be projected by great numbers of people—not all of whom are sophisticated enough to communicate involved appeals. Repetition is the mother of propaganda, and who could, or would, repeat complex claims ad infinitum?

I had long before started preaching that the secret of good propaganda is the reduction of the scores of possible appeals, which usually emerge from a sound PSYOP plan, to the smallest possible number of the simplest possible themes. When one finally defines them and puts them on paper, they look very easy, obvious, and unimpressive. That accounted for my friend's criticism and the small regard in which he held my annex. Things like that can hurt one's pride. But then, if "a policeman's lot is not a happy one," that of a conscientious psyoperator is even more trying. We must console ourselves with the feeling that we are trail blazers. We may yet be making the grade. Meanwhile we had better learn to live with the probability that there are no Distinguished Service Medals in our immediate future.

THE SOVIET "PEACE AND PROGRESS" BROADCASTS*

By the 7TH PSYOP GROUP

The receptivity of the audience to a message or appeal may hinge, at least initially, on the perceived attitude of the communicator. A radio broadcast projecting a favorable attitude toward the target audience, depicting the motive to communicate as altruistic, portraying communicator objectives as being in the intellectual and social interest of the target audience, and making no appeals for radical behavior may be viewed by the target audience as congenial communication and should be more favorably received than a neutral or hostile one.

On 1 March, a special broadcast in Mandarin for the "Chinese People" was inaugurated in Moscow. The broadcast is called "Peace and Progress" and is a definite Soviet psychological operation against the present Government of the Chinese People's Republic. The sponsor's appeal to the listeners in inaugurating the "Peace and Progress" broadcast is important and interesting. It spells out Soviet guide-lines and goals for this propaganda action, and gives some idea what Soviet experts on China believe might win over Chinese. For this reason, the entire text of the 1 March broadcast is reproduced here:

We representatives of Soviet mass organizations would like to extend our hand of friendship to you heroic Chinese working class and the glorious millions in the rank and file of Chinese Communist fighters. To the diligent Chinese peasants, we send you our regards and earnest affection.

To our fraternal Chinese younger generation, listen, here is our appeal to you Chinese young men and women: Mao Tse-tung and his clique are attempting to dislodge you from the right track, that is, the revolutionary path.

We also send our regards to the members of the Chinese people's Liberation Army which in the past has always been together with the people and fought for their freedom and happiness.

May our voice also reach you Chinese activists of literature and arts.

This *Peace and Progress* station has been created to express the Russian people's friendship and sense of justice to Chinese friends.

In these programs we shall introduce to you Soviet public opinions toward the undertakings of your country. You shall hear of the Soviet people's growing anxiety and concern for the Chinese people. In our programs we shall voice the opinions of the representatives of the Soviet people, their indignation and denunciation of the attempt by Mao Tse-tung and his clique to undermine the fraternal friendship of the two peoples which was forged with the red blood of their distinguished children shed in the struggle against the common enemy and for their common undertaking.

This station shall alert you to (the) danger of Mao Tse-tung's policy to the Chinese people and the fruits of the Chinese revolution. We shall introduce to you the truth about the events taking place in your country, although Mao Tse-tung and his cronies are attempting to conceal them by keeping mum.

* * * * *

We shall report to you news made available to us concerning the events taking place throughout your great country, and introduce to you materials on Chinese events as reported by mass communication media of other foreign countries,

*Excerpts from "The Soviet 'Peace and Progress' Broadcasts," Communist Propaganda Trends," Issue No. 628 (January 1968), pp. 14-16.

including those of the capitalist countries. You shall be informed of the happiness enjoyed by the enemies, the imperialist countries, as a result of Mao Tse-tung's betrayal and splittist policy. Mao Tse-tung is carrying out an anti-people struggle, splitting the revolutionary anti-imperialist united front, and sabotaging the support for the struggling Vietnamese.

Our station shall invite world Communists and progressive activists to convey to you at length their opinions on the events in your country. All of you shall know that the hearts of all the righteous in the world are with the Chinese people, and all progressive people are unanimously denouncing Mao Tse-tung's policy and his struggle against the socialist states and fraternal parties.

We believe that the voice of our station shall become the symbol of support of the Soviet people and all contemporary revolutionary forces for our Chinese friends, and a symbol of our concern.

We believe that the great Chinese people, under the leadership of China's genuine Communists, will be able to put their country back on the road of friendship and fraternal solidarity with the Soviet and world socialist peoples, and all revolutionary anti-imperialist forces.

Comment: This presents an opportunity to analyze Soviet propaganda efforts aimed at mainland China. The source is of course the USSR. This government-sponsored program probably is the result of a good amount of time and money, in planning and in future projection. It can also be thought, it would seem, that the organization behind this project is the part of the USSR propaganda machine with established intelligence and information channels, the China propaganda section. The source makes no attempt to conceal its identity despite personal attacks on Mao; the program uses what authority the Soviet Government may have to increase its credibility.

The content of this propaganda seeks to establish the source as an all-knowing organization in possession of the "big picture" and true facts about all agents in China. Not only does the "Peace and Progress" station have these facts, it seeks to share them in a friendly manner with the isolated Chinese audience. The content seems aimed at stimulating a normal human thirst for knowledge; for the knowledge-starved mainland China audience "Peace and Progress" promises to utilize communication resources of the Soviet Union to give people the truth that the Chinese Government attempts to conceal. The content reveals the results of Soviet analysis and evaluation of the susceptibilities of the mainland Chinese audience.

While the Soviet propagandists desire to appeal to an entire cross section of the Chinese population, three specific target groups are mentioned: youths, intellectuals, and the army. The selection of these target groups evidently indicates that Soviet propaganda analysts believe these three groups have promise of being susceptible and are effective anti-Mao groups in Chinese Communist society. The People's Liberation Army, "which in the past has always been together with the people and fought for their freedom and happiness," would seem to be a criticism of the PLA's present status.

In summary, "Peace and Progress" might be fairly effective. Even the name "Peace and Progress" was probably derived from a study of Chinese mainland attitudes. . . . The problem is whether wide listener-

ship can be achieved. During this [Cultural Revolution] crisis, and possible future troubles, the Chinese population itself probably becomes the world's greatest "China-watcher" and will welcome information from any source. Possibly, surveillance of foreign radio listeners will be lax. The Soviet Union is trying to exploit this, possibly, and also the world brotherhood of Communism against charges of excesses committed by . . . [Chinese leaders]. Chinese individuals might listen to these broadcasts if they are aware of them and have access to a radio. The "Peace and Progress" project might become a "symbol" for some anti-Government activities, even though this opposition remains Communist.

BRIEF OBSERVATION ON THE IMPORTANCE OF UP TO DATE LANGUAGE IN "BLACK" OR "GREY" PROPAGANDA LEAFLETS*

BY MARTIN F. HERZ

Inattention to language style and usage defeats covert propaganda campaigns.

During World War II the Americans dropped some leaflets on Japanese cities in the form of "Extra" editions of Japanese newspapers. I have two such leaflets in my collection, each headlining bombing attacks. One was supposed to be an extra edition of the Asahi Shimbun, the other of the Osaka Asahi Shimbun. The language of both of them was archaic, and easily determined to be the work of emigrants.

The Asahi Shimbun facsimile leaflet reads as follows in translation: "ANOTHER NATION-WIDE AIR RAID. OUR PRESS CANNOT KEEP SILENT ANY LONGER. The Government authorities may misunderstand our belief which comes from sincere patriotism. Our press may be closed down. But come what may, we consider it our duty as a newspaper to report the truth. THE MILITARISTS CONCEAL THEIR DEFEAT AND THE ANGLO-AMERICAN VICTORY FROM THE EYES OF THE NATION. It has been a well-known fact, even before the war, that the American 'flying fortresses' are capable of bombing our country."

"Our occupied territories in the South Seas do not and cannot serve the purpose of outposts against the American air raids of our country. Our industries will be bombed again all over the country in the near future. EVACUATE THE INDUSTRIAL AREAS. SAVE YOUR INVALUABLE LIFE. The militarists started the war to satisfy their rapacious greed, We cannot remain silent, even if it means the violation of wartime regulations."

*From *Falling Leaf Magazine*, VIII, no. 1 (March 1967), pp. 19-20. Reprinted with the permission of the author and courtesy of *Falling Leaf Magazine*.

Recently I showed this leaflet to a colleague in the Japanese Embassy and asked him to help me in translating it. His observations are given below:

"This leaflet, though its Japanese is excellent, is written predominantly in the style of 'bongobun' (the literary form of the Japanese language) with a slight admixture of 'kogobun' (the oral form). This was the style of Japanese newspapers in the second and third decades of this century. Toward the end of the twenties, they switched completely to 'kogobun.'

"The peculiar and obsolete style of the leaflet is exactly that of the Japanese newspapers published for the American-Japanese community in the States, which was a constant source of amusement to us when I served in Washington. All these papers were edited and published by old 'issei' (first-generation Japanese immigrants) who had been doing small-time local newspaper work in Japan before coming over to the States and who were unable to discard the style to which they were accustomed."

My Japanese friend pointed out, in particular, two words which he regarded as immediate give-aways of the origin of the leaflets. The word air-raid in the leaflet was rendered in Chinese characters as "ku-geki," consisting of "ku" meaning sky and "geki" meaning raid. He commented on this as follows:

"Ku-geki is a perfectly possible combination, but the fact is that we Japanese simply do not use this word. We would have said either 'ku-shu,' meaning air-attack, or 'baku-geki,' meaning bombing attack."

Another instance was the rendering of the term "flying fortress" into Japanese. The writers of the leaflets used "tobu-yosai" (from "tobu" for flying, and "yosai" for fortress). While this was not incorrect linguistically, it simply did not correspond to actual Japanese usage. The term used in Japan was "sora-tobu-yosai," "sora" meaning sky.

The meticulous attention to language in leaflets of all kinds, but the special importance of using the enemy's terminology in "black" or "grey" leaflets, has often been remarked upon. As a former writer of German combat leaflets in World War II, I know that we were guilty of occasional use of incorrect terms also in the European theatre. To avoid this, we often checked our leaflets with cooperative prisoners. To know the enemy's language is not enough; one has to be up-to-date in the latest changes of his spoken word.

Nothing made our American soldiers laugh more, for instance, than the use of the term "doughboys" in some early German propaganda leaflets. Eventually, the Germans realized that the new term was "G.I.," but up to the end of the war there were numerous solecisms in German propaganda leaflets.

FILMS FROM THE VIETCONG*

By PETER GESSNER

The use of films as a propaganda device may lose its impact on an audience because of overemphasized themes and poor production techniques.

Some half-dozen films produced by the National Liberation Front of Vietnam are making their way around the country, shown for the most part in poor screening conditions to limited audiences. . . . Despite the difficulties imposed by a sound track loaded with hyperbole and slogans (the English narrations have all the literary grace of a pamphlet), and despite the deteriorated physical condition of the films which makes many of these screenings little more than mysterious lantern shows, the very existence of these films merits attention.

As a record of the face of the war in Vietnam, and even more as an indication of what the film makers want "us" to know about them, the NLF films are a humbling experience to the viewer. In one (dated 1965), there is a brief sequence in a Vietcong-held village where, during a lull in the fighting, a Western-style ballet is performed within a ring of watching guerrillas. Even the hardened view which says that such things don't happen spontaneously, that they are arranged for the visiting camera, must cope with the fact that these people, the Vietcong, engaged in a brutalizing struggle, have thought it important to include dance in the midst of footage of a vicious guerrilla war.

If this instance indicates that the Vietcong's vision of itself in some sense includes an awareness of the human implications of the kind of war it is forced to fight, its interpretation of events in the United States appears to be filtered through the prism of ideology. For example, one is saddened by repeated references throughout these films to the "progressive American peoples" linked to shots of domestic anti-war demonstrations. Rather than realistically assessing the size and shape of current anti-war sentiment in this country, the film makers seem to have chosen to plug in the appropriate ideological platitude. It may be that, as James Cameron put it in his recent series of articles in *The New York Times*, "too many officials speak an English or French that was actually learned in slogans"; one also suspects that the twenty-year heritage of civil war brings with it a certain hardening of thought, an impatience with the niceties of language and distinction-making.

Once the narration is peeled away, and the images themselves are allowed to live for what they are, the texture of life in Vietnam forces its way through. Another film contains an extended sequence about captured equipment which begins as an apparent ode to self-sufficiency, only to move in a quite unexpected direction. From neatly stacked piles of guns and machinery, the camera turns to people making candleholders from

*Excerpts from "Films from the Vietcong," *The Nation*, 202, no.4 (January 24, 1966) pp. 110-111. Reprinted with the permission of *The Nation*, copyright holder.

what seem to be spent shells, to still others cutting jeep tires into sandal patterns. For a moment, the gulf between these people and a civilization which, even in peacetime, has managed to institutionalize the notion that *things* wear out, seems to loom larger than any logistical speculations about how the Vietcong supply themselves.

Of the six or so films now making the rounds, only one seems to go beyond the momentary revelatory glimpse to create a more whole impact. It was produced, probably by the NLF or a militant wing of the Buddhists, sometime after 1963 (there is no more precise internal evidence), and deals with the wave of demonstrations which followed the Diem government's suppression of the Buddhists.

It begins with what is a prologue of almost abstract battle footage: a montage of swooping planes, machinegun rattles and barbed wire, not unlike Lewis Milestone's *All Quiet on the Western Front*. Abruptly, we are swept into a slow processional of Buddhist priests going out into the streets of Saigon to demonstrate for what, to Americans, would seem to be the most basic of liberties—the freedom to worship. Great bales of barbed wire are unrolled in front of them by soldiers; the younger priests, whose faces strangely recall those of the early civil rights workers in the American South, quietly place their hands around the wire as the soldiers begin to try to cordon them off. A tear-gas grenade lunges across the street, streaming white smoke like some kind of mythic Oriental paper beast.

The Diem soldiers, in camouflaged battle dress and holding shields which resemble the tops of garbage cans and which they seem to use to ward off objects thrown at them by the crowd, begin to move against the priests; at this point, the film takes on the qualities of an ominous pageant play. Oddly incongruous Western symphonic music replaces the English narrator (who with good sense, has kept quiet throughout most of the demonstration sequence), and an unpredictable concordance of sound and image occurs: stock movie music joined with startling images raises the film to an entirely new level, toward a totality of emotion quite difficult to describe precisely. It is one of those rare moments in motion pictures when one plus one equals three. (Something of the sort happens in Luis Bunuel's *Land Without Bread*, a 1932 documentary of an impoverished region in Spain, in which Brahms's *Fourth Symphony* is used throughout the film *not* as a handy contrast but rather in an almost architectual way to provide a vaulting, an unattainable ceiling of emotion which hovers over the sordid level of human action.) Generally, the NLF film makers do not employ music in such ways; the music in other films is of an indeterminate martial nature, used conventionally to fill in behind the narrator.

The Buddhist film, in many ways the most successful of the NLF group, seems to have received less circulation than what is perhaps the most widely seen but unfortunately the least interesting of the lot. This picture, dated 1965 and bearing the title "Foreign Correspondents Visit the

National Liberation Front" (at any rate, something like that), records *Humanité* correspondents Wilfred Burchette and Madeleine Riffaud eating and singing with happy peasants. The film is almost completely uninformative and comes close to being embarrassing—Mlle. Riffaud is more than effuse in her desire to kiss and fondle young Vietcong guerrillas. The quality of the print is mercifully poor and a good portion of all this is practically invisible.

* * * * *

Although the NLF movies draw unexpectedly large audiences (mostly students) wherever they are shown, their net effect is ambiguous at best. They seldom exploit the motion picture as a particular form of communication, nor do they explore the special qualities that set it off from pamphlets or slide shows. The films do not achieve a sense of the camera's own participation in events, a sense present in the footage of volunteer cameramen for the Spanish Republic (*To Die in Madrid*). Judged by the standards we apply to works of art, or even against the more vague measure of some kind of immediacy of feeling, the work is crude and conventional. One responds with something of the suspicion Trotsky felt, perhaps unjustly, for the work of the poet Mayakovsky: "[he] shouts too often where one should speak; and so his cry, where cry is needed, sounds inadequate."

THE VIET CONG SLOGAN SLIP*

By the JUSPAO PLANNING STAFF

The slogan slip, containing short and succinct messages and appeals, has, because of its size, the advantage of being covertly distributed in enemy-held areas.

[One] tool in the Viet Cong communication armory is the slogan slip. This is a small slip of paper (some as small as two by three inches) which contains a short message expressing one idea. The most terse, for example, might read, "Down With the U.S.-Lackey Clique." Use of the slogan slip apparently stems from the experiences gained by the Soviet communists who have raised sloganeering to a high pitch. Of course revolutionaries have for generations used the slogan as a rallying cry, particularly among the less educated. For example, Patrick Henry's "Give Me Liberty or Give Me Death." Or the Loyalist slogan of the Spanish Civil War: "It is better to die on your feet than live on your knees." Or Lenin's cry: "Land to the Tillers." Or almost anything from Madison Avenue.

One of the primary uses for [the] slogan slip by Viet Cong cadres is to help raise revolutionary consciousness. Villagers are encouraged to draft, produce and distribute slogan slips.

*Excerpts from "The Viet Cong Slogan Slip," JUSPAO Memorandum, February 9, 1966.

A captured Viet Cong directive for example declared that:

The slogan is a form of agitation that concentrates the determination of the masses to struggle, expresses the attitudes and actions of the masses to make revolution, and lowers the prestige and power of the enemy . . . They are of three types: those which praise our policies; those which express hatred especially for enemy crimes; and those which support the *binh van* proselyting movement.

It went on to say that slogans could be written on paper, on wood panels, carved into tree trunks and also lettered on walls or on large banners to be hung across roads leading into villages. The directive added:

Slogans may be written in the form of poetry, in verses of six or eight words, or in the form of words to popular songs. . . But all slogans must be written in serious and dignified form and not scrawled. Many slogans now used are disorderly. These must be improved. The masses must be taught to write slogans properly, hang them in public places, and protect them from enemy soldiers during clearing operations.

The directive gave an example of villagers protecting their slogan:

In one village the people wrote slogans on the bark of tree trunks. The enemy soldiers came to the village and saw the slogans on the tree and said, "We think we should cut down these trees with those offending words." The people replied to them: "If the Liberation soldiers had written the slogans on bridges would you blow up the bridges?" The soldiers were forced by this logic to withdraw, without cutting down the trees.

Slogan slips are generally distributed covertly. They are slipped into women's shopping baskets at markets, tossed in parked vehicles in the cities, placed at night in school room desks or simply scattered along paths and walks where they are apt to be found by pedestrians.

A . . . study . . . of 144 slogan slips, collected at random from throughout the country, indicates both the priority of audiences currently maintained by the Viet Cong as well as a general overview of current themes.

As far as language was concerned the vast majority of the slogan slips, about 90 percent, were in Vietnamese, with Montagnard dialects and English following in that order. The largest single target for the slogan slip was the general rural population; fifty percent were omnidirectional. The largest single target was members of ARVN, with Montagnards, youth, specifically rural, civil servants, Americans and Hoa Hao.

More than two thirds of the total number of slogan slips were devoted to two themes: support for the Viet Cong effort and proselyting of military and civil servants; these ranked about 40 percent and 30 percent respectively. Then came anti-U.S. themes of 12 percent (although anti-U.S. themes appeared as secondary themes in a majority of the sample), followed by 15 other themes of less than three percent each.

LEAFLETS AT A GLANCE

BY the EDITORS

Bold lettered leaflets were used in Vietnam to gain the attention of an audience in a rigidly controlled environment.

Even the most carefully designed message satisfying well-known effectiveness criteria such as comprehension and appeal may be a wasted effort. An essential condition for effective communication is that the attention of the audience is secured. In the case of printed matter, the minimal condition is that the message at least be seen; the desired effect is that the audience also read the message.

Seeing a message is no problem if the targeting is accurate; reading it, on the other hand, may constitute a grave danger to the recipients if the audience is in a controlled environment. For example, leaders of Axis and Communist forces in World War II, Korea, and Vietnam imposed severe penalties for reading Allied propaganda. Interviews with captured North Vietnamese and Viet Cong prisoners as well as captured enemy documents revealed that the reading of Allied propaganda could lead to harsh punishment, and possession of such leaflets could even mean death. Quite understandably, then, many of those disenchanted with their conditions were fearful of being caught by their leaders reading or possessing Allied leaflets.

A major problem facing psyoperators in Vietnam, as well as in earlier conflicts, was how to induce cadres in enemy ranks to read a message in an environment that was rigidly controlled. Allied psyoperators tried many techniques to overcome enemy countermeasures, and certainly one of the most interesting of these was "Leaflets-at-a-Glance" material. They were printed in bold letters so that they could be read from a distance with minimal danger to the audience. Of course, leaflets of this type are usually not suitable for directive purposes in a controlled environment; they are clumsy to carry or hide. They can, however, lower morale by reinforcing existing feelings of suspicion or duress. Moreover, "Leaflets-at-a-Glance" can fulfill a specific informational objective such as indicating where to look for or hide other Allied messages.

GOLDEN BRIDGES*

BY REUBEN S. NATHAN

Because one of the important elements of PSYOP is offering options, the absence of reasonable alternatives in the content of the communicator's message is counterproductive: in a conflict situation, for instance, it often leaves the target audience little choice but to rally behind parties against whom the communicator was directing his message, whether they want to or not.

*Original essay by Reuben S. Nathan.

One of the main objectives of propaganda in times of war is to build Golden Bridges, to persuade the enemy that there is a way out, that there is no need to fight to the end. Leaving room for maneuver does not mean abandoning national objectives. War aims at changing governments, at eliminating hostile regimes which resist an equitable peace. People are eternal—they will be there after they and their governments have been defeated; they will continue to live and must be lived with. That is why good propaganda must see to it that they are not cornered, for cornered people will fight and kill until they die, and the people they kill will be one's own.

WORLD WAR II

We sensed at the time of the Casablanca conference—and we now know this supposition was correct—that the demand for unconditional surrender would make it next to impossible for the Germans opposing Hitler to overthrow him. They had nothing to offer to the people, no expectation that they would be able to negotiate an acceptable compromise.

Deprived of the opportunity to build Golden Bridges by the call for unconditional surrender, the Allied propagandists of World War II were severely limited in potential effectiveness. The war would be decided by guns; words that might conceivably have shortened it and so saved lives, had been disarmed.

According to Robert E. Sherwood's *Roosevelt and Hopkins*¹, President Roosevelt told his aide "We had so much trouble getting those two French generals [Giraud and de Gaulle] together that I thought to myself that this was as difficult as arranging the meeting of Grant and Lee—and then suddenly, the press conference was on, and Winston and I had had no time to prepare for it, and the thought popped into my mind that they had called Grant 'Old Unconditional Surrender,' and the next thing I knew I had said it."

In other words, the most important PSYWAR decision of World War II had not been the result of deliberate PSYWAR thinking. It had just "popped" into the President's mind. Admittedly, there were very few PSYWAR experts on the Allied side, apparently none on the staff of any of the leaders who met at Casablanca. One wonders whether Hitler would have made an equally momentous decision without consulting with Dr. Goebbels. One need not wonder what Stalin would have done for that is a matter of record. When the armies of the Soviet Union entered Germany, Ilja Ehrenburg's blunt anti-German line was abruptly dropped. Soviet propaganda instead proclaimed that Moscow had been fighting the Nazis but was aware that Nazis come and go and that the German people would remain—to be lived with. Soviet propaganda did not go in for brainstorms. Totalitarian propaganda seldom does. It relies on experts.

NORTH VIETNAM

Less than ten years ago we faced a similar situation in the decision to bomb North Vietnam. We know² that the first strikes were ordered in retaliation for attacks on U.S. barracks in Pleiku, and the following

"sustained reprisals" in response to increasing Viet Cong violence and direct North Vietnamese involvement in the war. The situation in South Vietnam was deteriorating; a close advisor to the president felt that defeat was "inevitable" unless the United States put pressure on Hanoi. If there was any reference to psychological considerations, they came from former President Eisenhower who did not think that air strikes against the North could prevent the North Vietnamese from infiltrating men and supplies in to the South, but who seemed to feel that they would help South Vietnamese morale.

There is no mention that U.S. Information Agency directors attempted to present the case for psychological operations. Yet, there was a case to be made. It is possible that it should have been overruled for compelling military and political reasons, and probable that it would have been overruled, but it had sufficient merits to be taken into consideration.

First, we had, at least theoretically, an excellent opportunity to demoralize North Vietnamese troops fighting in South Vietnam. They had had a very hard time getting to South Vietnam. Presumably, many of them were tired and ill. They were cut off from their families, not even permitted to write home or receive letters, and their lines of resupply were tenuous. They had been told that they would fight imperialist American aggressors but there were not many Americans in Vietnam in the Spring and Summer of 1965, and they found themselves fighting other Vietnamese. Many of them may not have understood why. They were, in sum, tailor-made targets for PSYWAR, the operator's wishdream.

Bombing North Vietnam changed that. Suddenly all North Vietnamese soldiers in South Vietnam had a reason to fight, a reason any one of them could understand. The Americans were threatening the lives, limbs, and homes of their families. Fathers, husbands, brothers, sons began to have a personal stake in the war.

Second, the air strikes put an end to any hopes to divide the people of North Vietnam at home. It is axiomatic that there is no such thing as a permanently united nation. Even the most fanatic totalitarian governments face a domestic opposition—voiceless, it is true, but opposition nevertheless. We might have strengthened that opposition by making people question the wisdom of Hanoi's warring in South Vietnam—the casualties, the draft, the cost, the sacrifices, the austerity. But it is also axiomatic that bombing attacks make people rally behind their government whether they like it or not. There is nowhere else to look for leadership and protection. The British were never as united as they were behind Winston Churchill while German bombers, buzzbombs, and rockets threatened their lives. Yet only a few months after the threat had ended, they repudiated the man who had united them. They returned to "normalcy," division, and opposition. It is interesting to note that the termination of the bombing campaign against North Vietnam immediately created problems for Hanoi. French and Canadian reporters related them: black-marketeering, indifference of youth, goldbricking, a

slackening of disciplined production. Hanoi was forced, time and again, to remind the people that the war was still on and that they had duties.

Nobody can say whether we would have succeeded in demoralizing North Vietnamese troops or in driving wedges between the people and the government of North Vietnam; the point is that there was a chance to do so, that this chance might have weakened Hanoi significantly, and that the bombing of North Vietnam deprived us of that chance. It follows that the case should at least have been given a hearing. We had no such hearing in Casablanca, during the Cuban Missile Crisis, or when the decision to bomb North Vietnam was made. This must change if the enormous capabilities of PSYWAR are to come into their own.

SIHANOUK'S APPEAL TO THE MONKS OF CAMBODIA*

By the 7TH PSYOP GROUP

Because the success of PSYOP depends heavily on the receptivity of the target audience, a good sense of timing and skill in exploiting an opportunity become important elements in the delivery of a message or appeal.

Peking NCNA International carried a message from Prince Norodom Sihanouk to the Khmer Buddhist monks on September 17th. In his message [one of four] he asked the monks of Cambodia to join him in his struggle to regain his throne.

The gist of his message was designed to impress upon the Buddhist monks their duty to stand on the side of the city poor, the exploited workers, and the peasants rather than with people who "have sold the country to U.S. neo-colonialism." In this regard, he felt that the Lon Nol group did not deserve support from monks because of the manner in which it took over the reigns of government.

In order to oppose this neo-colonialist undertaking of the Americans, [Sihanouk continued,] it is necessary for the people of Asia to reconcile with one another, unite and fight together, regardless of their beliefs and ideology. It is absolutely wrong to distinguish believers from atheists, non-Communist from Communist. For the safety, freedom and independence of our Asian countries, it is necessary for us to create a union and solidarity among all the Asians determined to fight for an Asia free from imperialism and neo-colonialism. It is necessary for us to expose the renegades in Asia and to fight against those who, prompted by ambitions and personal interests, serve the unjustifiable cause of U.S. imperialism.

In the next portion of Sihanouk's message he points out five cases in which people with seemingly good paying jobs and happy families have

*Excerpted and adapted from "Sihanouk's Appeal to the Monks of Cambodia," "Communist Propaganda Highlights: Trends and Analysis," Issue No. 41-70 (9 October 1970), pp. 41-4-41-9.

left their jobs and family to join him. According to Sihanouk these people now have only very modest pay but feel they are working for a good cause. "In one case," Sihanouk said, "those students living abroad who agree to support Lon Nol have received big rewards (some have even been given 300 U.S. dollars each). In Europe, the student members of the National United Front of Kampuchea (NUFK) remain poor. They lack money, and sometimes they have only one meal a day."

Let our monks and Samdech, head of the sect, take pains to ask themselves why all these young and old patriots agree to such sacrifices and such hardships. Let them ask themselves why our citizens of the provinces, young and old, men and women, yesterday in hundreds and today in thousands, agree spontaneously to leave their houses, rice fields, farmland, livestock and carts, etc., in order to join the people's heroes Khieu Samphan Hu Nim, and Hou Youn in the jungle.

* * * * *

In this regard, I would like to state precisely for our Buddhist monks that first, the said Communist states of Eastern Europe have not given their official recognition to the Lon Nol government which was born of the coup of last 18 Mar; secondly, some of these very European Communist states have recognized officially, while others admitted publicly, that Nordom Sihanouk remains the legal head of state of Cambodia; thirdly, the political parties, the people's fronts, and the people of these very countries have officially given their recognition to the NUFK as the only representative of the Khmer people and have time and again and most expressly affirmed their support to our people and their NUFK in our struggle against U.S. imperialism and its lackeys and for national salvation and the liberation of the Khmer motherland; fourthly, the refusal by certain European Communist governments to recognize the RGNUK by no means signifies that they support or like the regime of Lon Nol.

This refusal might be explained by certain interests of their own of these governments. This should lead our Buddhist monks to think over the policies, attitudes, maneuvers, and actions of certain powers in Asia which seem unwilling to see the Asians become complete masters of the destinies of their Asia and of their Asian countries.

* * * * *

Therefore, [said Sihanouk in closing,] if our Buddhist monks and Samdech, head of the sect, like our nation, agree to look these realities straight in the face, I am sure that they will not fail to march on the just roads towards a future which would not be in contradiction to the national ideals of pure patriotism, peoples democracy and genuine freedom.

Comment: Sihanouk broadcast his speeches at a time when the people were about to observe their oldest and most significant Buddhist ceremony, the Festival of the Dead. Offerings of food and garments are made to the monks during the first 15 days of the tenth lunar month. The reasoning behind the broadcast of the speeches at this time is that the monks have a great deal of influence on the people and many of them probably have not lost all loyalty to Sihanouk. He knows that if he can possibly get the support of the monks at this time, he would also keep the support of a large majority of the people.

The four speeches, employing kaleidoscopic verbosity, suggest that the people come back to the pure and simple life. He appears to be trying to sway the Khmer by explaining that others in seemingly good paying jobs have given up everything to support him, hoping that the monks and their followers might heed the advice and actions of these people and join him. Sihanouk would like the Khmer to think if they do not join him they will be dishonoring the Kingdom of Cambodia and the sacred Buddha.

There are several points of view about Sihanouk and the Buddhists. Some say the Buddhist clergy no longer are charmed by Sihanouk and thus would be unlikely to try to persuade their followers. Others believe that Sihanouk still has a pretty strong hold on the Buddhist clergy and, through them, on the people.

THE FAMOUS "MIG" LEAFLET*

BY CARL BERGER

Subsequent results of messages will not always be predictable; it is therefore incumbent upon the communicator to scrutinize messages carefully and attempt to detect the potential for unintended effects, both positive and negative.

Occasionally, a special leaflet operation will produce important side effects. This was the case with the special offer made by the U.N. Command in April and May 1953, an offer of \$50,000 to any Communist pilot who would deliver a MIG jet fighter or other modern Soviet jet to the United Nations forces in Korea. An additional bonus of \$50,000 was promised the first pilot to bring in a plane.

The offer was disseminated by airdrops of special leaflets written in Korean, Chinese, and Russian. In addition, the offer was carried in these languages over the U.N. radio network. Both the leaflet and radio media gave detailed flight plans whereby Communist pilots could bring in planes safely under escort by U.N. fighters.

Not until several weeks after the July 1953 Armistice in Korea, did a North Korean jet pilot zoom out of the skies, land at Kimpo airfield near Seoul, and ask for political asylum. The pilot said he had never heard of the jet offer, but since American truthfulness was at stake, the U.S. Air Force paid the pilot the \$100,000 reward and the offer was withdrawn. But this was not the whole story. General Mark Clark, U.N. Commander, later reported that the Air Force not only got its \$100,000 worth in information from tests on the Russian jet, but the operation had had important military side effects.

According to Clark, the Communists' first reaction to the offer

was to ground all MIGs for eight days. It might have been because of the weather, or because they wanted time to screen out the politically unreliable pilots. Most likely, it was the latter. An eight-day break in MIG operations in Korea was most unusual. . . . For whatever reason, the Communist MIG pilots who were permitted to fly after the offer was made were the worst—on their record—of the whole Korean War. They flew far fewer missions in those last ninety days than in the preceding three months, but American Sabrejet pilots shot down twice as many planes. In fact, the Sabres destroyed 165 MIGs against three friendly combat losses—a record ratio of 55 to one.¹

Conceding that the pilots knew of the offer—and Communist reactions appear to grant that point—here was an instance of a measurably successful psychological operation.

*Excerpts from *An Introduction to Wartime Leaflets*, Documentary Study No. 1, The American University, Special Operations Research Office, Washington, D.C., 1959, AD 220 821, pp. 74-76.

Since 1953 this type of leaflet operation has been used by the Chinese Nationalists, who have dropped leaflets over the Communist mainland, offering Red pilots who defected to Taiwan with MIG planes from 1,000 to 4,000 ounces of gold, depending on the model plane they brought in. As far as is known, no Chinese Communist pilots have taken advantage of the offer. The Nationalists also have scattered leaflets offering Chinese Communist naval personnel up to 100,000 ounces of gold (\$3,500,000) if they brought in a light cruiser.

NOTES

PRETESTING THE PRODUCT*

BY WILBUR SCHRAMM

Pretesting the content of propaganda messages to assess in advance their potential impact on an audience will increase the chances of their being effective.

The problem in all types of psywar operations is to predict or estimate the effect of a psywar operation without being able to measure freely the actual responses of the target audience.

There are, in general, three ways to evaluate the effect of a psywar product in this difficult situation. Admittedly each one is only an approximation. None of them is as satisfactory as an uninhibited study of the target audience itself would be. Yet an evaluation of what psywar is accomplishing is so enormously important to planning and practice that any psywar operation stands to gain tremendously from whatever it can learn from these methods.

EXPERTS

The simplest of these methods is the *jury of experts*. These should be persons who are thoroughly acquainted with the target country, its culture, and its people. They should preferably have lived in the target country for a long time and should have left it only very recently. Ideally they should be natives of the target country. Their absolute loyalty to the country that wants to use them as jury members must, however, be beyond question.

The procedure is for this jury to be asked to read or listen to the psywar material being directed at the target in question and predict what its effect will be within the target. Will it attract attention? Will it be understood? What reaction will it produce? Will it be accepted and believed? Will it change any minds or lead anyone to take the action desired? How could it be made more effective?

*Excerpts from *The Nature of Psychological Warfare*, Operations Research Office, The Johns Hopkins University, Chevy Chase, Md., September 1953.

The jury, of course, can be asked to *pretest* as well as to *posttest* the psywar output. That is, a leaflet designed for the target can be shown to the jury *before* it has been disseminated, and the criticisms and predictions of the experts can be used either in revising it or in deciding when and where to disseminate it. This is also possible, though less convenient, in the case of radio broadcasts.

The report of the jury will be valid only to the extent that the jury is truly expert, that is, to the extent to which it can put itself in the place of the target audience and anticipate the processes by which the audience will respond to the psywar material.

SAMPLE OF PERSONS

A second method of evaluation is the use of a *sample of persons as similar as possible to the target audience*. These can be refugees, defectors, POWs, or other natives available to the psywar planners. Continuous effort should be made to match the sample as closely as possible to the actual target audience. For example, if there is any reason to think that different groups within the target might react in different ways to the propaganda, then representatives of each of these groups should be included in the sample. Thus if three-fifths of the target population is illiterate, a sizable proportion (ideally, three-fifths) of the sample should be illiterate, so that their reactions will be reflected more prominently in the results than the reactions of literates. If there is a powerful trade union group in the target, with opinions and probable reactions of their own, then trade unionists should be represented in some such proportion in the sample.

Ideally, then, the sample should be a perfect miniature of the target audience. The picture as regards sex distribution, age distribution, geographical distribution, occupation distribution, economic status, educational levels, political viewpoints, and the like, should be the same as within the target. Practically, this is very hard if not impossible to achieve. It is considerably harder to put together a reliable miniature sample than to put together a panel of experts, for the miniature sample is only as good as it is really representative.

But if a representative sample can be obtained, then very useful results can be expected. The procedure is simply to expose the panel to the psywar material, and find out, from responses to before-and-after questions, what happens to the readers or listeners. Did they read or listen to all of it? What did they think of it? Did they understand it? Did they change any opinions as a result of it? What made them believe it, or kept them from believing it?

There are some real dangers involved in both methods, even when the experts using them are really expert and the sample is really representative. One of these dangers is that the members of the jury or the sample may give the opinions they think the questioner wants to hear. This is especially likely when the respondents are impoverished and insecure (for

example, refugees, defectors, and prisoners highly dependent on the income or preferment promised them for their cooperation and perhaps reluctant to criticize the questioners' propaganda unfavorably). It is still more likely when prisoners of war are used for the jury or the sample, since they may give deliberately false answers in the hope of making the propaganda ineffective. The evaluators must therefore investigate potential jury or sample members as carefully as possible before retaining them. Subsequently, these members must be tested from time to time with, for example, deliberately planted propaganda that is known to be poor or to differ in some important way from the material previously given, so as to find out whether their answers change with the changing material.

ENEMY SOURCES

The third kind of evaluation consists of a number of techniques, all of which in one way or other belong under the rubric of *intelligence*. The psywar unit should use every available avenue of intelligence in its attempt to find out about the effects of its propaganda on the target. Here are some of the ways in which intelligence sources can be used: [See Chapter VII of this casebook.]

Undercover Agents. These can be used as participant observers to report on the way psywar material is being received in their areas, and on the effects it produces. This is perhaps the most reliable single device; the agent can discuss the psywar with members of the target audience, listen in on conversations about it, and observe any actions that appear to result from it. All this calls, of course, both for an able agent and a good channel through which he can report.

Prisoners of War. These can be interviewed soon after capture. They can be asked what psywar material has come to their attention, what their own reactions are to it, what are the reactions of their fellow soldiers and superior officers, and what is the general state of opinion and morale in their military units.

Routine Intelligence. News, intercepted letters, captured documents, statistical reports, and information from defectors and other persons interviewed can and should be screened for information bearing upon the effectiveness of our psywar.

The Enemy's Actions. These often tell us something about the effects of our psywar messages. For example, variations in the number of surrenders are often revealing. So are the enemy's countermeasures. His counterpropaganda, monitored and analyzed, sometimes tells us which of our campaigns are proving especially bothersome. In the case of broadcasting, the programs he jams may tell us what we are accomplishing with what messages.

No psywar unit will rely on any one of these methods exclusively. Not to use all possible evaluative information out of available intelligence is inexcusable. Any operation will be able, without too much trouble, to set

up a small jury of expert observers; a representative sample is not beyond the resources of most field operations. But the information obtained from any one of these methods ought to be checked against what comes from the others; for example, what the jury says about a leaflet ought to be checked as often as possible with POWs who are being interviewed, and also with the information that comes out of the target country. When the judgments from the various methods tally, the presumption in favor of their validity is greatly increased.

EXPLOITATION OF CHANNELS OF COMMUNICATION

Use of different media forms to simplify the flow of messages and appeals from communicator to target is discussed in the papers in this section. The psyoperator's choice of media will depend on the size and distribution of the target and the cultural ways of the audience. In some cases the audiences for the same message will be diverse, yet circumstances may preclude tailoring the message to individual groups within the larger audience. The use of visual communications in the Nigerian civil war is an example of such a situation.

The third essay points out that media choice should also depend on the control authorities may have over the means of communication. This is a special consideration, particularly when developing propaganda campaigns for totalitarian societies. "News Broadcasting on Soviet Radio and Television" indicates the specific place radio and television broadcasting have in Soviet agitation and propaganda.

Leaflets, magazines, and wall posters are three widely used channels of communicating propaganda messages and appeals through printed matter. Technical matters such as the attention-getting features of magazine content, particularly when geared to intellectual groups, are of major importance. The wall poster, as illustrated in "Tatzepao: Medium of Conflict in China's Cultural Revolution," one form of mass media which does not depend on a high degree of literacy and availability of receivers, is one of the most dramatic means of communicating political ideas.

Accessibility of the target to the psyoperator's messages and appeals has been a serious problem in PSYOP campaigns. Some unusual techniques include the use of loudspeakers in broadcasting appeals from captured enemies, the use of postage stamps, and the use of cannon and balloons. The Vietnam experience in the development of aircraft as a PSYOP medium is reviewed in "Psychological Operations and Air Power: Its Hits and Misses."

Culturally designed techniques of communicating political ideas have been used extensively in Southeast Asia. Theater is not widely used as a propaganda device in the Western world, but in some cultures where the tradition is strong, drama teams, as political communications, may be one of the most important means of reaching a largely illiterate rural population if the messages are congenial to audience predispositions. Similarly, the North Vietnamese government uses songs to generate greater loyalty among its citizens.

The symbolic act may be referred to as a form of nonverbal communication. The authors of "Symbolic Acts as Psyop" see the importance of the symbolic in the meaning that it conveys to the target group and not in the physical impact that may result from it.

The use of individuals as channels for communicating messages and appeals is taken up in the last two essays of this section. "The Older Vietnamese as a Communicant" ascribes to aged individuals in Vietnamese society the role of disseminating ideas. In "An Unknown Warrior," the use of ralliers or returnees as a medium for reaching guerrillas and their families is discussed.

Many of these essays focus on a single incident or technique. In the final essay of this section, Morris Davis indicates the diverse communication interaction taking place simultaneously in the course of a civil conflict.

COMMUNICATION AND THE USE OF MASS MEDIA*

BY JOHN DENNIS LANIGAN

Making it easy for the target audience to receive a propaganda message or appeal will depend in large part on the communicator's choice of media.

No matter how primitive or oppressed a society is, there will normally be more communication presented to it than can possibly be received by everyone. We can only listen to one radio station at a time and can only read so much material in a day. . . . Hence, communicators (propagandists, of course included) should attempt to make it easy and beneficial for a target audience to "tune in." That is, they want to decrease the effort required to receive a message and increase the expectation of reward that will accrue from having received it. [Although] the problem of increasing the expectation of reward is primarily one of message content, . . . decreasing the effort required to receive a message is highly dependent on the media used to propagate it. . . . For this reason, we shall discuss the types of mass media in some detail.

THE MASS MEDIA

Numerous studies have been conducted to test the effects of the various forms of mass media on the understanding and retentive capabilities of a target audience. Such studies and experiments should be interpreted carefully. Laboratory tests may suggest that television is the most effective means of electronic communication. However, this result would prove to be virtually meaningless if the "real world" audience with which we wished to communicate had different characteristics than the "test" audience; or, in the extreme, if there was only one television set per

*Excerpts from "A Media Allocation Model for Psychological Operations," M.A. thesis, Naval Postgraduate School, Monterrey, California, June 1968. AD 841104. Reprinted with the permission of the author.

million people in the "real world" audience. The point to be made is that laboratory results do not necessarily reflect "real world" happenings. There is no hard and fast set of rules to govern choice of media. The attributes and drawbacks of the various forms of mass media will take on different values for different target audiences. For instance, depth of treatment is considered to be one of the attributes of print, but this "attribute" would be of minimal import if the target audience was illiterate. Hence, the general considerations of each form of mass media discussed below should be interpreted liberally.

FACE-TO-FACE DISCOURSE

Almost all studies on the subject of advertising or psychological operations are in agreement that face-to-face discourse is the most effective individual instrument of persuasion. The following psychological advantages are considered to be the primary reasons for its success:

1. It is more casually engaged in and will often attract an audience that would not trouble itself to receive the same information by other forms of mass communication.
2. The perpetrator of face-to-face discourse can mold his manner of presentation to suit a particular target audience. In this way, he can largely reduce resistance to his message.
3. By expressions of pleasure or displeasure, the target audience can be rewarded or punished for their reaction.
4. The source of face-to-face discourse may be a trusted or intimate friend of the target audience from whom information is believable; e.g., a clergyman.
5. It is sometimes possible to accomplish objectives without first instilling conviction. For instance, if the leader of a local young men's organization tells its members to sign up for service in the militia, some may join just to keep from discrediting themselves in the eyes of their leader.

We recognize that there are many cases when face-to-face discourse is not a practical method of communicating with a target audience. It would hardly be worthwhile for the United States to try to infiltrate men behind the "Iron Curtain" or into Communist China to start a program of face-to-face confrontations on the evils of communism and benefits of "free world" life. The costs would be great and the gains comparatively small. The Nationalist Chinese have on occasion attempted to infiltrate men into the mainland of China to instigate dissatisfaction in the populace. In every recorded case they have been captured almost immediately upon entering the country.²³ (We pre-suppose that the people of Communist China are more afraid of the consequences of not reporting an intruder than they are willing to chance a possibility of bettering their way of life; that is, the expectation of reward is negligible as compared to the effort required.)

Face-to-face discourse may also be considered to include the spectrum of discussions that take place daily throughout the world. Tests have

shown that casual conversations, as differentiated from formal addresses, are potentially more influential than any form of formal communication.²³ For this reason, the proponents of a propaganda campaign should be careful not to alienate any major fraction of the target audience, for the initial harm done could be greatly magnified through dissemination of discontent from that portion of the target audience alienated.

RADIO

In the recent past, radio proved to be an efficient means of mass communication to various target audiences. In the field of psychological operations, Radio Free Europe and The Voice of America have been broadcasting for years in an effort to "educate" peoples of the Communist world. The advantages of radio include: ²

1. The number of people that can be reached at one time is usually large.

2. The propagandist can gain a nation-wide audience by using networks or by increasing the power of this transmitter. He can also pinpoint a specific target audience by properly establishing a low-power transmitter.

3. Audience selectively can also be gained by scheduling at different times and by use of different types of radio programs.

4. It has a special persuasive quality as a companion, a friend, and a prime source of information for the listener.

When we consider the use of radio in communicating with a target audience we should not only be concerned with the present density of radios within the population. We should also project the costs and benefits that would accrue if we were to distribute radios to members of the population. In some cases it may be more cost-effective to give ten or twenty radios to every village within a country than it would be to attempt to communicate with the people by any other means. Of course, if we are considering giving away radios we must also consider that our intended audience may, in fact, use the radios to tune in on our enemies.

PRINT

The printed word, whether it be in the form of newspapers, magazines, leaflets, or any other form, has distinct advantages over the other types of media. The primary ones are: ²³

1. The reader is able to pace himself as he desires. He can ponder over important points and skip those that hold no interest for him.

2. Printed matter remains available for the reader to peruse for months or even years after the initial reading.

3. Difficult or complex topics can be treated in depth for the reasons given in (1) and (2) above.

4. It is possible to specialize appeals by utilizing the knowledge that certain people read particular types of magazines or sections of the newspaper.

5. Print may have greater prestige than the other forms of mass media. This is attributed to the fact that it is one of the oldest of the mass media and that print and "culture" have been traditionally associated.

A recent radio advertisement stated, "Montaigne once wrote, 'What do we do about those people who will not believe anything unless they see it in print?' " The advertisement went on to give the answer, "Print it, of course." As one might guess the advertisement was for a printing and lithographic company. However, it is probably true that some of these people who will not believe anything unless they see it in writing, will believe anything that is written.

When planning the use of print, we must take into account the literacy of the target audience. (The fact that a certain audience may be illiterate may not negate the use of print but it will certainly affect the amount of pictorial or symbolic material required.) We also need to consider the ease of dissemination. If we control the press it will certainly be much easier to reach the people than if we have to rely on covert publications or leaflet drops.

SCREEN

When we consider the use of screen, television or movies we are implicitly assuming that our audience is indigenous to a country in which we have some degree of control. The present state of the art in television is such that signals cannot be projected satisfactorily over great distances without a purposeful receiving station in the proximity of the target audience. Further, a television signal is considerably easier to "jam" and the prevalence of television sets in the areas of the world that are of major concern in our propaganda efforts is low. Likewise, there is little opportunity to show movies favorable to the "free world" in such countries as Cuba, Russia or Communist China. Hence, the benefits that we ascribe to the screen are greatly diluted by the opportunity for its use. The benefits are: ²

1. Concrete visual material is presented.
2. Recall of what has been seen is generally excellent.
3. Children are particularly impressed by what they see.

INTERACTIONS AMONG MASS MEDIA

Almost every propaganda campaign will include the use of more than one type of media to communicate with the target audience. If the target audience receives the same message by more than one medium, his belief in what he is receiving will normally be fortified. However, if different messages relating to the same incident or different interpretations on a particular propaganda theme are received via two different media, then, the target audience becomes confused, probably believes neither message, and loses some faith in both media. Credibility is hard to establish initially, but virtually impossible to re-establish once it is lost; hence, a cardinal rule for the use of mass media is to be consistent in all communication.

VISUAL COMMUNICATIONS IN THE NIGERIAN CIVIL WAR*

BY MORRIS DAVIS

Pictures may well be "worth a thousand words" in impact, but they are not necessarily an objective source of information.

Like Vietnam, the Nigerian-Biafran War involved not only men and material and words, but widely disseminated visual representations. It was a television war, a picture-magazine war, a newspaper-photographs war. Nigerian officials never really understood this sector of communications. When (to demonstrate their quick justice) they executed before the cameras the Nigerian officer who had a short time earlier (to show his serious intent) executed before the camera a captured Biafran, all they accomplished for most viewers was the piling of one revulsion upon another. The Biafrans, too, did not fully appreciate the graphic media. They rarely disseminated pictures, either directly or through the Bernhardt agency [see Chapter IV of this casebook]. Nor did they carry through with Robert Goldstein's plans for a full-length color film. But they really did not have to accomplish any of this for themselves. The sole necessity was that photographers and cameramen be let in; and that Biafra quickly learned to do.

In visual reporting, Nigeria could not win and Biafra could not lose. Pictures of nice Nigerian soldiers feeding and playing with smiling children in recaptured areas of the East looked phony and staged, no matter how frequent and genuine such conciliatory practices may have been. Pictures of malnourished, pain-wracked, half-dead Biafran children were instantaneously moving and plausible. Some of the imbalance in photo-coverage, to be sure, was due to Nigerian failures to cooperate with visiting crews. (The C.B.S. program "60 Minutes" struggled manfully in order to present a balanced report from both Biafra and Nigeria.) But even if Nigeria had been more adept and open-armed, its Biafran opposition would still have garnered most of the favorable visual reporting.

*Excerpts from "The Structuring of International Communications about the Nigeria-Biafra War," a paper prepared for delivery at the Eighth European Conference, Peace Research Society (International), London School of Economics, August 20, 1971. Reprinted with the permission of The Peace Research Society (International), copyright holder, and the courtesy of the author.

Television presentations were often compelling enough to stir other significant actors to important decisions. An ITN telecast viewed by an Oxfam staff member was apparently a major contributory factor in that organization's precipitous mounting of a large relief campaign. (Oxfam, incidentally, found to its surprise that Biafran officials in London could provide it with no pictures at all of starving children—the only photographs they had were of the 1966 massacres—and it had to rely on friends in the popular press for the picture which, in a cropped form, it featured in its publicity materials.) Similarly, a New York television appearance by Abie Nathan in late 1968 was seen by a member of . . . [a U.S. Senator's] staff and was responsible for a chain of conversations which awoke the Senator to the importance of the war and convinced him to visit the area early next year. Quite obviously, the mass media did not communicate just with the masses.

* * * * *

MEDIA OF COMMUNICATION AND PROPAGANDA*

By B. S. MURTY

The choice of means to communicate a message or appeal across national boundaries will often depend on the control the communicator has over these means.

The medium employed indicates the speed and reach of the communication and the expectations likely to be formed about its impact on the audience. The following are the most common media of communication employed by the strategists:

HUMAN BEINGS

. . . Travelers, traders, students, scholars, agents of political parties, people working in secret intelligence services, public information agencies of governments, all serve the function of channels of dissemination and /or intelligence. The extent to which each of these classes of persons functions, and their efficacy, indeed vary. [There are] advantages that strategists may derive by organizing or disintegrating groups, and by controlling intragroup communication processes.

. . . The elite which vigorously employs the ideological strategy generally takes to organization of strictly disciplined groups in its own state and in the opposing states. It also builds transnational political parties and tries to infiltrate men into other groups, either to disintegrate or gain control over them.¹

MAILS

In addition to written and printed materials transmitted through the mails, postal markings and stamps may be used to disseminate prop-

*Excerpts from *Propaganda and World Public Order*, Yale University Press, New Haven, Conn., 1968. Reprinted with the permission of Yale University Press, copyright holder.

aganda symbols.² As a means of transnational communication the potentiality of mails is limited, for the territorial authority may censor, refuse to transmit, or confiscate the mails if anything is found in or on them prejudicial to its interests.

Censorship of mail serves another purpose also, and that is to learn some secret information which the opponent is suppressing. Especially during war, censoring of mail may yield considerable useful information regarding the enemy.³

PRINTED MATERIALS

These constitute a very important medium of communication. When used as a means of transnational communication, the effectiveness of the medium can be minimized by the government of the territory to which the materials are despatched by adopting measures such as seizure at the customs posts.⁴ If the opposing elite tightens the frontier controls, printed materials may be transmitted by air-dropping, shooting leaflet-shells, and dropping by means of plastic balloons.⁵

TELECOMMUNICATIONS

Under this head may be included telegraph, telephone, and wireless communications transmitted either in Morse code, or by teleprinter, or in the form of multidirectional radio communications.⁶ Although these channels provide very rapid means of transmission of intelligence to processing centers and the processed materials to centers of dissemination, the extent to which strategists could use them in ideological strategy is limited by one factor: the government of the territory in which the transmission or reception points are located may exercise a high degree of control, weeding out anything likely to prejudice the government's interests.

RADIO BROADCASTING

This is by far the most effective means of mass communication available now to reach instantaneously audiences practically all over the world, and is believed to be the most efficacious means of transnational communication. The government that does not make use of this medium is exceptional. The Soviet Union initiated its use for transnational propaganda and all the leading states have, since the 1930s, copied its example.⁷

The government of the state to which transmission is made may, however, attempt to prevent its people from listening to the broadcasts by prohibiting listening to foreign broadcasts, jamming the radio waves, and denying to the people radio sets capable of receiving foreign broadcasts. Limiting reception to transmission by wire is another device. It was reported in 1951 that in the Soviet Union 18 percent of the receiving sets were capable of direct reception and the rest were useful only for reception by wire.⁸ In addition, the Soviet Union's jamming operations were at one time employed on a colossal scale.⁹ However, restrictive

measures such as these to prevent listening to foreign broadcasts may rouse the curiosity of the audience and induce them to adopt a good number of devious methods to circumvent the measures.

TELEVISION

Television may, for all practical purposes, be included in the category of radio broadcasting. It supplies additionally the advantage of combining visual image with aural communication.¹⁰ The advent of the communication satellites has tremendously increased the reach of television broadcasting.

MOVIES

Movies are a very effective medium of mass communication. But they can be used in an opposing state only within the limits permitted by its government.

It is not possible to say categorically that one medium of communication is more effective than another. Each has its merits and shortcomings. There is little doubt, however, that the most effective means of influencing the audience are communication by mass media followed by face-to-face contact by human agents.¹¹

- ¹ See generally, Sington and Weidenfeld.
- ² For instances, see *New York Times*, March 27, 1957; the Crusade for Freedom postmarks were placed on mails transmitted from the U.S.A. to Hungary and stopped by the Hungarian government. For controversy between the governments of India and Pakistan over similar use of postal markings by Pakistan, see *6 Foreign Affairs Record 86* (Ministry of External Affairs, Government of India, Extern Publicity Division, 1960). See also in this connection the editorial in the *New York Times*, April 19, 1962, on Communist propaganda through mails.
- ³ See Koop, p. 5 et seq.
- ⁴ In September 1963, Soviet officials searched 92 Chinese passengers, army officers proceeding to the U.S.S.R. for training, at the railway station at Zabaikalski; when they refused to surrender some newspapers and printed materials alleged to be anti-Soviet, they were not permitted to proceed further and were sent back. See *New York Times*, Sept. 14, 1963.
- ⁵ For a description of the operations of leaflet drops by plastic balloons, see *New York Times*, February 11, 1956; balloons were used as early as 1871 (Whitton and Larson, p. 24).
- ⁶ For a description of the various means by which telecommunications are currently used to transmit news, see F. Williams, *Transmitting World News, A Study of Telecommunications and the Press* (Paris: UNESCO, 1953).
- ⁷ The Voice of America, in 1956, broadcast in 43 languages to Europe, Latin America, the Near East, South Asia, Africa, and the Far East; see Martin, p. 28. The B.B.C., by 1946, was broadcasting on 31 transmitters, in 46 languages, for 616 hours weekly; *ibid.* p. 38. In regard to the U.S.S.R., see *ibid.* p. 47; Whitton and Larson, p. 50; regarding Communist China, see Houn, pp. 156-58.
- ⁸ Inkeles, p. 238; also see H. N. Graves, Jr., *War on the Short-Wave*, Foreign Policy Headline Series No. 30 (New York: Foreign Policy Association, 1941), p. 52. The author says that the Nazis introduced a receiving set called the "People's Set" which was incapable of receiving foreign transmissions. In 1938, only about one third of the sets in Germany were capable of receiving foreign transmissions. After the war broke out, listening to

foreign broadcasts was banned. See also Sington and Weidenfeld, p. 145. In Japan, from 1933, possession of short-wave sets was banned and penalties were provided for listening to foreign broadcasts. In occupied territories, as for example in Burma, the receiving sets of the people were remodeled. See Peter de Mendelssohn, *Japan's Political Warfare* (London, Allen and Unwin, 1944), p. 33; Communist China uses extensively wire-transmission (Houn, pp. 162-66).

⁹ For details of the transmitters used for jamming when the cold war was intensifying, see 21 *Dept. of State Bull.* 312 (1949); also, the speech of the U.S. representative before the U.N. General Assembly (G.A.O.R., Fifth Sess., 3rd Committee, 1950, p. 279). However, in recent years there has been a progressive decrease in jamming operations. President Kennedy reported at a press conference on October 10, 1963, that for many months the Voice of America broadcasts had not been jammed by the Soviet Union. See *The Hindu*, Oct. 11, 1963.

¹⁰ It is said that at present, apart from the United States, 82 nations have television broadcasting. There are about 56 million receiving sets and 996 broadcasting stations outside the United States. In the United States there are over 500 TV broadcasting stations. See Gordon, Falk, and Hodapp, pp. 137-38.

¹¹ For detailed information see J. T. Klapper, "The Comparative Effects of the Various Media," W. Schramm, ed., *The Process and Effects of Mass Communication*, pp. 104-05, and the editorial note, p. 91 et seq. Four factors, it is said, are relevant in this context: (1) *time-space* (i. e. whether the communicator has control over the material to be communicated and when to introduce it); (2) *participation* (by the audience in the communication process); (3) *speed*; and (4) *permanence*. Printed material has the advantage of fairly good time-space control and of permanence, but is not useful if the audience cannot read, and is slower than radio broadcasting. In favor of radio broadcasting are factors 2 and 3, but not 1 and 4. Human agents have in their favor factors 1 and 2.

NONGOVERNMENTAL COMMUNICATIONS IN THE NIGERIAN CIVIL WAR*

BY MORRIS DAVIS

A discussion of the multiplicity of communication channels in an internationalized "domestic" crisis.

To describe accurately and clearly so complex a quasi-system as that of the [unofficial] international communications about the Nigerian-Biafran War involves difficulties not unlike Joyce's attempt to convey the boredom of church sermons in his *Portrait of an Artist* without at the same time boring the reader. Phenomena and their descriptions are, to be sure, separate in theory, but their separation is in practice still quite difficult to achieve. In the comments below we shall try to describe facts usefully and yet not impose more of a "system" on activities than they reasonably bear.

* * * * *

*Excerpts from "The Structuring of International Communications about the Nigeria-Biafra War," a paper prepared for delivery at the Eighth European Conference, Peace Research Society (International), London School of Economics, August 20, 1971, pp. 1-12. Reprinted with the permission of The Peace Research Society (International), copyright holder and the courtesy of the author.

STUDENTS ABROAD

Many Nigerians and Biafrans—particularly students—lived away from their homeland during the war. Often they kept in touch with their government's local officials and would receive various propaganda material. For at least two interconnected reasons, however, they were rarely crucial communicators in their country of domicile. On the one hand, the withdrawal of Ibo leaders left most overseas Nigerian organizations without sophisticated and experienced direction. On the other hand, students loyal to Biafra were politically inhibited by the fact that continued residence under a Nigerian passport was somewhat a matter of sufferance.

The extent of the inactivity should not be exaggerated. Nigerian students from the Rivers State, for example, managed to form a cause group in Britain that attracted considerable notice; and they received material encouragement from the High Commissioner and his public relations advisers. Some members of the Biafra Union were similarly willing to be demonstration fodder at Trafalgar Square rallies, at Whitehall burnings in effigy, and at Shell petition marches. In general, though, the fairly dense network of Nigerian and Biafran organizations abroad strove after mutual support and good fellowship. Their members were better at running dances in St. Pancras than lobbying or pamphleteering. They were bound to be ineffective communicators anyway, since—as foreigners—their interventions in domestic politics would tend to be either resented or ignored. They were really nobody's constituents; and their communications influence has surely been much overstated.

FOREIGN PRESSURE GROUPS

Indigenous pressure groups were politically better situated to communicate in their own countries about the Nigerian-Biafran War. This fact, reinforced perhaps by Ibo clannishness, helps explain why the "Biafra lobby" in Britain (to use that country as an example) was so lily-white. Of those groups which arose solely because of the Gowon-Ojukwu* struggle, only the Friends of Biafra, a relatively minor organization, had a sizeable African component. The others—the Britain-Biafra Association, Save Biafra Committee, Biafra '69, an unnamed association of ex-colonial officials, and even the rather tardily arranged and short-lived Coordinating Committee for Action on Nigeria/Biafra—were almost entirely Caucasian. An occasional foreigner, from Israel perhaps or from the United States or Germany, participated prominently, just as a person from Britain might play an important role in a counterpart American group; but the overwhelming impression is that the Biafra lobby exemplified typical British cause group development.

*Nigerian Prime Minister, Lt. Gen. Yakubu Gowon and Biafran Chief of State C. Odumegwu Ojukwu.

With rare exceptions, all persons who mattered in the Biafra lobby had had a previous material connection with Nigeria, often an extended period of residence or travel in the former Eastern Region. Their experience made it easier for them to champion Biafra authoritatively; but it also made them less susceptible to outside control or direction. They were certainly not tools of the Biafran government or its London office. Biafra did not arrange for the pressure groups to be established nor did it intervene in their policies or funding. Indeed, the groups were usually shoe-string affairs; and what little monetary flow there was moved in the other direction, small sums occasionally being raised for Biafran humanitarian or political purposes. Individual lobby members did not lack informative ties to the Biafran government—they were in frequent contact with Biafra House, sometimes met visiting Biafran officials, and on rare occasions even made brief sorties into the enclave—but it was generally they and not Biafran officialdom who initiated and shaped the interactions.

The multiplicity of Biafra lobby organizations in Britain reflects disorganized competitiveness as well as yeasty enthusiasm. Their variability, however, also permitted a useful division of labor. The ex-colonial officials, for example, utilized long-standing relationships with persons in the Foreign and Commonwealth Office, prepared lengthy and reasoned position papers, and circulated petitioning letters to Members of Parliament. The Britain-Biafra Association published intelligently partisan booklets and circularized a handy and usually reliable weekly newsletter specifically aimed at a British readership. (Initially, the BBA based its news of events inside Biafra on Bernhardt releases mailed from Geneva; but later it discovered that it could obtain almost identical material days earlier from telex messages posted in Biafra House.) The Association also attempted some low-keyed contacts in Parliament. Other Biafra lobby groups adopted more overt or impassioned communications. Biafra '69, for example, tapped a moneyed stratum through champagne dances and Albert Hall musicals, while the Save Biafra Committee . . . engaged in rallies, marches, sit-ins, and similar forms of pseudo-violence.

As with many other cause groups, the leaders of the Biafra lobby frequently lacked normal family lives. With depressing regularity they were divorced, separated, unmarried. Still, this did mean that they could put their whole heart into their organization's communicative work and into monitoring the activities of friend and foe. Not until the last half-year of the war, to be sure, did most of the lobby groups (and others) join any formal Coordinating Committee. And not until a year after that did three still extant groups—the Britain-Biafra Association, Friends of Biafra, and Save Biafra Committee—meld their efforts in a single project, a rather wan exhibition about the war and its origins. The leading lights in the various organizations had been keeping in touch all along, however, through telephone messages from house to house, casual or arranged meetings, conversational linkages provided by concerned ex-

perts like news analyst Suzanne Cronje and economic consultant George Knapp, and in due course reading about one another's activities in the pages of the militantly pacifist journal, *Peace News*.

Similar judgments—about white dominance, independence of Biafran governmental control, complexity of structure, functional division of labor, and only partial and often informal coordination—apply to the emergent American, Canadian, and Dutch pro-Biafran group ensembles of which I have knowledge; and I would imagine that analogous comments apply elsewhere in Europe. Pressure groups that arose to favor the Federal Nigerian casue, by contrast, were scarce indeed. The only such organization I know of in Britain is the United Nigeria Group; and it began in fact as a front inspired by Nigeria's public relations consultant. Its small membership included establishment types with business, military, and government backgrounds, who were easily discouraged when their turgid pronouncements were not eagerly accepted by a grateful press; who usually had wives and children and a normal life to engross them; and whose performance, however sincere their views, was characterized by a zealous concern for personal thrift and by yawning lassitude. In all this they resembled, for good or ill, the Federal regime they ostensibly supported.

FOREIGN LEGISLATORS

Legislators, especially but not exclusively those who favored Biafra, often saw in the war a vehicle they could ride to prominence in hearings and debates, and hence in the media and in the minds of their constituents. . . . And even when constituency pressures were absent, . . . it was the legislator who chose his own approach in the light of his own preconceived doctrines. Members of Parliament . . . who visited Nigeria and/or Biafra, played a featured part in the many debates and questions on the Biafran struggle that roiled the Commons after the first year of the war had passed. They were also able to get letters and articles about their trips into the press and their views fleetingly memorialized on radio and television. American Congressmen . . . who journeyed to Africa . . . received similar though muted coverage, the United States all during this time being primarily concerned with . . . Vietnam.

Except for personal visits, most ordinary legislators, in Britain and elsewhere, were limited to much the same sources of information as lay publics. They could listen to the pronouncements of Gowon or Ojukwu and their entourages, though these would be subjected to a heavy, almost total, discount. They received professionally edited materials from the public relations firms retained by the governments—a little for Nigeria, a mountainous heap for Biafra—but these too, with the exception of some Galitzine-produced materials that a few M.P.'s found signally worthwhile, they almost automatically consigned to their "circular files." (Many pro-Biafran M.P.'s considered the snowdrift of releases blowing in from Geneva a dysfunctional embarrassment.) They could rely

on the position statements offered by their own government, or by their party leaders, or by their party research offices, all of which supported a generally pro-FMG [Federal Military Government] position. They could rely on one another, either through open debates recorded in Hansard, or private conversations singly and in unofficial parliamentary and semi-parliamentary committees. (The three committees most relevant to this narrative were all on the Federal Nigerian side. Biafran sympathizers in Parliament made do with informal tête-à-têtes. This off-the-record communicating was not accessible to large publics.) Legislators who favored Biafra could also obtain information processed by indigenous pressure groups, receiving it either directly or through intermediaries whose sound judgment they particularly trusted. Finally and perhaps most crucially, newsmakers though they were, it was to the news media, and particularly the quality press, that M.P.'s turned both for reporting (which in its most arresting versions . . . often had a strongly pro-Biafran slant) and for editorial opinion (usually subtly pro-Nigerian, but sometimes . . . blatantly so).

FOREIGN GOVERNMENT OFFICIALS

Elected and appointed governmental executives supplemented public sources of information with more discreet materials. Diplomatic cables and reports moved continually between the Nigerian land-mass and the home capital. International comity being what it is, most Western countries sustained better contacts with the authorized Lagos government than with its Biafran rival. And even in that Federal domain, views and facts were usually obtained only from a narrow, establishment-favoring stratum. Conflicting accounts from Nigeria, and almost everything issuing from Biafra, were typically suppressed or ignored. Nonetheless, executives in the United States, Holland, Britain, and elsewhere could speak with genuine assuredness, since they did have access to otherwise unavailable information—or at any rate to otherwise unavailable devices for carrying that information. . . .

The authoritative tone which the executive branch adopted on Nigeria-Biafra, as on foreign policy questions generally, was enhanced by a feeling common in Western capitals that the Nigerian government was incapable of presenting its side of events. Biafra, in the view of many foreign ministries and of the State Department, was good at self-justification, and Nigeria simply was not. What Nigeria could not do alone, therefore, the friendly Western governments tried to do for it. Their bureaucracies issued statements, speeches, bulletins, and even booklets defending the Nigerian cause—which was, after all, their cause, too. They affected diplomatic reporting and editorial policies by constant thematic reiterations at open news conferences and closed background sessions. They subjected newsmen returned from Biafra to hostile debriefing sessions, while they deftly manipulated their much prized relationships with other correspondents in order to moderate criticism and induce more

favorable evaluations. In all this the British government apparently took the lead, while the behavior of the United States and other Western countries was similar but fainter. At the least, America's "policy of not intervening in the internal affairs of African nations while at the same time, distinguishing between non-interference politically and the humanitarian obligation to help lessen human suffering," to quote a former State Department official, meant that it would do nothing to staunch the British flow of material and verbal support for Lagos, that indeed its own gentler trend of language and action would move along nearly the same lines.

MULTINATIONAL CORPORATIONS

Foreign businesses like Shell and United Africa Company lay low during the war. Their business, so they think, is business, not politics; and a native war was not seen as a boon to them. Fundamentally, they wanted to be on a profitable footing no matter how the war ended. Except for certain grudges against the Ibos, they did not care much who won the struggle or what the ultimate political map of Nigeria resembled. Their greatest desire was to retain their customers, markets, and skilled workers throughout the entire area. As a result, expatriate firms (until close to the end of the war) generally avoided public statements about the struggle. In private they were more ready communicators. They were willing to meet with Biafran officials and their lawyers during the early days of that regime and discuss oil royalties and rents. They were willing a year later to endure a harsh tongue-lashing by Nigeria's Chief Enahoro in the City of London. Not unlike canny operators making political contributions in American two-party cities, they understood the advantages in extending financial support to students from both Biafra and Nigeria who were taking courses abroad. Such communication was careful and quiet. Its obvious aim was to reduce the intensity of public discussion about the war.

INTERNATIONAL HUMANITARIAN ORGANIZATIONS

Relief and eleemosynary organizations played their role far more openly. Some with particularly close links to government did prefer impermeable modes of communication—thus, the Presbyterian Church in Canada and the Save the Children Federation in Britain—but most turned skillfully to the mass media. Religious groups often used these public channels more effectively than their secular counterparts; but the excellent, though shortlived, propaganda efforts of Oxfam indicate that religiosity was scarcely a necessary condition for such an ability. A better explanation for much of the difference is that responsibility for relief efforts behind the Federal lines, where needs were less sensational and where only natural and bureaucratic obstacles, not anti-aircraft fire, impeded logistics, fell to a largely secular consortium headed by the International Committee of the Red Cross (ICRC). Relief efforts in

Biafra, where the story was far more colorful, were by contrast most notably undertaken by an ecumenically Protestant-Catholic organization, Joint Church Aid (JCA).

Organizational proclivities and human resources within the ICRC and JCA themselves, however, also help explain their differing communicative behavior. The ICRC was centralized, ponderous, and bureaucratic. It was enmeshed in a time-honored legalistic ("juridique") tradition. Its past achievements and future intentions made it leery of being considered partisanly political; but that is precisely what its preoccupation with international legal norms constrained it to become. (The result was that ICRC efforts were an adjunct of Nigerian, but not Biafran, activities. The howl that emanated from ICRC headquarters, when the organization was charged by the *Nigerian* government with political interference and bias is, therefore, sadly understandable.) As for JCA, many of its constituent groups worked in Federal Nigeria as well as Biafra; but the consortium itself, unlike the Red Cross, never entertained any vain hope of operating simultaneously effectively in both jurisdictions. It had no need, therefore, continually to strike poses of objectivity; and it readily became identified as a Biafran champion.

To obtain funds the ICRC activated many time-worn connections to Western governments; but it also avoided behavior that might jeopardize that network for the future. JCA—as a temporary, one-cause group—was less inhibited. Through secondment it enjoyed the talents of component organizations in Holland, Germany, Denmark, Switzerland, and Italy, as well as those of distribution teams in Biafra and of many religious groups throughout the world. Leaders in JCA . . . quickly learned how to make descriptively harrowing and numerically impressive statements to the press. It was to such religious figures, too, rather than to Biafra's special representatives or its public relations firms, that newsmen increasingly turned for information or for help in obtaining entry into the Biafran enclave. Even more impressive in their totality were discussions and articles and fund drives at the parish and local church levels. For while JCA, like the ICRC, depended primarily on governments to fund its relief activities, it always sought a wide constituency of private contributors as well.

Despite JCA's genuinely ecumenical structure, many persons viewed Biafran relief as primarily Catholic in inspiration. The prominence of Catholicism in Biafra helps explain this, as does the anti-Catholicism expressed by some of its opponents. . . . The exceptional communicative skills of many Catholic spokesmen also pressed in the same direction. One can cite in evidence many Holy Ghost Fathers, in Biafra and Fernando Po and in the sorties outside; the film "Flight to Uli," which focused on that Order's activities; JCA press releases issued in Geneva by the Overseas Office of Catholic Relief Services, [and the like]. . . . Such a superabundance of talent became almost too good for its own advantage.

OTHER INTERNATIONAL ORGANIZATIONS

Other international bodies besides the relief agencies also commented publicly and effectively on the Nigerian-Biafran war. The three to be discussed here—and the three most important . . .—all furnished crucial support to Nigeria's regime.

The United Nations, in the person of U Thant, came down squarely in favor of Nigerian territorial integrity. The failure of the issue to be debated in any United Nations forum worked more subtly to the same end, for it deprived Biafra's supporters of a floodlit opportunity to present their views. The frequently reiterated stand of the Organization of African Unity, favoring the Federal regime and requesting a virtually unnegotiated Biafran surrender, helped justify U Thant's position as well as that of most Western governments.

It was Nigeria's canny decision in late 1968 to invite an international team of military observers into the country, though, that was most instrumental in re-establishing the moral probity of the Lagos government. One can justifiably object to the ease with which the Team was satisfied on evidence as well as the narrow syllogism with which it apparently reasoned (a. Wartime conditions are usually hell; b. Things are hell in Nigeria; c. Everything is as it should be); but clearly the Team's several Reports did help undercut Biafra's genocide claims. Indeed, *this* genocide charge, unlike an earlier one stemming from the 1966 massacres, was so easily deflated that one must view its propagation as a serious communications blunder.

In any event, the excellent (from a Nigerian standpoint) and consistent findings of the International Observer Team, findings that were reprinted by the Nigerian government in batches of 50,000 and widely quoted by leaders of friendly countries and the world's press, and the care with which the U.K., Poland, Canada, and Sweden were selected as Team members, have led some analysts to see in this the Machiavellian hand of Britain's Foreign and Commonwealth Office. It was too brilliant a stroke, they think, for Nigeria to have hit upon itself. Such a conclusion is hardly fair. The Federal Military Government was, throughout the war, better at high-level than widely publicized communications. And besides, even if they were acting on Britain's suggestion, they did at least exhibit a rare capacity for accepting good advice when offered it.

THE INTERNATIONAL PRESS

From the beginning, Biafra was more concerned than Nigeria about the foreign press. Even before secession the Ojukwu regime had issued many booklets and communiques, while the Lagos government sniffed about washing dirty linen in public and retreated into virtual silence. That kind of difference persisted all during the war too. Nigeria rarely welcomed journalists. It was often achingly slow about issuing entry permits; and when it did welcome an occasional reporter or news team, it usually was discouraged by the results and became even less cooperative

in the future. The protracted post-war exclusion of journalists from the former combat areas, and especially from the East-Central State, after a brief period in which barriers to reporting had been removed, strikingly illustrates this persistent Nigerian tendency.

Biafra, by contrast, continually courted outside newsmen. During the first year of the war it leaned heavily on its public relations firms. Robert Goldstein, for example, helped organize a press conference for Ojukwu in Biafra, reporters from Canada, the United States, France, and Britain being in attendance. With great care the Bernhardt staff subsequently arranged for a select group of British journalists to tour the country during the week of April 21, and to dispatch a dramatic drumroll of stories to their papers. As the war continued, however, Biafra got the hang of inviting and squiring reporters by itself, while they in turn resorted to Biafra's special representatives or to church officials with Biafran ties in order to obtain an entry permit.

Throughout the war Biafra was good copy. It was a plucky and determined nation fighting against great odds. Its leadership was articulate and dynamic. An aroma of oil pervaded the whole contest, while the struggle not only saw brave soldiers fighting and dying but civilian installations undergoing wanton and terrorist bombings. In the midst of all this there arose the specter of mass starvation and the cowboy exploits of the international relief operation. The alarming and horrific facts could be handled in a brashly sensational manner by the popular press and in a quietly sensational manner by its quality counterpart. The Biafran government made the filing of stories easier by giving reporters access to its telecommunications link with Geneva on a daily basis, without censorship, and at standard rates. Biafra's success with newsmen sometimes induced Nigeria to follow suit, as when it had its public relations firm arrange for British journalists to tour its domain a month after Bernhardt's master stroke. But because Nigeria's efforts were half-hearted and its story less interesting to relate, the results usually discouraged it from sustaining a receptive attitude.

Nigerians could take solace from the sympathy accorded them by crucial portions of the press, even though most reporting proceeded otherwise. Thus, it received constant editorial support from the *New York Times*, despite the often hostile war coverage in its news sections. It obtained favorably balanced coverage in the establishment weekly *West Africa*, and insightful analysis by the *Financial Times* correspondent. . . . An occasional defection in the ranks of Catholic journalism . . . also gave Lagos reason to rejoice.

While the bulk of press commentary unquestionably favored the Biafran side, the breadth and dependability of the commitment should not be exaggerated. Biafra was lauded as a brave country, valiantly fighting against insuperable odds and struggling to retain semblances of normalcy even under wartime chaos. Its dead and dying, and especially its displaced and starving civilians, evoked great cries of sympathy. Such facts

moved humanitarian organizations to prodigious labors and caused common folk to dig deep into their pockets. Yet, these same facts neither convinced governments to come to Biafra's *political* aid nor induced their mass citizenry to insist upon that choice. Valor and decimation, after all, cut both ways. If they furnished reasons for Nigeria to relent, they also furnished reasons for Biafra to surrender. As Ibo leaders like Asika and Azikiwe, who came over to the Federal cause kept remarking: "Enough is enough." To many Ojukwu's determination to continue resistance eventually suggested a callous disregard of his people's survival; and when, for alleged military and security reasons, he rejected the daylight relief flights into Uli that the FMG announced it would permit, nearly all his friends in the press began deserting him. Biafra's genocide-starvation theme thus revealed itself as doubly unwise. It comported poorly with elite-centered *Realpolitik*, for it was an argument from dire weakness. It was also a dubious choice for broad-scale communication, since its logic required that the Biafran regime appear morally superior to its opponent. Once that was no longer so evident, the theme in fact became a serious obstacle to sustained public support for Biafra's separate existence.

NEWS BROADCASTING ON SOVIET RADIO AND TELEVISION*

By F. GAYLE DURHAM

Domestic news broadcasting in the Soviet Union serves to generate political support for governmental policies and programs and further the development of a Communist society.

We may gain a direct insight into the Soviet conception of the functions of radio and television from the following explicit statements made in a resolution by the Party Central Committee:

The main task of Soviet radio broadcasting and television is the *mobilization*** of our country's working people for the successful implementation of the Seven-Year Plan and the entire program of the comprehensive construction of Communism in the USSR for raising labor productivity and stepping up progress in all branches of the national economy . . . Radio and television must *inculcate* in all Soviet people a Communist attitude toward labor and the need for participation of every Soviet person in socially useful work. Radio and television must *demonstrate* the people's condemnation of loafers and good-for-nothings who try to live at the expense of others and must describe in concrete terms how labor becomes a need of Soviet people.

*Excerpts from "News Broadcasting on Soviet Radio and Television," Research Program on Problems of Communication and International Security, Center for International Studies, Massachusetts Institute of Technology, Cambridge, Massachusetts. June 1965. The research for this paper was sponsored by the Advanced Research Projects Agency (ARPA) of the Department of Defense. Reprinted with the permission of the author, copyright holder.

**Italics are author's.

Radio broadcast must *help people to think through* the historical changes in the life of mankind that have occurred mainly through the heroic deeds of the Soviet people who are building the most advanced and just society. It must tell of the advantages of socialism over capitalism, *unmask* the falsity of imperialist propaganda, and *train* Soviet people to be irreconcilable toward bourgeois ideology. It must *educate* them in a spirit of pride in their motherland, and in their work, and in a spirit of patriotism and internationalism.¹

The very verbs used to indicate the functions of these two media show the breadth of influence which they are expected to play in the lives of their listeners. Far from being instruments of passive entertainment or of education in an informative sense, radio and television in the U.S.S.R. are pledged to act as active instruments of socialization for Soviet citizens in order to speed up the formation of the "future Communist society." They are viewed as instruments of indoctrination in Communist values and ideology as interpreted by the Party leadership at any given time, and as translated into economic, social, or political policy; further, they are agents of agitation for implementation of those policies. Not surprisingly, newscasts as a component part of "political broadcasting" play a leading role in this propaganda and agitation.

The specific place of radio and television in the network of mass media which report news has fluctuated considerably from time to time, depending upon the rigidity of censorship at any given period. Thus, for example, complaints were rampant during the early and middle fifties that news broadcast on radio and television was simply a rehash of those items which had appeared earlier in the pages of *Pravda* and *Izvestia*. The reasons for this are related to the sources of information and mechanisms of clearing of content of broadcasts. At certain times the main source for approach and commentary, and often for the actual news item itself, was the official Party organ, *Pravda*. Whatever items *Pravda* selected for emphasis, and whatever view *Pravda* took for presentation and interpretation served as the governing approach for radio and later, television newscasts as well. Thus, radio could not perform the functional role in news reporting which it has traditionally occupied in the Western mass media system—that of being able to present the news almost as soon as it happened, "ahead of the headlines." Complaints of the tardiness of broadcast news became widespread, not only among members of the populace at large, but increasingly among members of the radio and journalistic professions. Gradually the complaints crystallized, and the result was the official, published resolutions of 1960 stating the following change in policy:

The central radio stations in Moscow must first of all assure timely broadcasts of important political information, effective commentary on domestic and foreign events, and the organization of various artistic programs . . . Because radio should give the population the important news before the newspapers do, TASS has been instructed to transmit news immediately to central and local radio stations.²

The handbook prepared by the State Committee on Radio and Television, published in 1963, specifically states: "Radio should communicate to the population all important news earlier than do the newspapers." ³ Recent audience research has indicated that news broadcasts now rank among

the most listened-to programs. Because of their frequency and because news begins and ends the broadcasting day, for most citizens the news provides a framework for the entire broadcasting day.

Besides providing the population at large with information on and interpretation of events, news broadcasts also serve the very influential function of acting as an important source of interpretation for the widespread network of Party agitators and other specific segments of the population. These agitators learn a great deal about selection of items for emphasis and Party policy from the approach which a radio newscast or commentary takes toward any specific event. Thus the news items broadcast are expanded, amplified, and elucidated by the personal efforts of agitators.

STRATEGIC LEAFLETS*

BY CARL BERGER

Strategic leaflets have been employed for varied purposes such as news, directives, and political arguments and for appeals to target groups to prepare them for certain military activities.

In both World War II and the Korean conflict, the strategic leaflet came into play soon after the outbreak of fighting. Ninety-six hours after Hitler's armies marched into Poland in September 1939 and set off World War II, Britain's Royal Air Force dropped six million leaflets on Germany.¹ Their purpose was strategic—to explain to the indoctrinated German people the British version of the causes of the war and to warn of the consequences of continued support of the Nazi regime. The bulk of all Allied leaflets used in Europe continued in fact to be strategic until after the successful D-Day landings had changed the military situation to a more fluid state, in which tactical leaflets would be appropriate and useful. Similarly, in late June 1950, within 72 hours after the Communists launched their Aggression against the Republic of Korea, the U.S. Far East Air Force began disseminating 100,000,000 leaflets over the peninsula, telling of the "cease fire" orders of the United Nations, revealing to the North Koreans "the duplicity of their leaders," and bringing "encouragement to the people of the Republic of Korea."²

*Excerpts from *An Introduction to Wartime Leaflets*, Documentary Study No. 1, the American University, Special Operations Research Office, Washington, D.C., 1959 AD 220 821, pp. 7-19.

In both cases the start of hostilities provided an opportunity, not usually found in peacetime, to break the totalitarian monopoly of news and information; that is, to speak directly to enemy peoples through the printed word. (Radio, of course, is available in both peace and war but, enemy jamming efforts aside, one can rarely be certain who is listening.) These early strategic leaflets, besides trying to restore a balance to the distorted version of events given the people, also sought to undermine confidence in the existing regimes. As the fighting continued, leaflets were used for a variety of military and humanitarian purposes, for example, to give bomb warnings to specific communities, to disrupt enemy factory production, or to cause internal dissension.

Most strategic leaflets of recent international wars were prepared, written, and printed in rear areas, where the necessary large production facilities existed. Paris and London were the centers for the large-scale production of Allied leaflets in World War I, while in the second World War the bulk of the leaflets dropped over Europe was produced in London. In the war against Japan large printing facilities in Australia, Hawaii, and the United States also produced millions of leaflets for strategic purposes. Japan was the center of U.N. leaflet production during the Korean War.

The purpose of disseminating strategic leaflets to occupied and presumably friendly countries has often been simply to give news of the outside world in an effort to keep up morale and encourage the people not to give in to the enemy. In World War II, prior to the Allied landings in Europe, about half of the Allied strategic leaflets went to Germany, about 43 percent to occupied France, and 7 percent to the Low Countries. But once the Allies were back on the European mainland, 90 percent of the strategic leaflets were directed against German targets and the remainder against the French, Belgians, and Dutch.³

During Britain's struggle against Communist terrorists in the Malayan jungles, the bulk of leaflets dropped was strategic and long-term in the following sense: their primary aim was "to condition the minds of the Communist terrorists in such a way that when affected by physical factors, such as food shortages, pressure by Security Forces, or internal dissension, they would defect and take advantage of the Government's invitation to surrender."⁴

* * * * *

During the Middle East crisis of July-August 1958, the strategic leaflet was brought into play by the United States government. A million copies of an Arabic-language special leaflet, signed by President Eisenhower and illustrated with his photograph, were disseminated by aircraft over Lebanon. The English text was as follows:

TO THE CITIZENS OF LEBANON:

The forces of the United States have entered your country at the request of your own established government. These forces are here to assist you in your efforts to maintain the independence of Lebanon against those who desire to interfere with your affairs and who have endangered the peace and security of your homeland.

The American officers and men have left their homes to assist in the protection of your way of life, your prosperity and your families. They will leave your country as soon as the United Nations has taken measures assuring the independence of Lebanon.

The American government has acted in response to an appeal for help from a peaceful nation which has long had ties of closest friendship with the United States.⁵

This leaflet is an excellent example of the uses to which the strategic leaflet can be put. Leaflets of this nature have been described as "long-range in scope and . . . designed to orient the opinions, attitudes, emotions and ultimately the behavior of the target audience towards the broad objectives of United States policy."⁶ Used in wartime against an enemy target, strategic leaflets are aimed at increasing tensions and thus decreasing the enemy's emotional and productive capacity to wage war.

It is not surprising that the same strategic leaflet themes have recurred in various conflicts. For example, Allied propagandists in the first World War published the following leaflet in late 1917, reminding their German readers of the suffering they had undergone:

YOU POOR GERMAN PEOPLE!

Already you are in the 4th year of this war. One shudders to think of your suffering, which will increase this year. To the hunger, the pestilence, the cold, will be added the terrible campaigns on the front and the aeroplane attacks on your cities. . . .

Three million dead, the flower of your nation, the future of your land, rest in foreign fields; one million of your best sons languish in prisons; millions of your children will have become poor, helpless orphans. . . .⁷

In the Korean action, American propagandists returned to a similar theme in strategic leaflets dropped on North Korean targets. In October 1952, their pungently worded leaflet, headed "A Third Winter of the Communists' War," bluntly charged: "Your bosses condemn you to a third winter of war—of death and misery! The Communists ignore your suffering. On orders from their Chinese and Russian masters, they refuse to accept a just and honorable peace. They prolong the war that lays waste to your land. They prolong your suffering. They bring death to your people . . ." ⁸

Although the tone of these leaflets differ greatly, both were aimed at creating tensions within the enemy camp and lowering morale.

Another strategic leaflet dropped on the Japanese mainland in the summer of 1945 had as its purpose clarification of the Allied policy of "unconditional surrender." This leaflet, in the form of a special statement to the Japanese by President Truman, explained the phrase as follows:

What does military unconditional surrender mean to the Japanese people? It means the end of the fighting and the termination of the power of the militarists who have led Japan to the brink of destruction.

Again, it is the first step in returning soldiers and sailors to their families, their farming villages, and to the places where each has his job.

Furthermore, it means not prolonging the agony and suffering of the Japanese people, who are clinging to the dream of victory. It does not mean the extermination or enslavement of the Japanese people.⁹

The themes examined above are but a few of those which have been used in strategic leaflets in the past. It is clear that the theme of the strategic leaflet, under normal circumstances, reflects the nation's political and military situation.

THE NLF LEAFLET*

BY DOUGLAS PIKE

The frequency in the use of the propaganda leaflet by a revolutionary movement may be related to the development of the movement's organizational structure. The more highly developed the organizational structure, the more selective, less random, and less important does leaflet distribution become.

The traditional communicational tool of the revolutionary, the clandestine leaflet, was the major mass medium of the [National Liberation Front] (NLF) in its earliest days. Leaflets collected by the [Government of Vietnam] (GVN) in the 1958-1960 period were usually signed "Liberation Forces of the South" or Lao Dong Party. Typical titles were "Letters from Long An Lao Dong Provincial Committee to Rural Compatriots on the Thirty-Ninth Anniversary of the Founding of the Party" and "An Appeal by the Lao Dong Party South Vietnamese Executive Committee to Compatriots in the South." Many of these contained Ho Chi Minh's picture and at least one was issued to mark his birthday. Apparently they served chiefly to advertise the fact that the Lao Dong Party continued to exist in the South.

The NLF leaflet program reached its zenith of utility in mid-1963, after which it declined. The leaflets usually took the form of a two- or four-page

*Excerpts from *Viet Cong: The Organization and Technique of the National Liberation Front of South Vietnam*, M.I.T. Press, Cambridge, Mass., 1966, Appendix B. Reprinted with the permission of M.I.T. Press, copyright holder.

tract containing several thousand words of text; a small leaflet (about 3 by 5 inches) containing a much shorter message; or a slogan slip, which was a strip of paper on which a single slogan was written. The leaflets were usually the work of cadres. The slogan slip was the work of the people themselves, usually as part of a struggle movement, and was a device highly prized by the leadership.

The tract and the miniature leaflet were usually written at the inter-zone agit-prop section and sent to the district or village where they were reproduced and distributed by local cadres. It is difficult to determine the scope of this leaflet activity; a *quy chanh* who had worked in the Kien Hoa provincial agit-prop section said that in September 1961, probably the high point of the NLF leaflet program, the provincial agit-prop section issued 500,000 leaflets of ten different types. An NLF internal report said that the Central Nambo zonal central committee produced three million leaflets dealing with the GVN's April 1961 elections.

The cadre directive stated that leaflets were to be used in areas where we are not able to organize demonstrations. They have the purpose of causing the masses to stand up and struggle. They are used in areas where we have no organization or only a weak one, such as a provincial capital. Butterfly leaflets create a willingness among the people to struggle against the enemy and heighten the prestige of the Revolution. In the areas where we are organized but the enemy still is in control we can use leaflets to make propaganda for our organizations. This should be the main objective in the use of leaflets. But also they should arouse public opinion, create confusion among the people, and give the masses subjects to discuss. . . . Leaflets disseminate only general policies. Detailed treatment of a subject should be done in face-to-face agit-prop work. Do not rely too much on leaflets.

Leaflets were scattered by hand at night by agit-prop teams. They were surreptitiously placed in women's shopping baskets in small-town markets or left in public places, on buses and trains, in schoolrooms, or sent through the mail. Kites and balloons were flown over towns and military posts, carrying leaflets that were scattered by the wind when a mechanism released them from their airborne conveyors. In cities and towns cadres at night would soak leaflets in water and secretly spread them on the roofs of the taller buildings, the morning sun would dry them; they would come loose from the roof tiles and flow over the town. The NLF also employed a special hand grenade that exploded without injuring anyone and scattered leaflets over a wide area.

NFL cadres estimated that in a random leaflet-scattering operation in a GVN-controlled area, not 10 percent got into the hands of the population. Leaflets became less important as the organizational structure developed. A 1964 memorandum noted,

When we started [the NLF] we had no firm foundation and therefore needed many tracts and leaflets. Now we do not need as many. We need not distribute them in all places, only in the towns and in areas where the enemy is in firm control, in army posts, in refugee villages, and among religious groups. We do not need them in the liberated area . . . except when enemy troops come through.

USIA's "LITTLE" MAGAZINE*

By NATHAN GLICK

If educated groups from different cultures share particular interests or characteristics, printed matter such as the magazine representing these interests and characteristics will be better received by their cross-national audience and more likely to be effective in influencing opinion than communications directed at the larger public.

Government sponsorship of magazines for foreign readers is not a new idea. The Soviet Union has been conducting such a program for many decades, and its highly ideological style has been emulated by Communist China and several East European governments. Before *Dialogue*, [a USIA publication launched in the spring of 1968], US publications for foreign audiences were mainly aimed at specific countries or areas. *America Illustrated*, a handsomely designed monthly which resembles *Life* in format, is distributed in the Soviet Union and Poland under a formal cultural exchange agreement. *Topic* is aimed at African readers, *Horizons* at Asians, and a number of USIS posts publish magazines for distribution within a single country. The only early exception to this area-targeted rule was *Problems of Communism*, a bi-monthly survey of developments in the Communist world, which started in 1952 as a product of the cold war but has since become widely regarded in academic circles as the most authoritative journal in its field.

Against this background, *Dialogue* was novel in avoiding any specialization of either audience or subject matter. Its outlook and ambitions were suggested in the editor's "note to the reader" in the first issue, which said in part:

Dialogue addresses itself to what one writer recently called the "intellectual public," those readers who have a compelling interest in ideas, social problems, literature and art. We hope to avoid facile popularization and irrelevant scholarship, and to publish articles that link special knowledge to wider cultural influences or pressing human needs. Our title refers primarily to the continuing discussion among Americans of matters ranging from education and culture to politics and economic development. But there is also a reciprocal character to intellectual discourse which leaps the barriers of geographical frontiers of political systems. One of the redeeming features of man's often melancholy history has been the international fraternity of intellectuals—a common concern for humane values and a common responsiveness to imaginative art. . . . We hope that our magazine will contribute to this international dialogue of ideas and aspirations.

Having been involved in magazine work most of my adult life, and having some knowledge of the short and inglorious histories of many high-minded publications, I was acutely aware of the shadows that could fall between conception and creation. The first shadow requiring exorcism was the widespread suspicion in USIA that no single magazine could meet the interests of readers from very different backgrounds in five

*Excerpts from "USIA's Little Magazine," *Cultural Affairs* 12, Associated Councils of the Arts, New York, 1970.

continents and more than a hundred countries. The response to the first issue provided a rather persuasive answer. Asians, Africans, Latin Americans, Europeans and Canadians—ranging from an avant-garde playwright in Brazil to an army general in Malaysia—seemed equally pleased with the magazine. Clearly, there existed a fairly homogeneous international audience at the university-educated level. None other than Professor Shils had remarked, in an article called “The Intellectual in Developing Nations” which *Dialogue* printed, that the educated classes in such countries have either been trained in the West or taught at home by Westerners or pupils of Westerners; and that their drive toward modernity is strongly influenced by Western standards. Beyond this ecumenical aspect of university education, there is the fact of almost instantaneous international communication which, at least superficially, provides the educated publics around the world with a common background of information and concerns.

Specifically, some of the most important ideas about modernization (economic, political or social) have been spawned in the technologically developed nations and perhaps most of all in the United States, which has the material affluence and political incentive to support a large corps of development specialists in the universities, AID, the World Bank, and elsewhere. Since by far the larger part of *Dialogue's* audience lives in the developing world, and since one of the main purposes of the magazine is to share useful and stimulating ideas, every issue so far has carried at least one article on problems of economic development. These articles have elicited more involved response than those on any other single theme—as judged by letters to the editor, reprints in indigenous publications, and extended comment in newspapers and journals.

* * * * *

At *Dialogue* we are very much aware that those we refer to as intellectuals in our own country and abroad are no longer members of a leisure class, but often excessively busy professionals who have the taste and capacity for intellectual stimulation along with limited time and patience. We have therefore experimented with editorial, visual and typographical approaches intended to make the magazine more attractive and serviceable. Although I am suspicious of the current tendency to view “communications” as a separate and special discipline, the experience of editing *Dialogue* has made me acutely aware of the pitfalls that lie in wait for the international communicator. At the same time it has convinced me that there is a widespread hunger for dialogue (with a small “d”), for a sense of participation in the contemporary issues that cross national boundaries and touch on men’s common concern for social justice and their common responsiveness to imaginative art.

U.S.-SOVIET MAGAZINE PROPAGANDA:

AMERICA ILLUSTRATED AND USSR*

BY ANITA MALLINCKRODT DASBACH

Covert propaganda containing messages that are not favorable to the predispositions of the target audiences may gain the selective attention and interests of the target audiences when built into an overt framework.

PROPAGANDA TECHNIQUES

The messages propagandists use to convey themes aimed at inducing modifications of belief in audiences often are subtle and covert, frequently imbedded deeply in the body of an article. Significant, therefore, is the message's overt framework, built to capture the initial attention and interest of the reader, as well as to convey an impression of its own.

SUBJECT MATTER

An important part of the message's framework is subject matter. For instance, by presenting articles about new developments in various fields of the arts, a propagandist conveys the impression of a cultured communicator. He also gains the attention of readers interested in the arts. Once their attention is won by an article which promises subject matter attractive to them, they begin to read and so are exposed to the theme the propagandist has woven into the article.

What subjects, then, are U.S. and Soviet propagandists presenting to win and hold their audiences and to convey desired impressions? In brief, the 1960 and 1963 samples used in this study show *USSR* decreasing its emphasis on Government and Foreign Relations subjects and increasing emphasis on such subject matter areas as People and Science. Meanwhile, in 1963 *America Illustrated* increased its already heavy emphasis on Arts and Culture while talking somewhat less about Education, Foreign Relations, Government and other areas.

* * * * *

REPRINTS

In addition to subject matter, which can serve to gain reader attention, credibility, which gains reader acceptance, is another important aspect of the framework the propagandist constructs around his message. It has been felt, for instance, that if *America Illustrated* used articles reprinted from national U.S. magazines, Soviet readers would feel they were reading what Americans themselves read, rather than pieces tailored for Soviet consumption and so more "propagandistic." With this philosophy in mind, *America Illustrated*, in the four-issue basic sample covering the

*Excerpts from "U.S.-Soviet Magazine Propaganda:" "*America Illustrated*" and "*USSR*," *Journalism Quarterly*, XLIII, No. 1 (Spring 1966), pp. 73-84. Reprinted with the permission of *Journalism Quarterly*, copyright holder, and the courtesy of the author.

1960 period, used reprints for 24% of the articles it published. By the 1963 period, the reprint rate has gone up to 32% for the basic four-issue sample.

NEGATIVE COMMENT

If *USSR* and *America Illustrated* are overwhelmingly dedicated to building a favorable national self-image, . . . one would expect the magazines' tone to be rosy, or what is termed "putting the best foot forward." This, indeed, is the impression gained from a casual reading of both magazines, as contrasted to, for instance, mass-circulation domestic American magazines.

However, even within the predominantly positive approach of both magazines, a reader spots negative comment. Two questions arise:

How much of the negative comment detracts from the "best foot forward" approach, as by presenting negative contemporary self-image, including even self-criticism?

This content is especially important because it is directly related to credibility, a high-priority goal among propagandists. For instance, many Soviet citizens believe the United States has problems, perhaps partially because their government has often said so. If we do not discuss problems when we write about our country, Soviet readers may feel we are evading the issue. Thus, without candor we may lose credibility. Furthermore by permitting the Soviet government's allegations regarding our problems to go unchallenged we miss an opportunity to put the problems in perspective. However, there are some who argue that if the magazine acknowledges the existence of U.S. problems such as slums, unemployment and racial discord, the Soviet reader will think, "Well, our government was right all along; race relations are a serious problem in the United States. In fact, if the U.S. magazine mentions this problem at all it must be even worse than they say it is, because that's how our government operates." While this argument may have some validity, it seems more risky to ignore social problems, and to avoid the negative comment necessary in their discussion, than to present them in perspective. Furthermore, by doing so, we have the advantage of disarming Soviet readers by our frankness.

What does the negative comment of political significance but of non-contemporary or non-self-critical nature say?

This area of negative comment has significance because it may reveal how propagandists see their nations's past, the world as a whole or a nation's citizens. In discussing these broader aspects having political significance, the use of negative comment lends an air of reality to the magazine. A magazine attempting to portray the life of a nation cannot do it in overwhelmingly rosy tones and expect to be believed. Simple logic says life just isn't like that.

TATZEPAO: MEDIUM OF CONFLICT IN CHINA'S "CULTURAL REVOLUTION"*

BY BARRY M. BROMAN**

The wall poster is one form of mass media which does not depend on a high degree of literacy and availability of receivers, and is one of the most dramatic means of political communication.

One of the oldest forms of communication in China is the *tatzepao* or wall poster (sometimes called the big-character poster). Dating from imperial times when royal edicts were posted on village walls, *tatzepao* have played a variety of communication roles in China.¹ Under the Communists *tatzepao* became an efficient medium of mass persuasion guided by the Propaganda Department of the Central Committee of the Chinese Communist Party (hereafter, the Propaganda Department). In the summer of 1966, as the conflict within China's highest political echelon reached crisis proportions, a new and radically different function was assigned to *tatzepao*.

This paper examines the phenomenon of *tatzepao* as an instrument of conflict during the so-called Proletarian Cultural Revolution. It looks at *tatzepao* as a unique form of mass communication which helps to explain the nature of the recent struggle inside Communist China.

Intimately linked with any discussion of *tatzepao* must be a discussion of the active agents in the cultural revolution, the Red Guards. The study focuses on a critical period of the cultural revolution beginning in June 1966, when Red Guard units began to appear and *tatzepao* emerged as their primary weapon, until early 1967, when the Red Guards were dispersed and the cultural revolution entered a new phase.

* * * * *

Broadly speaking, the cultural revolution was a struggle for the reins of leadership at the apex of the political pyramid. The conflict centered on two rival factions, with Mao-Tse-tung heading a Leninist-Stalinist minority faction. Supported by a small circle of intimates,² Mao managed to survive through the aid of Lin Piao and a substantial segment of the army—and the Red Guards, an organization Mao created in 1966 to prosecute the cultural revolution. Opposed to the Maoists was a diverse group of party faithful which foreign observers have united by the term "anti-Maoist." Under the nominal leadership of Liu Shao-ch'i this group,

*Excerpts from "Tatzepao: Medium of Conflict in China's 'Cultural Revolution,'" *Journalism Quarterly*, 146, No. 1 (Spring 1969), pp. 100-104, 127. Reprinted with the permission of *Journalism Quarterly*, copyright holder, and the courtesy of the author.

**The author wishes to thank Professor Alex S. Edelstein of the School of Communications and Henry G. Schwartz of the Far Eastern and Russian Institute for their assistance and comments.

which is believed to include the majority of party leaders, sought to follow a policy line toward modernity that the Maoists branded "revisionist."

* * * * *

With large segments of the official media "captured" by anti-Maoists, Mao Tse-tung faced a difficult task in attempting to reach the masses whom he considered the crucial link in effecting his "revolution." The monolithic structure of the Propaganda Department further frustrated the Maoists since the department functioned hierarchically down to the village level through millions of cadres making up a "closed" ³ communications network. The system oriented all provincial propaganda departments toward Peking whence every important policy message originated. This structure was of critical political importance. Maoist attempts to regain control of the Propaganda Department apparently failed, necessitating the creation of a rival apparatus. The Red Guards emerged as the counterpart to the official propagandists, in function if not in form, and *tatzepao* became their primary medium.

Tatzepao brought the power struggle into the open on May 25, 1966, when, symbolically, the "first" wall poster of the cultural revolution was written. Its primary author was Nieh Yuan-tzu, a woman teaching assistant in the philosophy department at Peking University who, acting apparently on Mao's personal instructions, attacked the University's president and others. Among the indictments was a charge that University officials had discouraged support for Mao and discouraged the writing of *tatzepao*:

To counter-attack the sinister gang which has frantically attacked the Party, socialism, and Mao Tse-tung's thought is a life-and-death class struggle. The revolutionary people must be fully aroused to vigorously and angrily denounce them, and to hold big meetings and put up big-character posters is one of the best ways for the masses to do battle.⁴

This poster signaled a deluge of *tatzepao* and set the stage for the pattern of conflict to follow. Mao Tse-tung personally was credited with having "discovered (this) the first Marxist-Leninist big-character poster in the country and approved its publication for the country and the world."⁵

Soon more posters appeared attacking anti-Maoists by name. Typical of these was a poster entitled "Important Directive Given by Chairman Mao at the Central Committee Cultural Revolution Meeting on 8 September (1966)" in which two powerful anti-Maoists were attacked.⁶

... Unlike the official media, which referred vaguely to "those persons in authority who are taking the capitalist road," *tatzepao* attacked the anti-Maoists by name, frequently citing "crimes" of doubtful authenticity.

... The conflict thus was brought into the open through *tatzepao* in a manner that left those condemned defenseless against the relentless and often anonymous charges.

* * * * *

The choice of *tatsepao* by Mao as the medium through which to “reveal” his enemies to the people is understandable. Eight years earlier he had expressed his faith in the utility of the medium as an instrument of conflict.⁷

The big-character poster is an extremely useful new type of weapon. It can be used in cities and the countryside, government and other organizations, army units and streets, in short, wherever the masses are. Now that it has been widely used, people should go on using it constantly.⁸

Accordingly, on August 5, 1966, as the battle lines of the conflict were being drawn at the Eleventh Plenary Session of the Central Committee of the Chinese Communist Party, a wall poster bearing Mao's own signature appeared. Entitled “Bombard the Headquarters—My Big-Character Poster,” according to a Maoist source, it “blasted the lid off the struggle between the proletarian revolutionary line and the bourgeoisie headquarters [i.e., the anti-Maoists] which had existed in the party for a long time.”⁹

* * * * *

The Maoists hoped that the pressures brought about by the *tatsepao* and Red Guard violence would reduce the effectiveness if not the will of the anti-Maoists, but the degree to which the leaders of the cultural revolution could control the Red Guards decreased rapidly as schools closed and millions of youths surged forward to wage “revolution.” In short, the campaign got out of hand.

Apart from the small group that was charged with directing the cultural revolution there was little direct control by Maoist forces over the Red Guards. What controls that existed were rapidly dissipated in the days following the massive August rallies as the ranks of the Red Guards expanded faster than the Maoist organization could assimilate them. At this point Red Guard newspapers emerged in an attempt to give direction to the increasingly ill-disciplined youths who roamed throughout China leaving havoc in their wake. The appearance of these newspapers signaled the institutionalization of the cultural revolution.

The newspapers became the internal control medium for the mobilization of youths and a link between the Maoists' leadership and the rank-and-file Red Guards. They enjoyed a wide geographical distribution and established policy for the Red Guards. The small-circulation publications were circulated by hand to cadres and to a lesser extent to the Red Guard masses.¹⁰
